KEY TO PRONUNCIATION.

ä	as in ale, fate. Also see <i>ø</i> , below.	D	as in the Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then, this.
“	“ senate, chaotic. Also see <i>ø</i> , below.	g	“ “ go, get.
“	“ glare, care.	G	“ “ the German Landtag, and <i>ch</i> in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
“	“ am, at.	H	as <i>j</i> in the Spanish Jijona, <i>g</i> in the Spanish gila; where it is a fricative somewhat resembling the sound of <i>h</i> in English hue or <i>y</i> in yet, but stronger.
“	“ arm, father.	hw	“ <i>wh</i> in which.
“	“ ant, and final <i>a</i> in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> (<i>ü</i>).	K	“ <i>ch</i> in the German ich, Albrecht, and <i>g</i> in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of <i>h</i> in hue, or <i>y</i> in yet; or the sound made by beginning to pronounce a <i>k</i> , but not completing the stoppage of the breath. The character <i>k</i> is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of <i>kh</i> in the word Khan.
α	“ “ final, regal, where it is of a neutral or obscure quality.	n	as in sinker, longer.
“	“ all, fall.	ng	“ “ sing, long.
“	“ eve.	N	“ “ the French bon, Bourbon, and <i>m</i> in the French Etampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce ‘onion’ without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <i>N</i> , as in the case of São Antão.
“	“ elate, evade.	sh	“ “ shine, shut.
“	“ end, pet. The characters <i>ě</i> , <i>ä</i> , and <i>ä</i> are used for <i>ä</i> in German, as in Gärtner, Gräfe, Hähnel, to the values of which they are the nearest English vowel sounds. The sound of Swedish <i>ä</i> is also indicated by <i>ě</i> .	th	“ “ thrust, thin.
“	“ fern, her, and as <i>i</i> in sir. Also for <i>ö</i> , <i>œ</i> , in German, as in Göthe, Goethe, Ortel, Oertel, and for <i>eu</i> and <i>œu</i> in French, as in Neufchâtel, Crèveceur; to which it is the nearest English vowel sound.	TH	“ “ then, this.
“	“ agency, judgment, where it is of a neutral or obscure quality.	zh	as <i>z</i> in azure, and <i>s</i> in pleasure.
“	“ ice, quiet.		An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kāz'm (chasm).
“	“ quiescent.		Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
“	“ ill, fit.		When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. See the article on PRONUNCIATION.
“	“ old, sober.		
“	“ obey, sobriety.		
“	“ orb, nor.		
“	“ odd, forest, not.		
“	“ atom, carol, where it has a neutral or obscure quality.		
“	“ oil, boil, and for <i>eu</i> in German, as in Feuerbach.		
“	“ food, fool, and as <i>u</i> in rude, rule.		
“	“ house, mouse.		
“	“ use, mule.		
“	“ unite.		
“	“ cut, but.		
“	“ full, put, or as <i>oo</i> in foot, book. Also for <i>ü</i> in German, as in München, Müller, and <i>u</i> in French, as in Buchez, Budé; to which it is the nearest English vowel sound.		
“	“ urn, burn.		
“	“ yet, yield.		
“	“ the Spanish Habana, Córdoba, where it is like a <i>v</i> made with the lips alone, instead of with the teeth and lips.		
“	“ chair, cheese.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

FONTANES, fɔ̃n'tan', LOUIS, Marquis de (1757-1821). A French poet and political orator. He was born at Niort, March 6, 1757, and was of an ancient Protestant family of Languedoc. He went to Paris while still a youth, and at twenty-one had attracted attention as poet by *Le cri de mon cœur* (1778) and *La forêt de Navarre* (1778). A little later he published a scholarly translation of Pope's *Essay on Man* (1783). During the early years of the Revolution he was active as a moderate Republican journalist, and before the fall of Robespierre was in hiding for a time. Later he was constrained to take refuge in Hamburg, whence he went to London, and became a close friend of Chateaubriand. While in England he published a much-admired imitation of Gray's "Elegy," *Le jour des morts* (1796). He returned to France in 1799, was reinstated in the Institute, of which he had been made a member in 1795, and, warmly espousing the cause of Napoleon, was made member of the legislative body (1802-10), of which he became president in 1804. Here he developed great oratorical talent in praise of the First Consul and Emperor. He was advanced to the Senate (1810), but he adapted himself readily to the Restoration after Leipzig, drew up Napoleon's act of abdication (1814), and was made peer by Louis XVIII. He died in Paris, March 17, 1821. Fontanes's works, edited by Sainte-Beuve in two volumes (1837), are models of elegant and correct diction, and show sound literary judgment.

FONTANGES, fɔ̃n'tanzh', MARIE ANGÉLIQUE DE SCORAILLE DE ROUSSILLE, Duchesse de (1661-81). A mistress of Louis XIV. She was born at the Château of Croprières in Auvergne, as the daughter of the Marquis de Roussille. Maid of honor to Madame, the Duchess of Orleans, she attracted the attention of the King, who made her Duchesse de Fontanges. She bore the King a son, and shortly afterwards died at the Abbey of Port Royal.

FONTARABIA. See FUENTERRABIA.

FONTENAY, fɔ̃nt'ná'. A small town near Auxerre, in Lower Burgundy. It is memorable for the battle fought there in 841, between the three sons of Louis the Pious, which decided the fate of the Carolingian Empire. The Emperor

Lothair, who was defeated, was obliged in 843 to consent to divide the Empire with his two brothers by the Treaty of Verdun (q.v.).

FONTENAY-LE-COMTE, fɔ̃nt'ná'le-kɔ̃nt'. The capital of an arrondissement in the Department of Vendée, France, situated on both banks of the Vendée, 27 miles northeast of La Rochelle (Map: France, E 5). It is an old-fashioned town, with the two fine Gothic churches of Notre Dame and Saint Jean, and in the public square a fountain in Renaissance style, from which the town derives its name; there are also a college and a handsome theatre. There are linen and cloth and saw mills, and three important annual fairs are held. Population, in 1901, 10,512. The town suffered considerably during the religious wars, and was captured by the Royalists in 1793.

FONTENAY-MAREUIL, fɔ̃nt'ná'mà'rè'y', FRANÇOIS DU VAL, Marquis de (c.1594-1665). A French soldier, diplomat, and historian. He was brought up at the Court of Louis XIII.; served with Mayenne in Spain; with Nevers at Ratisbon; under Boisdapin at the siege of Soissons (1617); in 1619 in Normandy; at Saint-Jean d'Angély, Clérac, and Montauban (1621); at Saint-Antoine and Montpellier (1622); at the Ile de Ré (1627); and at the sieges of La Rochelle (1628), of Privas and of Alais (1629). From 1630 to 1633 he was Ambassador to England. After taking part in various campaigns against the Imperialists and Spaniards, he was Ambassador at Rome from 1640 to 1650. His memoirs were published at Paris in 1826.

FONTENELLE, fɔ̃nt'nél', BERTRAND LE BOVIER (1657-1757). A French scientist, philosopher, poet, and dramatist of acute wit and great power of popular presentation. He was born at Rouen, February 11, 1657, and was a nephew of Corneille. He was trained by the Jesuits, studied law, but abandoned it for literature and science, in which he soon earned distinction. He was secretary of the Academy of Sciences from 1699 to 1741, and edited its *Mémoires* and *Eloges* on deceased members with admirable care. His dramatic and poetic work is negligible, but his literary studies on the French stage before Corneille and the origin of fables are still of interest. His *Histoire des oracles* (1687), *Entretiens sur la pluralité des mondes* (1686), and the *Dialogues des*

morts (1683), imitating Lucian and suggesting Lancelotti, were once very popular, and aided in spreading the scientific and rationalistic spirit. He died in Paris, January 9, 1757. He had an acute mind, a dry, epigrammatic style, a calm judgment, a didactic temper, a kindly character. The best edition of his works is in 3 vols. (Paris, 1818). Consult Faguet, *Dieu huitième siècle* (Paris, 1894), and the brief but acute criticism in Lanson, *Histoire de la littérature française* (5th ed., Paris, 1898).

FONTENOY, fɔ̃t'no' (older form *Fontenet*, from Lat. *fontanus*, pertaining to springs, from *fons*, fountain). A village of Belgium, in the Province of Hainaut, five miles southwest of Tournai. Here, on May 11, 1745, the French, 55,000 strong, under Marshal Saxe, defeated an equal number of English, Hanoverians, and Dutch under the Duke of Cumberland. The fight was obstinate to the last, and was decided only by a smashing charge of the Household Troops and the famous Irish Brigade. The Allies lost 10,000 men, the French 7000. Coming at the same time as the threatened Stuart invasion, the defeat was a great blow to England.

FONTEVRAULT, fɔ̃t've-rɔ' (Fons Ebraldi—the well of Saint Evrault). A town in the Department of Maine-et-Loire, France, on the Vienne, eight miles southeast of Saumur (Map: France, G 4). Population, in 1901, 2352. It is celebrated for the remains of the famous abbey founded in 1099 by Robert d'Arbrissel, a Breton monk. It consisted of five churches, a monastery, a nunnery, a magdaleneum, and a hospital. One church remains, a splendid example of twelfth-century architecture, of which only a part is now devoted to divine service. It contained the tombs of several members of the royal Plantagenet family of England, and still possesses the effigies of Henry II. and his Queen Eleanor of Aquitaine, of Richard Cœur de Lion, and of Isabella of Angoulême, wife of King John. The Tour d'Evrault, the sixteenth-century chapter-house, the refectory, and the cloisters are of great archaeological interest. In 1804 the buildings were inclosed by walls, and converted into a huge penitentiary and industrial prison for eleven neighboring departments, with accommodation for 2000 prisoners. Napoleon III., in 1867, occasioned a national outburst of indignation by offering the Plantagenet statues to Queen Victoria, a vandal act that was frustrated by the refusal of the prison director to deliver them to the English agent. Consult Edouard, *Fontevault et ses monuments* (2 vols., Paris, 1875).

FONTEVRAULT, ORDER OF. A monastic Order following the Benedictine rule, founded by Robert d'Arbrissel. He was born in 1047, and took his doctor's degree in Paris. As Vicar-General of the Diocese of Rennes, he devoted himself zealously to the extirpation of clerical concubinage and simony. Later he took up the life of a hermit in the forest of Craon, between Anjou and Brittany. The fame of his sanctity attracted disciples, whom in 1094 he formed into a community under the rule of Saint Augustine at La Roe. He received special permission from Pope Urban II. to preach the Crusade; but in 1099 he founded a community at Fontevault (q.v.) for persons of both sexes who preferred a life of penance at home. As several houses developed, of which those for women were especially dedi-

cated to the Blessed Virgin, Robert placed those for men also under the jurisdiction of the Abbess of Fontevault as superior of the whole Order, representing the heavenly patroness. The first abbess was Hersende, a kinswoman of the Duke of Brittany. They were pledged to observe the Benedictine rule in its full rigor, not eating flesh even in sickness. Paschal II. confirmed the Order in 1106 and 1113. The founder died in 1117, after establishing numerous cloisters; more than sixty arose after his death on the same model, principally in France, though a few extended to England and Spain. The Order ultimately declined, in spite of the efforts at reform of three of its abbesses, Mary of Brittany (1477), Renée of Bourbon (1507), and Antoinette of Orleans (1571-1618), and finally became extinct.

FONT'HILL ABBEY. See BECKFORD.

FONTPERTIUS, fɔ̃t'pɛr'ty', ADALBERT FROUT DE (1825—). A French writer, born at Rennes. He entered the marine artillery, but left it for the civil service, and was chief prefect of the Division of Eure-et-Loir, from 1853 to 1865. His writings include a number of essays for scientific and economic magazines, and two books on social subjects, besides *Etudes de littérature étrangère* (1859), *Les Français en Amérique*, and works upon Canada, the United States (1873), and the English in India.

FONVIELLE, fɔ̃t'vyɛl', LOUIS EUGÈNE, Knight of (1655-1711). A French pirate, born at Thouars (in the present Department of Deux-Sèvres). He turned buccaneer in 1677, and as a chief, in command of his own vessel, cruised among the West Indies, attacking and plundering the Spaniards. He was a lieutenant in the French Navy from 1679 to 1681, when he was elected principal chief of the buccaneers, whom he continued to hold in readiness to aid the French at Santo Domingo. When the French expedition against Cartagena was organized by Baron de Pointis in 1697 he commanded 600 buccaneers in the force placed at the disposal of the expedition by Ducasse, the Governor of Santo Domingo. In 1702 he helped Ducasse to defeat a superior English fleet under Admiral John Benbow. He accompanied the unsuccessful French expedition against Rio de Janeiro in 1710, and after his surrender was treacherously murdered by the Spaniards.

FONVIELLE, WILFRID DE (1828—). A French aéronaut, meteorologist, and author. He was born at Paris, and in his early life was a teacher of mathematics. Since 1858 he has been distinguished as an aéronaut. He made numerous balloon ascents with Tissandier for meteorological purposes, and in November, 1870, during the siege of Paris, he escaped from the city in a balloon, and proceeding to London gave a series of lectures on the benefits of a republican form of government. His principal scientific works are: *L'homme fossile* (1865); *Les merveilles du monde invisible* (1866); *Eclairs et tonnerres* (1867), translated into English under the title of *Thunder and Lightning*; *L'astronomie moderne* (1868); *Histoire de la lune* (1886); and *Mort de faim* (1886). An account of the balloon ascents made by Fonvielle, Glaisher, and others appeared in French in 1870, and an English translation was published in 1871 under the title of *Travels in the Air*. In addition to the

above-mentioned works Fonvielle has written several political pamphlets, and *Aventures aériennes* (1876) and *La prévision du temps* (1879).

FOO-CHOW, fōō'chow'. See FU-CHOW.

FOOD (AS. *fōda*, Icel. *fæþi*, Goth. *fōdeins*, food; connected with Gk. *φάειν*, *pateisthai*, to feed). The articles of animal and vegetable origin that form the diet of man. Sometimes this term includes also spices, vinegar, and similar articles which, strictly speaking, are not foods, but are more properly called food accessories or condiments. A study of food and the feeding of the body, i.e. nutrition, should include knowledge of the requirements and the chemical composition of the body, the chemical composition, the laws of energy and of the metabolism of matter. Account must be taken of methods of preparing and cooking foods, of the hygiene, the comparative pecuniary value, the quantities of foods eaten, etc. Some of these subjects require investigations by specially devised methods; others are carried on by the help of physiological chemistry, bacteriology, and other related sciences. From the standpoint of nutrition, food may be defined as substance that builds tissue or yields energy when taken into the body. The most healthful food is that which is best fitted to the needs of the user; the cheapest food is that which furnishes the largest amount of nutriment at the least cost. In general, the best food is that which is both the cheapest and the most healthful.

The substances that nourish the body are very similar in chemical composition to those that compose it. They are made up of from fifteen to twenty chemical elements, the most abundant of which are oxygen, hydrogen, carbon, nitrogen, calcium, phosphorus, and sulphur. The elements are combined in a great variety of ways in the compounds of both the food and the body. Five general classes of these substances are made as follows: Water, mineral matter, protein, fats, and carbohydrates, the first two of which are called inorganic, the other three organic. In addition to material supplied in food, the body requires the oxygen of the air for the oxidation of nutrients and the production of energy.

INOORGANIC CONSTITUENTS. Water is the most abundant of the substances mentioned. It is a component part of all the tissues, and forms over 60 per cent. by weight of the body of the average man. Though very important physiologically, it neither builds tissue nor yields energy. Other food ingredients which yield little or no energy, and yet are indispensable to the body, are the mineral matters, i.e. those substances that remain as ash when body or food tissue is burned. They consist mainly of phosphate of lime or calcium phosphate, the mineral basis of bone, and numerous compounds of potassium, sodium, magnesium, and iron. They form only five or six per cent., by weight, of the body, and are found chiefly in the bones and the teeth, but are present in the other tissues and also in solution in the various fluids.

ORGANIC CONSTITUENTS. The organic compounds are so called because they occur principally in the organic, i.e. the animal and vegetable world. They all contain carbon, oxygen, and hydrogen, in varying proportions. Some also contain nitrogen, phosphorus, sulphur, or other

elements. **Protein Group.**—The protein group includes all compounds that contain nitrogen; for example, the lean and gristle of meat, the white of eggs, and the gluten of wheat. Protein forms about 18 per cent., by weight, of the body of the average man. Among the protein constituents of foods, the albuminoids, being the true tissue-formers, are the most important. Protein is the organic basis of bone, muscle, and other tissues, and is essential to the body structure. It is also used as fuel—that is, is burned in the body to yield energy—and is to some extent transformed into fat and stored in the body, but these are its less important uses. The protein compounds are most abundant in some of the animal foods, as lean meat, though the cereals contain them in considerable, and dried peas and beans in large, proportions. **Fats.**—Fats occur chiefly in animal foods, as meats, fish, butter, etc., but in considerable quantities in some cereals, notably oatmeal and maize (whole kernel), and in various nuts. They are also abundant in some vegetable products, such as olives and cottonseed, from which they are expressed as oil. In our bodies, and in those of animals, fats occur in minute particles scattered through the various tissues, and in masses under the skin, and in other localities. The amount of fat in the body varies greatly with food, exercise, age, and other conditions. When more food is taken than is necessary for immediate use, part of the surplus may be stored in the body. The protein and fat of food may thus become body protein and body fat; sugar and starch of food are changed to fat in the body and stored as such. When the food-supply is short, this reserve material is drawn upon for supplementary fuel. Fats form about 15 per cent., by weight, of the body of an average man. **Carbohydrates.**—The carbohydrates, which include such compounds as starches, different kinds of sugar, and the cellulose or fibre of plants, are found chiefly in the vegetable foods, like cereal grains and potatoes, form only a very small proportion of the body tissues—less than one per cent. Milk, however, contains considerable amounts of milk-sugar, which is a carbohydrate. Starches and sugars, which are very abundant in ordinary vegetable food materials, are important food substances, because they are easily digested, and because they form an abundant source of energy. They may be and often are transformed into fat in the body.

To a greater or less extent, the different nutrients can do one another's work. If the body has not enough of one kind of fuel, it can use another. But while protein may be burned in the body in the place of fats and carbohydrates, neither of the latter can take the place of the albuminoids in building and repairing the tissues. By being consumed themselves, however, they protect the albuminoids from consumption.

REFUSE. Food as it is bought at the market, or even as it is served on the table, contains more or less of materials—such as the bones of meat and fish, the shells of eggs, and the skins and seeds of fruits and vegetables—which we cannot or do not eat, and which would have little or no nutritive value if we did eat them. In discussing the chemical composition of foods such portions are usually counted as refuse, but they make an important item when we consider the actual cost of the nutrients of food. The mate-

rials grouped together as refuse contain, in part, the same ingredients as the edible portion, though usually in very different proportions. Thus bones are largely mineral matter, with some fat and protein; egg-shells are almost entirely mineral matter; bran of wheat has a high content of fibre or woody material.

THE BODY AS A MACHINE. Blood and muscle, bone and tendon, brain and nerve—all the organs and tissues of the body—are built from the nutritive ingredients of food. With every motion of the body, with the exercise of feeling and of thought, material is consumed and must be resupplied by food. In a sense, the body is a superior machine, and, like other machines, it requires material to build up its several parts, to repair them as they are worn out, and to serve as fuel. In some ways it uses this material like a machine; in others it does not. The steam-engine gets its power from fuel; the body does the same. In the one case, coal or wood, in the other food, is the fuel. In both cases, the energy—the potential energy—which is latent in the fuel is transformed into heat and power. When coal is burned in a furnace, part of its potential energy is transformed into the mechanical power which the engine uses for its work; the rest is wasted in the heat that the engine does not utilize. Likewise the potential energy of the food is transformed in the body into heat and mechanical power. The mechanical power is employed for muscular work. The heat is used to keep the body warm, and when more is generated than is needed for that purpose it is wasted, as in the case of the engine. However, the body is much more economical in the use of fuel than any engine. One important difference between the human machine and the steam-engine is that the

temperature. From the increase in the temperature of the water the amount of heat liberated is calculated. The unit commonly used to express the energy value of food is the calorie, i.e. the amount of heat which would raise the temperature of one kilogram of water 1° C., or, what is nearly the same thing, one pound of water 4° F. Instead of this, a unit of mechanical energy, the foot-ton, for instance, may be used. This represents the force required to raise a weight of one ton to the height of one foot. One calorie is equal to very nearly 1.54 foot-tons; that is to say, one calorie of heat, when transformed into mechanical power, would suffice to lift one ton 1.54 feet. Taking our common food materials as they are used in ordinary diet, the following general estimate has been made for the energy furnished to the body by one gram or one pound of each of the classes of nutrients:

Protein, fuel value, 4 calories per gram, or 1820 calories per pound.

Fats, fuel value, 8.9 calories per gram, or 4040 calories per pound.

Carbohydrates, fuel value, 4 calories per gram, or 1820 calories per pound.

When we compare the nutrients in respect to their fuel value—that is, their capacities for yielding heat and mechanical power—it will be seen that a pound of protein of lean meat or albumen of egg is just about equivalent to a pound of sugar or starch, and a little over two pounds of either would be required to equal a pound of the fat of meat or butter or of body fat.

What has thus far been said about the ingredients of food, and the ways they are used in the body, may be briefly summarized in the following scheme:

NUTRITIVE INGREDIENTS (OR NUTRIENTS) OF FOOD

Food as purchased contains:	{ Edible portion..... e.g. flesh of meat, yolk and white of eggs, wheat flour, etc. { Refuse. e.g. bones, entrails, shells, bran, etc.	Water.
		{ Nutrients..... { Protein. Fats. Carbohydrates. Mineral matters.

USES OF NUTRIENTS IN THE BODY

Protein..... e.g. white (albumen) of eggs, curd (casein) of milk, lean meat, gluten of wheat, etc.	Forms tissue.....	{ All serve as fuel to yield energy in the forms of heat and muscular power.
Fats..... e.g. fat of meat, butter, olive oil, oils of corn and wheat, etc.	Are stored as fat.....	
Carbohydrates..... e.g. sugar, starch, etc.	Are transformed into fat..	
Mineral matter (ash)..... e.g. phosphates of lime, potash, soda, etc.	Share in forming bone, assist in digestion, etc.	

former is self-building, self-repairing, and self-regulating. Another is that the material of which the engine is built is very different from that which it uses for fuel, but part of the material which serves the body for fuel also builds it up and keeps it in repair. Furthermore, the body can use its own substance for fuel; the steam-engine cannot.

The fuel value of food may be readily determined by burning samples in a bomb calorimeter, in an atmosphere of oxygen to secure ready and complete combustion. The heat given off passes through the walls of the bomb, and is taken up by a known volume of water of known

The following table shows the average composition of a number of the more common materials. For the composition of others, see BUTTER; EGGS; FRUIT; MEAT; MILK; CHEESE; NUTS; VEGETABLES; WHEAT; CORN; BUCKWHEAT; FIGS; etc.

DIGESTIBILITY. Not only is composition considered in valuing a food, but digestibility also. Digestibility is a term used to indicate the ease or difficulty with which a food parts with its nutrients to the body in passing through the digestive tract. The changes which food undergoes in digestion are brought about by ferments which are secreted by the digestive organs. (See

TABLE I.—AVERAGE COMPOSITION OF SOME COMMON AMERICAN FOOD PRODUCTS

* Plain confectionery not containing nuts, fruit, or chocolate.

† Such vegetables as potatoes, squash, beets, etc., have a certain amount of inedible material, skin, seeds, etc. The amount varies with the method of preparing the vegetables, and cannot be accurately estimated. The figures given for refuse of vegetables, fruits, etc., are assumed to represent approximately the amount of refuse in these foods as ordinarily prepared.

‡ Fruits contain a certain proportion of inedible materials, as skin, seeds, etc., which are properly classed as refuse. In some fruits, as oranges and prunes, the amount rejected in eating is practically the same as refuse. In others, as apples and pears, more or less of the edible material is ordinarily rejected with the skin and seeds and other inedible portions. The edible material which is thus thrown away, and should properly be classed with the waste, is here classed with the refuse. The figures for refuse here given represent, as nearly as can be ascertained, the quantities ordinarily rejected.

§ Milk and shell.

¶ The average of five analyses of cereal coffee grain is: Water 6.2, protein 13.3, fat 3.4, carbohydrates 72.6, and ash 4.5 per cent. Only a portion of the nutrients, however, enter into the infusion. The average in the table represents the available nutrients in the beverage. Infusions of genuine coffee and of tea like the above contain practically no nutrients.

ALIMENTARY SYSTEM; DIGESTION, ORGANS OF.) The ptyalin of saliva in the mouth changes insoluble starches into sugar. The food does not remain in the mouth for a long time, but never-

it has been calculated that on an average the different groups into which food may for convenience be divided have the following coefficients of digestibility and fuel value per pound:

TABLE II.—COEFFICIENTS OF DIGESTIBILITY AND FUEL VALUE PER POUND OF NUTRIENTS IN DIFFERENT GROUPS OF FOOD MATERIALS

KIND OF FOOD	Protein		Fat		Carbohydrates	
	Digestibility	Fuel value per pound	Digestibility	Fuel value per pound	Digestibility	Fuel value per pound
	Per cent.	Calories	Per cent.	Calories	Per cent.	Calories
Meats and fish.....	97	1,940	95	4,040	98	1,730
Eggs.....	97	1,980	95	4,090	98	1,730
Dairy products.....	97	1,940	95	3,990	98	1,730

Total food (of mixed diet).....	92	1,820	95	4,050	97	1,820

theless the action of the saliva is considerable. Saliva also helps to prepare the food for the stomach by moistening it and making its texture such that the gastric juices of the stomach may readily act upon it. The gastric juice acts upon protein, the pancreatic juice of the intestine (see PANCREAS) upon protein, fat, and carbohydrates. All the digestive juices are assisted by a fine division of the food in chewing and by muscular contractions, called the peristaltic action of the stomach and intestine. These latter motions help to mix the digestive juices and their ferments with the food. The otherwise insoluble nutrients of food are rendered soluble by digestion. The digested food finds its way through the walls of the alimentary canal, and in this passage and later undergoes remarkable changes. When finally the blood, supplied with nutrients of the digested food and laden with the oxygen from the lungs, is propelled from the heart all over the body, it is ready to furnish the organs and tissues with the materials and energy needed for the various functions. At the same time it carries away the waste which the exercise of these functions has produced. The living body tissue has the power of choosing the necessary materials from the blood and building them into its own structure. Just how this is done cannot be explained. That portion of the food which the digestive juices cannot dissolve, or which for some reason escapes digestion, is periodically excreted as *fæces*. This material includes not only indigestible material and particles of undigested food, but also the so-called metabolic products, i.e. residues of the digestive juices, bits of the lining of the alimentary canal, etc. For discussions of other excretory products, see URINE; SWEAT; RESPIRATION, ORGANS OF.

The digestibility of any food may be learned most satisfactorily by experiments with man, although experiments are also made by methods of artificial digestion. In the experiments with man both food and *fæces* are analyzed. Deducting the amounts of the several nutrients in the *fæces* from the total amounts of each nutrient consumed shows how much of each was digested. The results are usually expressed in percentages, and spoken of as coefficients of digestibility. From a large number of experiments with man

By the aid of these factors and the figures for the composition of food, the digestible nutrients in different materials may be calculated, as has been done in Table III. In making the calculations the further assumption is made that 75 per cent. of the ash is digestible.

As a general rule, carbohydrates are more completely digested than protein and fats, and hence are more fully available for use in the body; and protein of animal foods, as meat, fish, milk, and eggs, is more digestible than that of vegetable foods. Fats are probably less digestible than most forms of protein and carbohydrates. Other things being equal, foods furnishing nutrients which can be most easily and completely utilized by the body are the most desirable, since they will not bring unnecessary exertion to the various organs. Many kinds of food which in their natural state hold the most valuable nutrients in such form that the digestive juices cannot easily work upon them are so changed by the heat of cooking that they become easily digestible. Thus the importance of proper cooking can hardly be overestimated. Things which please the palate stimulate the flow of the digestive juices; for this reason food should be made appetizing. An attractive diet pleases the æsthetic sense; hence refinement in food habits is as desirable as in other phases of our daily life. The sense of comfort and satisfaction produced by even the appearance of food well cooked and served is of indisputable value. Fortunately such satisfaction is within the reach of almost all.

EASE AND QUICKNESS OF DIGESTION. The terms digestible, indigestible, etc., as used above, refer simply to the food which is or is not available for the general nourishment of the body after the process of digestion is completed. In common parlance, however, they are used more loosely as referring to the ease and quickness of digestion, and to the general wholesomeness of food. One kind of food, bread, for instance, is spoken of as 'simple' and 'digestible,' and another, like fruit cake, as 'rich' and 'indigestible.' There is often much practical truth behind such statements, though little is definitely known concerning the time or labor required to digest different kinds of food. Food does not ordinarily

pass from the stomach into the intestine until it has been reduced to a liquid or semi-liquid condition. The length of time required for different foods to leave the stomach has recently been studied by Penzoldt, among others, with healthy men. He found that the amount and consistency of food have a marked influence on the rate of digestion in the stomach. According to his investigations, fluids leave the stomach more rapidly than other materials. Hot drinks do not leave the stomach more quickly than cold ones, nor does the quantity have much effect. Solid matter in solution or suspension delays the passage of fluid from the stomach somewhat. The consistency of solid foods thus seems to have more effect upon digestibility than the amount consumed. The quantity eaten increases the

length of time the material remains in the stomach, but not proportionally.

To select a few examples of the time required for foods to leave the stomach: Two eggs (raw, poached, or in the form of an omelet), seven ounces of sweetbreads, ten moderate-sized oysters, seven ounces of white fish or three and one-half ounces of white bread, cauliflowers, or cherries, each required two to three hours to digest. Eight and one-fourth ounces of chicken, nine ounces of lean beef, six ounces of boiled ham, three and one-half ounces of roast veal or beefsteak, five and one-third ounces of coarse bread, boiled rice, carrots, spinach, radish, or apple, left the stomach in three to four hours. Nine ounces of smoked tongue, three and one-half ounces of smoked beef, nine ounces of roast goose, five and

one-third ounces of string-beans, or seven ounces of pease porridge, left the stomach in four to five hours.

Generally speaking, the most readily digested animal foods were materials of soft consistency. White meats—for example, chicken—leave the stomach more quickly than red meats or dark meats—for instance, duck. The method of cooking also exerts a very marked influence on stomach digestion. Fresh fish was found to be more readily digested than meats. As regards vegetable foods in general, the consistency and the amounts of solid material were again the principal factors affecting the time required for digestion in the stomach. Mealy potatoes, for instance, were more easily digested than waxy potatoes, and mashed potato more readily than potato cut up in pieces. Fine bread was more quickly digested than coarse bread. There was not much difference in the time required for bread-crust, bread-crumbs, toast, new bread, and stale bread to digest in the stomach, provided all were equally well chewed.

It must be remembered that digestion continues in the intestine, and that the total time required for the digestion and absorption of the nutrients in any given food material is not shown by such experiments as those just mentioned. They find their chief application in prescribing a diet for invalids, as in such cases it is often desirable to require of the stomach only a limited amount of work.

AGREEMENT OF FOOD WITH INDIVIDUALS. Digestibility is often confused with another very different thing, namely, the agreeing or disagreeing of food with the person who eats it. Different persons are differently constituted with respect to the chemical changes which their food undergoes and the effect produced, so that it may be literally true that 'one man's meat is another man's poison.' Milk is for most people a very wholesome, digestible, and nutritious food, but there are persons who are made ill by drinking it. They should avoid it. Some persons have to avoid strawberries. Indeed, cases in which the most wholesome kinds of food are hurtful to individual persons are, unfortunately, numerous. Every man must learn from his own experience what food agrees with him and what does not.

How much harm is done by the injurious compounds sometimes formed in the body from ordinarily wholesome foods is seldom realized. Physiological chemistry is revealing the fact that these compounds may affect even the brain and nerves, and that some forms of insanity are caused by products formed by the abnormal transformations of food and body material.

METABOLISM EXPERIMENTS. As already stated, a knowledge of food and its uses in the body is obtained from studies of composition, digestibility, etc., and from complicated experiments, in some of which the balance of income and outgo of matter and energy is studied. The latter are called metabolism experiments, the balance of matter being measured in terms of nitrogen, or of nitrogen and carbon, and sometimes other elements also, and the balance of energy being measured in terms of heat. In determining the balance of income and outgo of nitrogen, special attention is paid to the amounts of this constituent in food, urine, and feces. When the balance of carbon is also taken into account, a res-

piration apparatus is very convenient and almost necessary. This apparatus permits of the measurement and analysis of the respiratory products, since these contain a large part of the carbon (as carbon dioxide) excreted from the body. Various forms of respiration apparatus have been devised within the last fifty years, among the most important being those invented by Pettenkofer and Voit, in Munich. They consist of metal-walled chambers, large enough for the subject (sometimes a man, sometimes a dog, sheep, or other animal) to live in comfortably for several days, and are furnished with devices for pumping air through, and measuring and analyzing it as it enters and as it leaves the chamber. With such an apparatus it is possible not only to measure all the food and excreta, but also the materials given off from the lungs in the breath, and to make accurate determination of the matter entering and leaving the body. A still more elaborate apparatus, by which not only all the matter passing in and out of the body may be measured, but also all the heat given off from it, is called a respiration calorimeter—that is, a machine for measuring both the respiratory products and the heat given off by the body. It is like the respiration apparatus, except that it is furnished with devices for measuring temperatures. Several have been built, the majority in Europe, within the last twenty years, among the most successful being those by Professor Rubner and Professor Rosenthal, in Germany, and that devised by Professors Atwater and Rosa in the United States. The latter form, which represents a great advance on any previously devised, was elaborated at Wesleyan University in connection with the nutrition investigations carried on under the auspices of the Office of Experiment Stations of the United States Department of Agriculture. Its main feature is a copper-walled chamber, seven feet long, four feet wide, and six feet four inches high. This is fitted with devices for maintaining and measuring a ventilating current of air, for sampling and analyzing this air, for removing and measuring the heat given off within the chamber, and for passing food and other articles. It is furnished with a folding bed, chair, and table, with scales and with appliances for muscular work, and has a telephone connection with the outside. Here the subject stays for a period of from three to twelve days, during which time careful analyses and measurements are made of all material which enters the body in the food, and of that which leaves it in the breath and excreta. Record is kept of the energy given off from the body as heat and muscular work. The difference between the material taken into and that given off from the body is called the balance of matter, and shows whether the body is gaining or losing material. The difference between the energy of the food taken and that of the excreta and the energy given off from the body as heat and muscular work is the balance of energy, and if correctly estimated should equal the energy of the body material gained or lost. With such apparatus it is possible to learn much of the real nutritive value of foods, and what effect different conditions of nourishment will have on the human body. In one experiment, for instance, the subject might be kept quite at rest, and in another do a certain amount of muscular or mental work, with the same diet as before. Then by comparing the results of the two the use

which the body makes of its food under the different conditions could be determined. Or the diet might be slightly changed in one experiment, and the effect of this on the balance of matter and energy observed. Such methods and apparatus are very costly in time and money, but the results are proportionately more valuable than those from simpler experiments.

DIETARIES AND DIETARY STANDARDS. The information gained from a study of the composition and nutritive value of foods may be turned to practical account by using it in planning diets for different individuals or classes of individuals, or in estimating the true nutritive value of the food actually consumed by families or individuals. By comparing the results of many such

investigations with the results of accurate physiological experimenting it is possible to learn about how much of each of the nutrients of common foods is needed by persons of different occupations and habits of life, and from this to compute standards representing the average requirements for food of such persons. The plan followed in making dietary studies is, briefly, as follows: Exact account is taken of all the food materials (1) on hand at the beginning of the study, (2) procured during the study, and (3) remaining at the end. The difference between the third and the sum of the first and second is taken as representing the amounts used. From the figures thus obtained the amount of the different food materials and the amount of the dif-

* Fats and carbohydrates in sufficient amounts to furnish, together with the protein, the indicated amount of energy.

ferent nutrients furnished by them is calculated. Deducting from this the weights of the nutrients found in the kitchen and table refuse, the amounts actually consumed are obtained. Account is also taken of the meals eaten by different members of the family or groups studied and by visitors, if there are any. From the total food eaten by all the persons during the entire period the amount eaten per man per day may be calculated. In making these calculations due account is taken of the fact that women and children eat less than men performing the same amount of work. The various factors commonly used in the United States in computing the results of dietary studies are as follows:

FACTORS USED IN CALCULATING MEALS CONSUMED IN DIETARY STUDIES.

Man at hard muscular work requires 1.2 the food of a man at moderately active muscular work.

Man with light muscular work and boy 15-16 years old require 0.9 the food of a man at moderately active muscular work.

Man at sedentary occupation, woman at moderately active work, boy 13-14, and girl 15-16 years old require 0.8 the food of a man at moderately active muscular work.

Woman at light work, boy 12, and girl 13-14 years old require 0.7 the food of a man at moderately active muscular work.

Boy 10-11 and girl 10-12 years old require 0.6 the food of a man at moderately active muscular work.

Child 6-9 years old requires 0.5 the food of a man at moderately active muscular work.

Child 2-5 years old requires 0.4 the food of a man at moderately active muscular work.

Child under 2 years old requires 0.3 the food of a man at moderately active muscular work.

These factors are based in part upon experimental data, and in part upon arbitrary assumptions. They are subject to revision when experimental evidence shall warrant more definite conclusions.

The preceding table shows the average results of a large number of dietary studies made in the United States and other countries with persons performing different amounts of muscular work and living under different conditions. Using such factors as those referred to above, the digestible nutrients furnished by the diet have also been calculated.

As will be seen, the American dietary standards express the food requirements in terms of protein and energy only. This is done because of simplicity, and is permissible, since, theoretically at least, the proportion of fats and carbohydrates is immaterial, provided both are present and in such quantity that the total energy supplied is sufficient. As the habits and conditions of individuals differ, so, too, their needs for nourishment differ, and their food should be adapted to their particular requirements. Climate and other circumstances influence the character of the food consumed, and doubtless in large degree the quantity also. However, the amount of nutrients is determined, generally speaking, by the age, size of the body, and especially by the amount of work performed, increasing or decreasing according as the amount of work is greater or less. It is not necessary that the food each day equal exactly the amount called for by the dietary standards. A deficiency one day is made good by an excess the next, and *vice versa*. It is believed, however, that persons are best nourished when through long periods the diet furnishes approximately the nutrients and energy which the standard calls for. What has been said applies to persons in health and under more or less normal conditions; the diet of the

sick, convalescent, etc., is a subject which pertains to the practice of medicine.

To learn whether any given diet conforms to the standard, the amount of nutrients and energy (or, what serves the same purpose, protein and energy) must be ascertained. To this end the weight of the different food materials provided for the day's diet must be ascertained, as well as the composition of each of the food materials. This may be readily calculated from the tables of percentage composition. The total protein and total energy is, of course, learned by adding together the amounts furnished by the different food materials. The amount per man per day can then be learned by dividing the total amounts by the number of persons served. If the diet be deficient in protein or in energy, food materials should be added which supply protein or are especially valuable as sources of energy (i.e. foods rich in fats and carbohydrates). If more protein or energy be provided than the standard demands, the food materials should be correspondingly diminished. In ordinary mixed diet, which seems to be the one best suited to man in health, the chief sources of protein are meat, fish, and milk, among animal foods, and the cereals and legumes among vegetable foods. Beans, peas, and oatmeal are rich in protein, and hence are especially valuable food. About nine-tenths of the fat in the ordinary diet is obtained from the animal foods, while the vegetable foods furnish approximately nine-tenths of the carbohydrates.

Too much food is as bad as too little, and occasions a waste of energy and strength in the body, as well as a waste of nutritive material.

Among people who have the benefits of modern comfort and culture the palate revolts against a very simple and unvaried diet, and for this reason the nutrients are usually supplied from a variety of articles—some of animal, some of vegetable origin. With a varied diet it is also easier to secure the proper proportions of protein to fats and carbohydrates.

PREPARATION OF FOOD—COOKING. The cooking of food has much to do with its nutritive value. Many articles which, owing to their physical condition or other cause, are quite unfit for nourishment when raw are very nutritious when cooked. It is also a matter of common experience that a well-cooked food is wholesome and appetizing, while the same material badly cooked is unpalatable. There are three chief purposes of cooking. The first is to change the physical condition so that the digestive juices can act upon the food more freely. Heating often changes the structure of food substances very materially, so that they are more easily chewed and more easily and thoroughly digested. The second is to make food more appetizing by improving the appearance, the flavor, or both. Food which is attractive to the taste quickens the flow of saliva and other digestive juices, and thus digestion is aided. The third is to kill by heat any disease germs, parasites, or other dangerous organisms food may contain. This is often a very important matter, and applies to both animal and vegetable foods. The cooking of meats not only develops the pleasing taste and odor of extractives and that due to the browned fat and tissues, but it softens and loosens the protein (gelatinoids) of the connective tissues, and thus makes the meat more tender. Extreme heat, however, tends to coagulate and harden the albu-

minoids of the lean portions, and also weakens the flavor of extractives. If the heating is carried too far, a burned or charred product of bad flavor results. Meats lose weight in cooking. A small part of this is due to escape of meat juices and fat, but the chief part of the material lost is simply water. The nutritive value of a meat soup depends upon the substances which are dissolved out of the meat, bones, and gristle by the water. In ordinary meat broth these consist almost wholly of extractives and salts, which are very agreeable and often most useful as stimulants, but have little or no value as actual nutriment, since they neither build tissue nor yield energy. The principles which underlie the cooking of fish are essentially the same as with meats. See FISH AS FOOD.

In many vegetables the valuable carbohydrates, chiefly microscopic starch-grains, are contained in tiny cells with comparatively thick walls on which the digestive juices have little effect. The heat of cooking, especially with water, ruptures these walls and also makes the starch more soluble; without water it may also caramelize a portion of the carbohydrates and produce agreeable flavors in this and other ways.

In breads, cakes, pastry, and other foods prepared from flour, the aim is to make a palatable and lighter porous substance, more easily broken up in the alimentary canal than the raw materials could be. Sometimes this is accomplished simply by means of water and heat. The heat changes part of the water in the dough into steam, which, in trying to escape, forces the particles of dough apart. The protein (gluten) of the flour stiffens about the tiny bubbles thus formed, and the mass remains porous even after the steam has escaped. More often, however, other things are used to 'raise' the dough—such as yeast and baking-powder. The baking-powder gives off the gas carbon dioxide, and the yeast causes fermentation in the dough by which carbon dioxide is produced. This acts as the steam does, only much more powerfully. When beaten eggs are used, the albumen incloses air in bubbles, which expand, and the walls stiffen with the heat, and thus render the food porous.

PECUNIARY ECONOMY OF FOOD. Although the cost of food is the principal item in the living expenses of a large majority of the people, and although the physical welfare of all is so intimately connected with and dependent upon diet, very few of even the most intelligent have any ideas regarding the actual nutriment in the different food materials they use. In too many cases even those who wish and try to economize know very little as to the combinations which are best fitted for their nourishment, and have still less information as to the relation between the real nutritive value of different foods and their cost.

There are various ways of comparing food materials with respect to the relative cheapness or dearness of their nutritive ingredients. For instance, from the proportions of available nutrients and energy in different food materials given in Table III. we may calculate the cost of the different nutrients per pound, and of energy per 1000 calories in any given material for which the price per pound is known. Thus, for the different food materials given in Table V., when the price of any material is that given in the first column, the cost of protein and energy will

be as given in the second and third columns. These figures show the relative economy of the various foods as sources of protein and sources of energy. Of course the amount of energy that would be obtained in a quantity of any given material sufficient to furnish a pound of protein would vary with the amounts of fats and carbohydrates accompanying the protein; and on the other hand, the quantities of the different materials that would furnish 1000 calories of energy would contain different amounts of protein. The figures for cost of protein leave the carbohydrates and fats out of account, and those for energy take no account of the protein. Hence the figures for either protein or energy alone give a very one-sided view of the relation between nutritive value and money cost. A better way of estimating the relative pecuniary economy of different food materials is found in a comparison of the quantities of both nutrients and energy which can be obtained for a given sum, say ten cents, at current prices. This also is illustrated in Table V., which follows.

While in the case of certain foods as purchased, notably meats, some waste is unavoidable, the pecuniary loss can be diminished, both by buying those kinds in which there is the least waste, and by utilizing, more carefully than is ordinarily done, portions of what is usually classed as refuse. Much of the waste may be avoided by careful planning so as to provide a comfortable and appetizing meal in sufficient amount, but without excess. If strict economy is necessary, the dearer cuts of meat and the more expensive fruits and vegetables should be avoided. With reasonable care in cooking and serving, a pleasing and varied diet can be furnished at moderate cost. It should not be forgotten that the real cheapness or dearness of a food material depends not only on its market price, but also on the cost of its digestible nutrients. It should always be remembered that "the ideal diet is that combination of foods which, while imposing the least burden on the body, supplies it with exactly sufficient material to meet its wants," and that any disregard of such a standard must inevitably prevent the best development of our powers.

HYGIENIC CONSIDERATIONS. Scrupulous neatness should always be observed in keeping, handling, and serving food. If ever cleanliness is desirable, it must be in the things we eat, and every care should be taken to insure it for the sake of health as well as of decency. Cleanliness in this connection means, not only absence of visible dirt, from worms and other parasites, but freedom also from undesirable bacteria and other minute organisms. If food, raw or cooked, be kept in dirty places, peddled from dirty carts, prepared in dirty rooms and in dirty dishes, or exposed to foul air, disease germs and other offensive and dangerous substances can easily get in. Food and drink may, in fact, be very dangerous purveyors of disease. Experiments have clearly shown that fruits, vegetables, and other foods may readily acquire undesirable or dangerous bacteria if exposed to street dust. The bacteria of typhoid fever sometimes find their way into drinking-water; those of typhoid and scarlet fevers and diphtheria into milk. Thus sickness and death are brought to large numbers of people. Oysters which are taken from the salt water where they grow, and 'floated' for a short time in brackish water near the mouth of a

TABLE V.—COMPARATIVE COST OF DIGESTIBLE NUTRIENTS AND ENERGY IN DIFFERENT FOOD MATERIALS AT AVERAGE PRICES

[It is estimated that a man at light to moderate muscular work requires about 0.23 pound of protein and 3060 calories of energy per day]

* The cost of one pound of protein means the cost of enough of the given material to furnish one pound of protein, without regard to the amounts of the other nutrients present. Likewise the cost of energy means the cost of enough material to furnish 1000 calories, without reference to the kinds and proportions of nutrients in which the energy is supplied. These estimates of the cost of protein and energy are thus incorrect in that neither gives credit for the value of the other.

stream, have been known to be affected by typhoid-fever germs brought into the stream by the sewage from houses where the dejections from patients had been thrown into the drains. Celery or lettuce has been thought to convey typhoid fever from having grown in soil containing typhoid germs.

Food materials may also contain parasites, like tapeworms in beef, pork, and mutton, and trichinæ in pork, which are often injurious and sometimes deadly in their effect. This danger is not confined to animal foods. Vegetables and fruits may be contaminated with eggs of nu-

merous parasites from fertilizers used in growing them. Raw fruit and vegetables should always be very thoroughly washed before serving if there is any doubt as to their cleanliness. If the food is sufficiently heated in cooking, all organisms are killed. Sometimes food undergoes decomposition in which injurious chemical compounds, so-called ptomaines, are formed. Poisoning by cheese, ice-cream, preserved fish, canned meats, and the like has been caused in this way. The ptomaines often withstand the heat of cooking. In some cases it has been found that foods are adulterated with compounds injurious to health; but

sophistication in which harmless articles of inferior cost or quality are added is more common.

Dainty ways of serving food have a usefulness beyond their æsthetic value. Every one knows that a feeble appetite is often tempted by a tastefully garnished dish, when the same material carelessly served would seem quite unpalatable. Furthermore, many cheap articles and 'left-overs,' when well seasoned and attractively served, may be just as appetizing as dearer ones, and will usually be found quite as nutritious.

See articles on various materials used as food. See also **INFANTS, FEEDING OF**.

FOOD OF PLANTS. Carbonic acid and water are often spoken of as the food of green plants, but this is somewhat misleading; these substances are not themselves foods, but serve as material from which foods are made by the green cells of plants when sufficiently illuminated. (See **PHOTOSYNTHESIS**.) Various inorganic salts are sometimes reckoned among the foods. The rôle of these, however, is obscure at present, though some of the elements obtained from them, namely, potassium, magnesium, iron, and calcium, seem to be indispensable to the proper development and functions of the plant, and perhaps they are built into the protoplasm. At any rate the functions are profoundly altered when one element is replaced even by a similar element; e.g. potassium by sodium. Oxygen, too, has been included in the foods. But its relation to protoplasm in the process of respiration is uncertain, and for the present it is preferable to treat respiration and nutrition (q.v.) as distinct.

Excluding the substances mentioned, plant foods are complex carbon compounds, which belong mainly to four groups: carbohydrates, proteids, amides, and fats. They contain two or more of the elements carbon, hydrogen, oxygen, nitrogen, sulphur, and phosphorus, combined in the most various proportions. The value of a food, however, does not depend on chemical composition alone, but is profoundly influenced by its

constitution; i.e. the nature and arrangement of the atomic groups that make up its molecules. Apparently carbon is assimilable only when its atoms in the food molecules are directly combined with atoms of hydrogen. The introduction of a hydroxyl group (OH) seems to improve assimilability: thus glycerin, $\text{CH}_2\text{OH}.\text{CHOH}.\text{CH}_2\text{OH}$ is better than propyl alcohol, $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$. The aldehyde group (CHO), too, is characteristic of many foods. Very little, however, is known of the chemical constitution of most foods. See **RESPIRATION IN PLANTS**; **ABSORPTION, IN PLANTS**; **STORAGE**; **GROWTH**.

FOOD, PRESERVATION OF. Bacterial growth and action is the cause of the decay of all food products, as it is of organic matter in general. Hence all processes for preserving food from decay have the same object in view—the prevention of the growth of these micro-organisms. These processes may be grouped in three general divisions: (1) The various methods which subject food to some process of treatment designed to prevent the growth of bacteria; (2) the canning process, which first, by the application of heat, kills all the bacteria in the food, and then, by hermetically sealing the sterilized food, prevents the access of more bacteria; (3) the use of cold, to keep the food at a temperature below that at which those micro-organisms can develop. It is an interesting fact that all these processes for preserving food, except the use of a few of the antiseptics, were successfully practiced long before the relation of micro-organisms to fermentation and putrefaction was even suspected, and that industries founded upon them were thriving while the scientists were still disputing whether putrefaction could be avoided by preventing the access of bacteria. See **BACTERIA**.

The first group of preserving methods embraces all the processes used in ancient times for keeping food except that of freezing, and also includes the modern use of antiseptics as such. It therefore includes desiccation, curing, pickling, and 'preserving,' in the more limited sense in which this term is used by housewives. *Desiccation* is probably the oldest, as it is the simplest method of preserving fruits, vegetables, and even meats from decay. As organic life requires moisture, the thorough drying of the food checks its growth. This was first done in the sun or by the fire. During the nineteenth century, however, more scientific principles were applied, and the preparation of prunes, raisins, and other dried fruits for the market has become an important industry in Spain, Italy, and, more recently, in southern California.

The first patented process for the modern method of drying fruits and vegetables by evaporation was introduced by Chollet of Paris in 1852, and patented in England in 1854. It was chiefly applied to vegetables and a few kinds of fruit, such as apples and pears, which have a small amount of juice. By this method Chollet entirely removed all moisture from the vegetables by drying either in a vacuum or by the aid of heated air, which reduces their bulk more than one-half. They are then compressed under powerful presses, which, besides rendering them extremely portable, also makes them less liable to absorb moisture from the atmosphere, which is very desirable, as they are very absorbent. In this way both the color and distinctive flavor of

the vegetables are completely preserved, and mere soaking in water restores them almost precisely to their original condition. See RAISINS; PRUNES.

In the case of large pieces of meat, like hams, the mere process of drying is supplemented by the use of salt and by smoking over a wood fire, the chief preservative element in the smoke being creosote. This general process of preserving meat, subject to endless variations, is known as *curing*. This method has long been known to Oriental as well as Western nations, and it is still a very popular method of preserving meat. In the United States the large packing houses smoke immense quantities of meat with hickory wood. One establishment in Chicago has 43 smoke-houses, each of which holds 600,000 pounds of ham, or 120,000 pounds of side meat, besides 11 houses of half that capacity. (See HAM.) Certain fish and meats are cured by simply packing in salt or in a strong brine, salt being an excellent antiseptic or germ-killer.

PRESERVING AND PICKLING are the processes by which food, usually fruits, is preserved by the use of sugar, vinegar, or some alcoholic liquor, as brandy, or by a combination of sugar with brandy or vinegar, heat being applied. Fruits intended for confectionery are preserved in four different ways: They may be preserved in the form of jam, in which the fruit is simply boiled with from one-half to equal its weight of sugar. By this method the fruit becomes broken, and the juice set free; but all is preserved, as the latter forms a thick syrup with sugar. Such preserves can be kept, if well made, for several years, but are best used during the first winter. A second plan is to preserve only the juice, which, when carefully strained from the solid portions of the fruit, and boiled with a third or half its weight of refined sugar, constitutes the fruit jellies of the cooks and confectioners. Another method is called *candying*, and consists in taking fruits whole or in pieces, and boiling them in a clear syrup previously prepared. In this way they absorb the syrup, and are then dried by a gentle heat, which causes the sugar of the syrup to crystallize on the surface and through the substance of the preserved fruits, which retain their form, and much if not all of their color. The remaining method is to stew them carefully in a weak syrup of refined sugar and water, so that they are rendered soft but are not broken. They are then transferred, with the syrup, to jars with well-prepared covers, to prevent evaporation; and pale brandy, equal in quantity to the syrup, is added. As a rule only stone-fruits, such as peaches, plums, and cherries, are preserved in this way. Several fruits and vegetables, such as olives, cucumbers, cabbage, etc., are preserved for food in a saturated solution of salt and water poured in hot; others, in vinegar.

FOOD PRESERVATIVES. The use of antiseptics for the preservation of food is a recent and rapidly growing practice which is liable to great abuse, and against which it is believed that strict sanitary regulations should be enforced. The scientific side of the subject has been discussed under ANTISEPTIC.

Of the 67 samples of commercial food preservatives examined by W. D. Bigelow, of the Division of Chemistry in the United States Department of Agriculture, 33 contained borax or boric acid; 10 sodium, potassium, or calcium sulphite; 8 sal-

icylic acid or its sodium compound; 1 boric acid and salicylic acid; 1 boric acid and ammonium fluoride; 3 formaldehyde; 7 common ammonium fluoride; 2 pyroligneous acid; and 1 beta-naphthol. Certain of these substances are undoubtedly injurious, such as formaldehyde, salicylic acid, and sulphites, and in the case of others, like borax and benzoic acid, the toxic action is disputed. Passing on to the consideration of the effect of each of these different drugs on the system, it is shown that a pound of meat treated according to directions with *borax* would contain four or five more grains than a physician's dose, and that an infant who is fed a quart of milk each day so treated will receive eight grains, a fair-sized dose for an adult.

The use of *sulphites* is less common in food preservatives, but far more dangerous. In the preparation of casks for storing wine it has long been customary to treat them with a small amount of burning sulphur. The sulphurous acid so formed assists in sterilizing the casks and preventing the after-fermentation of the wine. In all wine-producing countries except America the amount of sulphurous acid so employed is limited by law to one or two parts in 10,000 parts of wine. Free sulphurous acid and sulphites are permitted in European wines in only one-tenth the amount given above. The compound is recognized as distinctly toxic, and a larger proportion than that mentioned is universally recognized as injurious. The sale of beer containing sulphurous acid or sulphite is specifically prohibited in almost all civilized countries. By following the directions of dealers in food preservatives we would add one to four ounces or its equivalent of this substance to 100 pounds of meat, or the same amount to from 35 to 50 gallons of cider, beer, or other liquid. *Salicylic acid* (q.v.) is chiefly used in the United States to preserve fruit and vegetable products. Many European countries prohibit its use as a food preservative altogether, and its use is condemned by the result of all recent physiological studies. It is possible that the majority of persons in sound health may suffer no evident injury from its use in small amounts, but its use by aged and infirm persons is attended with great danger. The use of *benzoic acid* as a food preservative is widespread and rapidly increasing, having been substituted by many manufacturers for the more harmful salicylic acid. Mr. Bigelow concludes that there are doubts as to the wholesomeness of this compound, and contends that food containing it should always be so labeled. *Formaldehyde* has been used as a preservative since 1895, and is most commonly employed for the preservation of milk. Its use is undoubtedly objectionable, and should be prohibited. Not only does it interfere with digestion to a marked extent, but it has been definitely proved that a compound is formed with the casein of milk, which causes the latter, when treated with dilute acid, such as exists in the gastric juice, to separate in hard lumps that are attacked with difficulty by the digestive ferments. Aside from the actual danger of its use, there is always the likelihood that its action will be depended upon to keep milk sweet, to the neglect of the cleanliness which should characterize the handling of this most easily contaminated food material. The *fluorides* and *beta-naphthol* are condemned unqualifiedly, there being no doubt of their toxic properties. Various attempts have been made

to use *pyroligneous acid* for the curing of meats in place of the more tedious process of smoking. The trade name for this compound is 'liquid smoke.' Its effects, from a hygienic standpoint, have not been ascertained, but it is certain that meat treated with a bath in *pyroligneous acid* should not be sold as smoked meat.

An attempt has been made to prevent meat from putrefying by introducing an antiseptic liquid into the circulation of the animal before being killed. The bullock is first stunned by a blow, the jugular vein is then opened, and a small quantity of blood drawn. A tube is afterwards inserted, through which the antiseptic mixture is forced into the circulation, and after a few minutes the animal is killed. Meat treated in this way keeps fresh for several weeks.

CANNING. The process of hermetically sealing food to preserve it for future use was discovered in 1795 by a Frenchman named Nicholas Appert. Fourteen years later Napoleon gave him a prize of 12,000 francs for his invention. He continued his researches through life, spending all his money upon them, and, like many other inventors, died alone, in poverty and neglect. In 1810 an English patent was taken out for Appert's process, from which, however, the latter derived no benefit. From England the knowledge of the process was soon brought to America. Lobsters and salmon were the first goods canned in America, but by 1825 fruits and vegetables were also canned. In 1849 a factory was established at Newark, N. J., where fruits and vegetables were canned for Dr. Kane's Arctic expedition. The discovery of gold in California the same year gave a great impetus to the canning industry.

During the Civil War canned condensed milk, the process of making which had been patented by Gail Borden in 1856, was in great demand.

Glass jars were at first used, but their use was soon abandoned on account of their perishability, bulkiness, and expensiveness, and in 1823 Thomas Kensett secured a patent on the use of tin cans for this purpose, and this material has since been universally employed. At first the cans were cut out with shears, beaten together over a former, and soldered by hand. The cans were crude, and their manufacture very expensive. In 1847 Allen Taylor invented the stamp can, and two years later Henry Evans invented a press for stamping out can-tops. The key-opening can, which was perfected by Zimmerman, is a much more recent invention.

By the Appert process the goods were cooked in open kettles, in which, of course, the highest obtainable temperature was 212 degrees. By adding chloride of calcium to the water the temperature could be raised to 240 degrees. About 1874 John Fisher invented a patent process kettle in which the goods are heated to any desired temperature with dry steam; at about the same time A. K. Shriver invented a closed-process kettle in which the goods are cooked by superheating water with steam. Both of these methods are now in use. In the modern canning factory the goods are immediately sorted and placed in the cans, and the caps soldered on. In each cap there is a hole for the escape of gas and steam during the cooking process. The cans are then placed in a steel boiler, the cover of which is bolted down, and steam turned in, which sterilizes the contents by heating to the proper temperature under pressure. They are then hermetically sealed by

placing a drop of solder on each vent-hole, and are ready for shipment. Not only raw foods, but a large variety of made dishes, as soups, sauces, and jams, are put up in this way.

The canning of fish requires greater care than that of fruit and vegetables because fish decay so much more rapidly. It is said that long before the Appert process was invented the people of Holland had learned the art of canning salmon, so as to arrest putrefaction. The fish were boiled in a salt brine, then smoked, and then sealed in tin cans liberally supplied with butter. The salmon canneries of the Pacific are usually located on the water's edge. The fish immediately upon receipt are subjected to an ice-cold bath, and after being dressed are again washed. They are cut up by machinery into pieces the length of the can, and are then subjected to such intense heat that not only the fish but the bones are cooked so that they will crumble. The cans are tightly soldered for the first cooking. They are then tested by the process known as 'blowing' or 'venting,' which consists in making a small perforation in each can to permit the escape of steam. The can is then placed in another steam-heated retort for the final cooking, after which it is given a lye bath to remove grease. After cooling the cans are lacquered and labeled, ready for market.

The canning of oysters has been encouraged by various improvements. At first the oyster-shells were opened by hand. In 1858 Louis McMurray began scalding the oysters before they were shelled, a treatment which greatly facilitated the latter operation. In 1862 steam was used instead of hot water. This was at the suggestion of Henry Evans, who devised a steam-chest holding about twenty bushels of oysters. A door is at each end of the air-tight chest and through it runs a track on which the carload of oysters is pushed in. After steaming fifteen minutes the oysters are easily shelled with a knife by skilled operatives. They are then canned in the usual manner.

The objection has been urged against the use of tin cans that the natural acids of fruits, vegetables, and meats act upon the tin and solder in such a way as to form metallic salts or metallic compounds that are injurious to health. According to a statement in a section on the canning and preserving of foods in the United States Census for 1900, the matter has been carefully investigated by expert chemists, who have reported that if good tin is used the objection is groundless. In the poorer grades of tin injurious substances were found, but in such small quantities that they were of no consequence.

STATISTICS OF THE CANNING INDUSTRY. According to the census report just mentioned, 2195 establishments in the United States were engaged in 1900 in the canning of fruits and vegetables, fish and oysters. The total capital invested in this industry was given as \$48,497,978, and the annual value of the products as \$82,592,196. The industry is divided into three distinct branches, the canning of fruits and vegetables being handled by one group of establishments, the canning of fish by another, and the canning of oysters by another. Of the 2195 canning factories, 1808 belong to the first-named class, 348 to the second, and only 39 are reported as engaged in canning oysters. The canning of fruits and vegetables is well distributed over the country, but the largest

number in any one State, 136, is in California. In canning fish Maine leads with 117 establishments and Alaska comes next with 36. The most important branch of the industry is the salmon-canning of the Pacific Coast, next to which comes the sardine-canning of Maine. Oysters are canned on the shores of the Chesapeake and of the Gulf of Mexico. Considering the growth of the industry as a whole, we find that fruit and vegetable canning factories have increased from 97 in 1870 to 1808 in 1900; fish-canning factories have increased from 110 in 1890 to 348 in 1900. The value of canned goods imported into the United States in 1900 was \$8,023,763, and of exports for the same year, \$19,557,857.

COLD STORAGE. The use of artificial cold for the preservation of perishable foods, either in storage or transit, was introduced during the last quarter of the nineteenth century, and has effected a complete revolution in the method of handling food, particularly meat. The method by which the temperature is lowered for cold storage is described under **REFRIGERATION**. Some of the practical results of cold storage are discussed under **PACKING INDUSTRY**.

BIBLIOGRAPHY. For descriptive and statistical matter regarding the canning industry, consult Hunt, "Canning and Preserving," in *Twelfth United States Census*, Manufactures, vol. ix., part iii. (Washington, 1902); for discussions on "The Use and Abuse of Food Preservatives" and on "The Influence of Refrigeration on the Fruit Industry," consult the *Year Book of the Department of Agriculture* for 1900 (Washington, 1901).

FOOL. See **COURT FOOL**.

FOOL OF QUALITY, THE. A quasi-historical religious novel, by Henry Brooke (1760-70). It was revised and republished by Wesley during the author's lifetime without the author's consent, under the title of *The History of Harry, Earl of Moreland*, and was again republished in 1859 by Charles Kingsley with a biographical memoir. The story was suggested by a tale told the author by his uncle during a horseback journey, and was one of the most remarkable books of its time.

FOOLS, FEAST OF. See **FEAST OF FOOLS**.

FOOL'S ERRAND, A. A novel of the South in the Reconstruction period, by Albion W. Tourgée (1879). The career of the hero, Comfort Servosse, shows vividly the difficulties of Northerners living in the South at that time.

FOOL'S PARADISE (Lat. *limbus fatuorum*). That division of *limbus* (q.v.) in which the souls of fools, idiots, and lunatics, who are not responsible for their sins, nor yet deserving of heaven, await the Resurrection. As commonly used, the expression denotes a state of insecure joys, false hopes, and sometimes of unlawful love.

FOOL'S PARSLEY. An umbelliferous weed, very common in gardens and fields of Europe, and introduced into the United States from New England to Minnesota. The only species, *Ethusa cynapium*, is a poisonous plant with properties similar to those of the hemlock, and resembles parsley in its manner of growth and foliage. It is frequently mistaken for parsley, and is the cause of serious accidents.

FOOL'S REVENGE, THE. A tragedy by Tom

Taylor, produced at the Queen's Theatre, London, in 1869. It was taken bodily from Hugo's *Le roi s'amuse*.

FOOT. See **WEIGHTS AND MEASURES**.

FOOT (AS. *fōt*, Icel. *fōtr*, Goth. *fōtus*, OHG. *fuoz*, Ger. *Fuss*, foot; connected with Lat. *pes*, Gk. *pois*, *pous*, Lith. *padas*, Av. *pāda*, Skt. *pada*, foot). In music, a unit of measure used in determining the pitch of organ-stops. The Germans have always used the word *pusston* in representing the pitch of the different stops of an organ, such as *Principal* sixteen-foot, eight-foot, or four-foot, etc., a practice which has been universally introduced, and is found very useful to organists. The pitch of the stop is fixed according to the length of the lowest C pipe. Thus an eight-foot stop is one whose longest pipe produces the tone C; a four-foot stop is an octave stop; and a sixteen-foot stop gives tones an octave lower than the notes indicated by the keys used. See **ORGAN**.

FOOT (in verse). See **VERSIFICATION**.

FOOT. In describing the structure of the foot, it is expedient to commence with a brief notice of the bones which occur in it. In man these are 26 in number, and are arranged in three natural groups—viz., the tarsal bones, corresponding to the carpal bones of the hand, which are the hindermost; the metatarsal bones, which occupy the middle portion; and the phalanges of the toes anteriorly. The tarsal bones, seven in number, are short and thick, and form the heel and the hinder part of the instep. The uppermost is called the *astragalus*, from its supposed resemblance to the dice used by the Romans. Above it is articulated or jointed with the two bones of the leg, the *tibia* and *fibula*, and through these bones the whole weight of the body is thrown upon the two *astragali*. Behind, it is connected with and rests upon the *os calcis*, or heel-bone, which is the largest bone of the foot. Immediately in front of it, and supporting it in this direction, is the *scaphoid* or boat-like bone. In front of the scaphoid bone are the three *cuneiform* or wedge bones; and on the outer side of the cuneiform bones, and in front of the *os calcis*, is the *cuboid* bone. The front row of tarsal bones is composed of the three cuneiform bones on the inner side of the foot, and of the cuboid bone externally. There are five metatarsal bones passing forward, one for each toe. Each cuneiform bone is connected with one, and the cuboid bone with two, of these metatarsal bones. Behind, they are close together, but as they run forward they diverge slightly from one another, and their anterior ends rest upon the ground, and form the *balls* of the toes. They constitute the fore part of the instep. The remaining bones are those of the toes, and are named the *phalanges*, each toe having three of these bones, excepting the great toe, which has only two.

The instep is composed of the seven tarsal and the five metatarsal bones, which are so arranged and connected as to form an arch from the extremity of the heel-bone to the balls of the toes. This is called the *plantar arch*, from *planta*, the sole of the foot. The *astragalus* forms the summit or keystone of this arch, and transmits the weight which it receives posteriorly to the heel, and anteriorly to the balls of the toes. The arrangement of the fibres and laminae in the interior of the bones is such that the greater num-

ber of them in each bone follow the directions of the two pillars of the arch, and thus give the greatest strength to the bones in the directions in which it is most required. There is also an arch from side to side in the foot, springing from the cuboid on the outside to the inner cuneiform on the inside. See FOOT, COMPARATIVE ANATOMY OF.

DORSAL SURFACE OF LEFT FOOT.

The bones, where they articulate with one another, are covered with a tolerably thick layer of highly elastic cartilage, and by this means, together with the very slight movements of which each bone is capable, a degree of elasticity is given to the foot, and consequently to the step, which would be altogether wanting if the plantar arch were composed of one single mass of bone. This elasticity is far greater in the anterior pillar of the arch, which is composed of five comparatively long bones sloping gradually to the ground, than in the posterior pillar, which is short, narrow, and composed of a single bone, which descends almost vertically from the ankle to the ground. Hence, in jumping from a height we always endeavor to alight upon the balls of the toes and thus break the shock which we should feel if, by accident, we descended upon the heels.

The ligaments which unite these bones to one another, and by which the movements of each bone upon the others are limited, are very numerous. We shall merely notice two of these ligaments, selecting those whose action is especially obvious in maintaining the shape of the plantar arch. One, the *plantar*, or *long calcaneo-cuboid ligament*, of great strength, passes from the under surface of the *os calcis*, near its extremity, forward to the bases of the second, third, and fourth metatarsal bones. It extends between the lowest points of the two pillars of the arch, holding them in their places, and pre-

venting their being thrust asunder when pressure is made upon the key-bone. It converts the groove on the under surface of the cuboid bone into a canal for the passage of the tendon of the *peroneus longus* muscle. Another very strong ligament passes from the under and fore part of the *os calcis* to the outer side of the scaphoid bone. This is the *superior calcaneo-scaphoid ligament*. The *interosseus*, or *internal calcaneo-cuboid ligament*, directly connects the *os calcis* and the cuboid bones. It is blended at its origin with the *superior calcaneo-scaphoid ligament*; and by separating in front they present such an appearance as to be called the Y ligament. The Y ligament underlies and supports the round head of the astragalus, and has to bear a great deal of the weight which is transmitted to that bone from the leg. It possesses a quality which the ligament just described, and most ligaments, have not—viz., elasticity. This is very important, for it allows the head of the key-bone to descend a little when pressure is made upon it, and forces it up again when the pressure is removed, and so gives very material assistance to the other provisions for preventing jars, and for giving ease and elasticity to the step.

The spot over which this ligament extends is the weakest in the foot, the astragalus being there unsupported by any bones; additional support is, however, afforded when it is most required by the tendon of a strong muscle, the *posterior tibial*, which passes from the back of the tibia (the chief bone of the leg) round the inner ankle, to be inserted into the lower part of the inner surface of the scaphoid bone. It not infrequently happens that the astragalus, from either being insufficiently supported or being overweighted, descends slightly below its proper level, causing a lowering of the arch and a flattening of the sole of the foot. The defect, when slight, is known as 'weak ankle;' when more decided it is termed 'flat-foot;' and in extreme cases the bone may descend to such an extent as even to render the inner side of the foot convex when it naturally should be concave. There are two periods of life at which *flat-foot* is especially liable to occur: (1) In infancy, if the child be put upon its feet before the bones and ligaments—especially the latter—are strong enough to bear its weight; and (2) about the age of 14—a period at which growth is very quick, and the body consequently attains a considerable and rapid augmentation of weight.

We now come to the movements of the foot upon the leg. We see here a striking combination of variety of movement with general security. This combination is effected by the harmonious action of three joints, each of which acts in a direction different from the others. The first of these joints is the ankle-joint, which is formed by the bones of the leg—the tibia and fibula—above and the astragalus below. By this joint the foot is bent or straightened on the leg. The second joint is between the astragalus and the heel-bone, and it permits the foot to be rolled inward or outward; while the third joint is between the first and second row of tarsal bones—namely, between the astragalus and heel-bone behind, and the scaphoid and cuboid bones in front—and allows the degree of curvature of the plantar arch to be increased or diminished within certain limits. The following is the order in which the movements of these three joints oc-

cur: the raising of the *heel* (by the first joint) is accompanied by a rolling of the foot inward (by the second joint), and by an increased *flexure* of the plantar arch (by the third joint); and the raising of the *toes* is accompanied by a rolling of the foot outward and a *straightening* of the sole.

The joints, however, merely allow of movements—they do not effect them; this is the special function of the muscles, and each of the three movements we have indicated is effected by special groups of muscles. The first series of movements is mainly effected by three muscles,

EFFECT OF MUSCULAR ACTION IN THROWING UP THE ARCH.

viz.: (1) the muscles of the calf, attached above to the bones of the thigh and leg, and below by the *tendo Achillis* to the heel-bone; (2) the posterior *tibial*, attached above to the tibia, and below by its tendon to the scaphoid bone; and (3) the *peroneus brevis*, attached above to the fibula, and below by its tendon to the outer metatarsal bone. The calf-muscles, whose tendon is inserted into the heel-bone, are large and very powerful, for in raising the heel they have to raise the weight of the body. The other two muscles, the posterior *tibial* and the short *peroneal*, turn round the inner and outer ankle respectively, and are inserted into the inner and the outer edges of the instep—the former being attached to the scaphoid, and the latter to the outer metatarsal bone. They not only assist to raise the ankle, but support it laterally.

ARCH OF THE FOOT IN ORDINARY STANDING POSITION.

The muscle whose tendon is on the inner side of the foot (the posterior *tibial*) effects the two movements which are associated with the raising of the heel-bone, namely, the turning of the foot inward and the increased flexure of the arch. The second series of movements—the raising of the toes, the turning of the foot outward, and the straightening of the sole—are effected by two muscles, the anterior *tibial* and the third *peroneus*, whose tendons pass, one in front of the inner ankle, and the other in front of the outer ankle, to the corresponding edges of the instep, and are inserted into the internal cuneiform and the outer metatarsal bones. The muscles are direct flexors of the tarsus upon the leg, the former raising the inner and the latter the outer border of the foot.

Another point in the anatomy of the foot that requires notice is the mode of union of the metatarsal with the tarsal bones. In these joints in the fourth and fifth toes a slight revolving motion can take place, which probably enables the outer metatarsals to adapt themselves to inequalities of the ground, and to equalize

the distribution of the weight which is thrown upon the foot; while in the corresponding joints of the three inner toes scarcely any motion can occur—a provision by which additional strength is given to the inner side of the foot, upon which the weight of the body most directly falls.

The skin of the sole is very tough and strong; and intervening between it and the bones and long plantar ligament is a thick pad of fat, which acts the part of an air or water cushion in defending the adjacent parts from injurious pressure, and in deadening the jars and shocks that would otherwise be felt in leaping, etc.

FOOT, COMPARATIVE ANATOMY OF THE. As locomotor appendages, so called, feet occur in echinoderms, mollusks, and arthropods among vertebrates, but they are not in any way homologous with the feet of the higher vertebrates. Among echinoderms the name 'foot' is given to any appendage of the ambulacral system which terminates in a sucker, and in the case of starfishes it is extended to any of the appendages lying in the ambulacral groove. These echinoderm feet are often, but by no means always, used for locomotion. Mollusks possess a very muscular and usually largely developed organ, primarily concerned with locomotion, known as the foot; it is flat or concave in the chitons and gastropods, and covers the ventral side of the body; in lamellibranchs it is also ventral in position, but is wedge-shaped and laterally compressed; in cephalopods it is anterior in position, surrounding the mouth, and is divided up into a siphon, placed posteriorly, and a number of outgrowths known as tentacles or arms. Among cephalopods the chief function of the arms is for capturing prey, locomotion being provided for in other ways, chiefly by means of the siphon, which is formed by the union of two epipodial folds. The 'feet' of arthropods show a very great variety of form, due chiefly to the variety of functions which they perform. In most cases it is practically impossible to distinguish between leg and foot, the latter consisting merely of the terminal joint or joints of the former. In many insects, however, the terminal part of the leg is so placed, with reference to the other joints, when in use, that it has both the appearance and function of a foot.

AMPHIBIANS AND REPTILES. Passing over the non-homologous fins of fishes, we may first mention the foot of the Urodela, the short-legged amphibians. As in all vertebrates, the feet here are the termination of the hind limbs, and their skeleton consists of two or three parts, according to whether we include the ankle-bones or not. Most distal of all are the phalanges of the digits or toes, then follow the metatarsals, and most proximal are the tarsals. In the Urodela, the feet are supplied with five digits in most cases, but some have only four, and *Proteus* has only two; the digits lack nails or claws; the number of phalanges differs in the various digits as well as in various species. The metatarsals are of the same number as the toes and appear like their proximal joint. The tarsals are a group of nine bones, of which one, the centrale, occupies a middle position; distal to it are five others of approximately uniform size, called tar-

sales; proximal to the centrale are three bones, of which the inner is the tibiale, the outer the fibulare, and the middle one the intermedium. In the Anura (frogs, toads, etc.) the foot is very much larger, and the toes, five with no nails, are broadly webbed; phalanges and metatarsals are greatly elongated, as are also two of the tarsal bones, which are known as the astragalus and the calcaneum; the former is the tibiale, with which the intermedium has fused, while the latter is the fibulare. The Chelonia (turtles, etc.) have five digits, but in the marine forms the toes are more or less firmly united together by the integument, thus forming paddles useful in swimming. Some or all of the digits of Chelonia bear nails or claws. The phalanges and metatarsals are stout and short, except in the marine forms, where they are elongated and flattened. The fifth metatarsal has the appearance of being bent in the middle. The tarsal bones undergo various fusions, so that their number and arrangement differ in different genera. The tibiale and intermedium are generally united into an astragalus, which in some cases includes the centrale also, and in one genus (*Emys*) even the fibulare, thus making a single bone of the whole proximal series. The two outer tarsals are fused to form the cuboid. Lizards usually have five digits, two, three, four, five, with four phalanges respectively, beginning at the inner side; the fifth metatarsal is bent as in the turtles, and is perhaps fused with the fifth tarsale, in which case the ankle-joint would come in part between the two rows of tarsal bones, which is the condition of the ankle in birds. In lizards we find an astragalus and calcaneum proximally and a cuboid distally, with sometimes one or two more of the tarsales. Feet are entirely lacking in snakes, unless the spur on each side of the body near the vent in the boas and pythons be regarded as such. Crocodiles have only four toes, though an examination of the skeleton reveals a rudimentary fifth metatarsal; the four digits have respectively two, three, four, and four phalanges, and only the first three have claws. Only four tarsal bones are present, of which the two distal ones are small, while the two proximal, called astragalus and calcaneum, are large; the latter bears a prominent calcaneal process projecting posteriorly, which forms a heel to the foot—the first occurrence of such a thing in the animal kingdom.

BIRDS. Among birds the feet are so profoundly modified by the various uses to which they are put that we find a very great variety of external form, but the skeletal structure shows considerable uniformity. The number of digits is usually four, not rarely three, and in the ostrich only two; the fifth toe is the one always missing, the first occasionally, and in the ostrich the second also; the phalanges are almost always two, three, four, and five, or rarely, two, three, four, and three, or in swifts, two three, three, and three. The metatarsals are more or less completely fused into a single bone, the upper end of which is fully fused with the distal row of tarsal bones. The proximal tarsal bones are fused with the lower end of the tibia, so that the ankle-joint is actually between the two series of tarsal bones. In the foot of a bird, therefore, what is usually termed the 'heel' is simply the base of the digits; the so-called 'tarsus' (see **BIRD**) is really a tarso-metatarsus, and the

'tibia' is a tibio-tarsus. The foot of a bird is usually free from feathers, and is generally covered with scales, and the digits terminate in straight or more or less hooked claws. In some birds, however, especially among the grouse and the birds of prey, the feet are feathered (at least in front) to the base of the toes, and in ptarmigans even to the claws.

MAMMALS. Among mammals there is perhaps even greater variety in the form and structure of the foot than among birds, but the foot of mammals is usually very similar to the hand, except in the highest forms. In the orders Sirenia and Cetacea there is no foot whatever, and among the aquatic Carnivora (seals, etc.) it is modified to form a sort of flipper of great use in swimming; this is accomplished by the lengthening of the first and fifth digits, the great reduction of the heel, and the greater or less union of the leg with the tail and posterior part of the body. The number of functional digits in mammals varies from one to five, but frequently, where the number is below five, rudimentary digits are present. The digits terminate either in claws, nails, or hoofs, according to the habits of the animal; the number of phalanges is remarkably constant—in the first digit two, and three in each of the remaining four. In the Ungulata the metatarsals are often fused to form a long tubular bone, the 'cannon-bone.' The tarsus of mammals contains from six to eight bones, according to the amount of fusion; the intermedium is distinct only in marsupials, in the Monodelphia being fused with the tibiale to form the astragalus; the fourth and fifth tarsals fuse into a single bone known as the cuboid; the centrale is called the navicular, and the calcaneum is called the pisiform bone; the other tarsals are known as cuneiform bones, and the inner and second one sometimes fuse to form a single bone. Lack of space forbids any discussion of the general appearance of the feet and their special uses in mammals, but it may be remarked that if the whole sole of the foot is applied to the ground the animal is called 'plantigrade,' like man; if only the toes form the supporting portion of the foot, the animal is 'digitigrade'; and if only the distal phalanx serves for support (as in the horse) the creature is 'unguligrade.'

Consult: Wiedersheim, *Comparative Anatomy of Vertebrates* (New York, 1886); Huxley, *Anatomy of Vertebrated Animals* (New York, 1886); Baur, "On the Morphology of the Tarsus in Mammals," in *The American Naturalist*, vol. xix. (Philadelphia, 1883).

FOOT, SOLOMON (1802-66). An American lawyer and legislator. He was born in Cornwall, Vt., graduated at Middlebury College in 1826, and was professor of natural philosophy in the Vermont Academy of Medicine from 1828 to 1831, when he was admitted to the bar. After serving for several terms in the State Legislature, for three years (1836, 1838 and 1847) as speaker of the House, he was one of the Representatives of his State in Congress from 1843 to 1847, and from 1851 until his death was a member of the United States Senate, serving as president *pro tempore* during a part of the Thirty-sixth and the whole of the Thirty-seventh Congress. At first a Whig, he joined the Republican Party at the time of its formation in 1856.

FOOTA-JALLON, fōō'tā'zhā'lōn'. See FUTA-JALLON.

FOOT-AND-MOUTH DISEASE, or **APHTHOUS FEVER**. A virulent infectious disease, characterized clinically by a condition of fever followed by eruptions on the integument especially of the mouth and feet. Since the middle of the eighteenth century outbreaks of an epizootic form have been frequently recorded among cattle, which, like pigs, are especially subject to it. It also occurs in sheep, goats, and other even-toed ungulates. Man is frequently affected. In European countries, where the disease usually prevails and causes great losses, the outbreaks have usually spread from Asia. Africa has also been visited.

The disease may appear under a mild or a grave form. In the mild form symptoms of fever and general lassitude are observed. Bladder-like eruptions appear, especially on the mucous membrane of the mouth, between the hoofs, and on the mammary gland. The last-named location is most frequently attacked during the secretory condition of the gland. Mammitis is a frequent complication of the disease. The mortality from this form of the disease in cattle is usually from two to fifty for each one thousand cases. In the grave form of the disease eruptions occur on internal mucous surfaces of the digestive or respiratory tracts. The symptoms in such cases are those of acute bronchitis, pneumonia, or enteritis, according to the part which is affected. The mortality in this form varies from 15 to 20 per cent. In sheep the eruptions on the feet are usually more serious and persist for a longer time. In sucking lambs the disease assumes the intestinal form, and is especially fatal. The disease spreads rapidly among animals confined in the same stable. Infection may be produced by the eruptions on the feet. Infected water is another common means of dissemination. The virus of the disease may gain entrance to the organism through the uninjured mucous membranes of the mouth, respiratory passages, or the alimentary tract. The pathogenic organism of this disease has never been isolated. The period of incubation after infection by natural methods is from two to six days. The virus is readily destroyed by desiccation or by exposure to air and sunlight. It possesses a weak resisting power to antiseptics such as carbolic acid and formaldehyde. Inoculation with serum from animals which have recovered from the disease does not confer immunity. Loeffler and Frosch succeeded in producing immunity to the disease by intravenous injections of lymph from aphthous subjects, but the results were not constant. No medicament has been found to have a specific action on the development of the disease. The mucous surfaces upon which eruptions occur may be washed with antiseptic solutions, and other symptoms may be combated as they appear. The chief reliance should be placed on proper sanitary measures. Diseased animals should be immediately isolated and infected stables should be strictly quarantined. It would be well to abandon the use of such stables until they have been thoroughly cleaned and disinfected.

The meat of aphthous animals is not considered dangerous as food for man. The milk of such animals is, however, highly infectious. The disease may also be contracted from eating infected butter and cheese. Consult: Nocard and Le-

clainche, *Les maladies microbiennes des animaux* (Paris, 1898); Murray, and others, "Special Report on Diseases of Cattle," in *United States Department of Agriculture, Bureau of Animal Industry* (Washington, 1892).

FOOTA TORO, fōō'tā tō'rō. See FUTA TORO.

FOOTBALL. An outdoor game played by opposing teams, with an inflated ball. The main object on each team's part is the passing the ball over or through the goal in the other team's territory. It is principally played in Great Britain, North America, and Australia, but varieties of it may be found in many parts of the world. In the Philippines and through the Polynesian Islands it is played with a light ball made of thin split fibres of the bamboo ingeniously twisted and interlaced. The Eskimo play it with a similar ball made of strips of leather. The Farøe Islanders and the Maoris of New Zealand both play a native football. The ancient Greeks and Romans played a game somewhat akin to football. English lads in very early times made use of the bladder without the covering in a contest out of doors. Barclay, an early poet (d. 1552), describes the game graphically, and William Fitzstephen, in his *Vita Sancti Thomæ*, at the end of the twelfth century notes the well-known game of ball played on Shrove Tuesday. So popular did it become that its history is for centuries almost entirely one of futile repressive measures. Edward II. (1314) forbade it on account of "the great noise in the city [London] caused by hustling over large balls," and it fell under the ban of succeeding sovereigns, both in England and Scotland. James I., who favored athletic pastimes, condemned football "as meeter for laming than making able the users thereof." With the triumph of Puritanism came the decadence of football; though it was maintained here and there as a game between villages, the goals at either end sometimes being as far apart as one village from another, and it was played intermittently and without any rules but tradition well into the nineteenth century. By 1849 it was played in the English universities, but its official entry into modern life, as a defined game, was in 1863, when rules were drawn up by players of the University of Cambridge and representative old public school men, and the present 'association' game came into existence by the federation of clubs known as the 'Football Association.' This association failed to satisfy those who had for years followed the game under the traditional rules of Rugby school, and in 1871 the 'Rugby Football Union' was established, and rules formulated for all those following that style of play.

In America the game had an independent origin, with varying practices and fortunes. It was played at Yale as early as 1840, and continued in a somewhat desultory manner until 1859. Then came a period when it fell into desuetude. It does not appear again as an active force until 1870. From that time onward its growth and popularity has been uninterrupted. Lack of uniformity in methods and rules threatened to restrict its sphere: A beginning of uniformity was made in 1873, when Columbia, Rutgers, Princeton, and Yale met in convention, and in 1875 the regular Rugby Union rules of that year were adopted; but after the first matches of that year it soon became evident that those rules were not adapted for America. In 1876

they were varied in material points, and they have been in continuous evolution ever since. The game played in Australia is, in like manner, an outgrowth of the English game. The Gaelic game is Irish football under its own rules, and must not be confused with the 'Irish Rugby Union' play. In Great Britain playing football in both its styles, 'association' and Rugby, has become so universal that each of the four component divisions of the United Kingdom has its national association in each game, and there are international associations controlling the contests between the four. 'Rugby' is controlled by an 'International Football Board' consisting of twelve members—six from England, and two from each of the other nationalities. All international matches are played under rules subjected to its approval, but it has no jurisdiction over the game as played within the limits of the four separate unions. 'Association' in its international relations is under the control of an 'International Association Board' composed of eight members, two of whom represent England, Scotland, Wales, and Ireland respectively. In both games a selection committee of each country is responsible for the team to represent it. Besides the great international contests there are contests of groups of counties, and of counties within the groups; of towns, one against the other; and of village against village. It is impossible to convey, in a general description, the extent of football ramifications in Great Britain. One illustration must serve: It is no unusual thing for the final match betwixt the 'North' and 'South' of England alone to be witnessed by 100,000 to 120,000 spectators, every one of whom pays for his admission, and most of whom have undertaken a railroad journey of from 20 to 300 miles to be present at the game.

In the United States the interest in football is not less keen, but is more restricted, little interest being taken in any other matches than those between the great universities; but 30,000 to 40,000 spectators at one of these have been recorded. There is no national association. The governing body nearest approaching that definition is the 'Rules Committee' of the University Athletic Club of New York.

ASSOCIATION FOOTBALL. This, the oldest of the organized games, differs in almost every detail by which a score is made, from both 'Rugby' and the 'American' game. It is more showy and active; kicking the ball is the almost exclusive method of play, nobody but the goal-keeper being allowed to touch the ball with his hands. It follows that the ball must in a very short period be in play in many different parts of the field, and that the area of contest, and the exhibition of skill, strength, nerve, and agility, must shift rapidly from point to point. The game is played on ground not more than 200 or less than 100 yards in length, and not more than 100 or less than 50 yards in width. The limits are marked by a white line and flags. The side lines are known as 'touch lines,' the end lines as 'goal lines.' The goals are upright posts, eight yards apart, and a crossbar eight feet from the ground. The ball is round, 27 to 28 inches in circumference, and when first put in play weighing not more than 15 ounces. It must pass *under* the crossbar between the goal posts to score. Eleven players constitute a team, i.e. one goal-keeper, two full-backs, three half-backs, and five

forwards. The goal-keeper is in the most critical position; upon him in the last instance depends victory or defeat, and the laws leave him a wide margin in preventing a goal. The most widely essential quality in the association game is kicking of various degrees, from keeping the ball dribbling along at the player's feet until a favorable position is obtained, to sending it skying over half the field to his colleague, or keeping it low and swift, so as to pass under the goal bar.

'RUGBY' FOOTBALL is played by fifteen players on each side, on a field not exceeding 110 yards long and 75 yards broad. The boundaries are defined by white lines; the ends of the boundary are called goal lines, the sides touch lines. In the centre of each goal line two goal posts are placed, 11 feet high and 18 feet 6 inches apart, and joined by a crossbar 10 feet from the ground. Over the bar and between the posts the ball must be kicked to score a goal. The ball is oval, from 11 to 11½ inches long, 30 to 31 inches in long circumference, 25½ to 26 in widest circumference, and weighing from 13 to 14½ ounces. The choice of in-goals, or the kick-off, is tossed for; the game is started by a kick-off. A kick-off is a place kick (i.e. the ball is placed on the ground and kicked) from the centre of the field of play. The opposing side must not stand within 10 yards, or charge until the ball is kicked. At the time of the kick-off all the kicker's side must be behind the ball. The ball may then be kicked or picked up and run with by any player who is on-side (except that it must not be picked up when in a scrimmage, or it has been put down after it has been fairly held, or when it is on the ground after a player has been tackled—i.e. held by one or more players of the opposite side). It may be passed or knocked from one player to another. When it is firmly held the one in possession cries 'Down!' the forwards of either side hurry up and a scrimmage is formed, the eighteen packed tightly round the ball, every one trying either to force the ball out toward his goal, or to 'screw' his opponents—i.e. slide them off the ball, so that his own team keeps well on it. Two methods have developed from the early scrimmage, each unlawful, but each played so uniformly and universally as to have become unwritten laws—i.e. 'wheeling' and 'heeling.' In wheeling the ball is secured on the formation of a scrimmage and nursed, until the bias of the scrimmage is felt, either to the right or left; then the wheel is made on the most favorable side by the back row bringing the ball round to the front, while the front row slides off its adversaries. In 'heeling,' possession of the ball is obtained, as in wheeling; then the forwards mask their manœuvre by a feat of packing hard, and heel the ball out. When the scrimmage is broken up the players break away *en masse*, and follow the man who holds the ball at full speed, while the object of the holder is to transfer it to one of his own side who is in a more advantageous position than himself, either by dribbling the ball with the foot or passing it by hand. The ball is in touch when it goes, or a player carries it, across the side, or touch, lines. It then belongs to the side opposite that last touching it in the field of play, except when carried in. One of the side to whom it belongs puts it into play again by bounding it on the field at right angles to the touch line, and then running in with it, or passing it, or throwing it in;

or he scrimmages it at any spot at right angles with the touch line, between 5 and 15 yards from the place where it was in touch.

THE AMERICAN GAME. Founded upon the principles of English football, the American game has become by constant evolution radically different. It has always been distinctively a sport of the universities, colleges, and schools. Its development has been due entirely to the larger universities, notably Yale, Princeton, and Harvard. From the time the game was first played in the early seventies until the early nineties, these three held undisputed supremacy, and the subsequent general dissemination of knowledge of the finer points of play has been largely due to the instruction of coaches, themselves trained in the Yale, Princeton, or Harvard systems. Early in the nineties the University of Pennsylvania began placing strong teams in the field, and since then such institutions as Columbia, West Point, Dartmouth, Cornell, Lafayette, Amherst, and Annapolis in the East, and Michigan, Minnesota, Chicago, Illinois, Northwestern, Nebraska, California, and Leland Stanford, in the West, have become factors in the yearly struggle for intercollegiate honors. Broadly speaking, American football is mimic war. The fundamental principle of successful offensive play lies in the quick concentration of attack against the weakest point in the opposing team.

A team consists of eleven men: seven forwards and four backs. The forwards are the centre, the right and left guards, the right and left tackles, the right and left ends. The backs are the quarter-back, the right and left half-backs, and the full-back. The forwards, with the exception of the two ends, are selected for weight and strength. The ends must have speed and sufficient weight and strength to break up the opponents' end attack. The quarter-back, who usually directs the attack, must possess generalship, speed, and ability in handling the ball. The other backs are chosen for their ability in advancing the ball on the attack and in backing up their own forwards when on the defense. At least one man on the team must be proficient in kicking. This man should naturally be the full-back, although another back or even a forward may take the full-back's position.

The officials or judges governing play are the referee, the umpire, the timekeeper, and the linesmen. The referee's duty has to do primarily with the progress of the ball up and down the field; the umpire has to watch the players, inflicting penalties for any violations of the rules; the timekeeper keeps track of the passing time, allowing for delays when so directed; the linesmen, by means of tape and poles, measure accurately the exact advance of the ball.

A game of football consists of two halves of thirty-five minutes' actual playing time each, although by mutual agreement the captains of the opposing teams may decide upon a contest of shorter duration. Between the halves there is an interval of ten minutes for rest. Before beginning a game the two captains toss a coin, and the winner may choose the goal, giving the opponents the kick-off; or take the kick-off, giving the opponents choice of goal.

The field is three hundred and thirty feet in length and one hundred and sixty feet in width. At each end, in the middle, are the goal posts, consisting of two upright posts exceeding 20

feet in height and placed 18 feet, 6 inches apart, with horizontal crossbar 10 feet from the ground. The whole field is inclosed by heavy white lines marked in lime upon the ground. It is desirable

to have the field marked off with white lines every five yards, parallel to the goal line, for measuring the distance to be gained in order to retain possession of the ball; and, also, to have the field marked with lines, five yards apart, parallel to side lines, in order to assist the officials in deciding whether the first man who receives the ball crosses the scrimmage line a sufficient distance from where the ball is put in play.

Victory in a contest goes to the side scoring the greater number of points. Five points are given for a touchdown, made by carrying the ball over the opponents' goal line. A touchdown entitles the scoring side to a try at goal, which, if successful, counts an additional point. Previous to 1904 five points were allowed for a goal from field or a goal from placement, but in that year the value of this play was reduced to four points. A goal from field is made in the actual scrimmage. It must be a drop kick—that is, the ball must be dropped to the ground and propelled by the foot at the moment of rebound, and must pass directly over some part of the horizontal crossbar. A goal from placement may be made from the scrimmage or may be the result of a fair catch. A safety is scored when a player is forced to touch down the ball behind his own goal. In the first years of the game this play had no material penalty, but since the early eighties it has counted two points for the opponents.

When, after preliminary practice, the two teams have taken their positions on the field and the ball is placed on the ground in the exact centre, the referee blows his whistle for the game to begin. One of the side having the kick-off kicks the ball as far as possible towards the op-

ponents' goal. One of the opponents catches it and, protected by his fellows, runs back until he is tackled and thrown. If the man kicking sends the ball beyond the goal line and it is there touched down, it is brought out to the 25-yard line, where one of the other side may send it down the field by a free kick. After the kick-off, which takes place at the beginning of each half, and after a score has been made, the teams resort to the regular scrimmage play of attack and defense. To retain possession of the ball a side must advance it a certain number of yards within three downs. Failing in this the ball is given to the other side to attack under the same conditions. The two fundamental means of carrying the ball towards the opponents' goal line are by forcing it through the line of defending forwards or by carrying it around the end. The first play may be made successfully by quickly opening up a hole through which the man carrying the ball dashes, or by pushing and hauling him along by sheer weight and strength. When two teams are evenly matched and neither can gain ground with certainty by rushing, kicking is an important factor; e.g., if the first two downs have failed to gain enough ground to make the retention of the ball by rushing probable, the attacking side generally decides to kick rather than run the chance of yielding the ball to the opponents where it is. Then, too, there is the chance of regaining the ball after a kick through an opponent's fumble.

In order, as far as possible, to equalize the resources of attack and defense, a great number of rules have been introduced. The ball being put in play by the centre, who tosses it back between his legs to the quarter-back, the latter must pass it on to a third man. At least three men must touch the ball before it can be advanced by rushing beyond the line of scrimmage. A qualification of this rule, for the purpose of making a more open game, was introduced in 1903. This is commonly known as the "quarterback run," and allows the second man touching the ball to carry it forward, provided he crosses the line of scrimmage at least five yards outside of the point where the ball was put in play. For a punt or drop kick the ball may be passed directly from the snapper back.

An important feature of the American game is what is known as "interference." Interference is the protection rendered the man carrying the ball by his team-mates blocking off the men who are attempting to tackle and throw him. In doing this they are allowed to make use of their bodies but not of their arms.

For violations of the rules of the game there are a number of penalties. For off-side play or forward passing five yards are given to opponents; for holding or illegal use of hands or arms and for interference with an opponent trying to make a fair catch, fifteen yards. Unnecessary roughness or striking is punished by disqualification. When a player is injured or disqualified he may be replaced by a substitute.

The American game is governed by the Rules Committee, which consists of a representative each from Yale, Princeton, Harvard, Cornell, Pennsylvania, University of Chicago, and Annapolis. For years it has favored a more open game, which will be more attractive to the spectator, and which will still retain the basic principles of the sport.

The *Canadian* game, which is popular in a number of Provinces, is played on a field of 110 X 65 yards, with fifteen men on a team. The 'heeling out' of the ball is a feature of the game. Points may be scored in several ways, the playing of the game as well as its scoring partaking largely of the character of the English Rugby game. *Gaelic* football is a very old Irish game which has been revived in recent years. It is played by teams of from fourteen to twenty-one players, generally fifteen. Besides the usual goal posts, there are outer point posts, which give added opportunities for scoring. The teams line up for play in two parallel lines, the opponents holding hands. The ball is then thrown into the centre of the line, and the game begins at once. Having caught the ball, a player may advance it by kicking or by striking with the hand; but he may not throw or carry it. A resulting method of play is that of 'hopping,' by which the ball is kept bounding between the hand and the ground while the player rapidly advances down the field. The game is characterized by active playing and hard kicking.

FOOTE, ANDREW HULL (1806-63). A distinguished officer of the United States Navy. He was born in New Haven, Conn., on September 12, 1806, the son of Samuel A. Foote (q.v.); studied at West Point for several months, and became acting midshipman in the navy on December 4, 1822. He was commissioned lieutenant on May 27, 1830; from 1837 to 1840 was executive officer of the *John Adams*, of the East India Squadron, during its cruise around the world, and from 1841 to 1843 was stationed at the Naval Asylum in Philadelphia, of which during the last two years he was in full charge. He was executive officer of the Boston Navy Yard from June, 1846, to June, 1848, and from 1849 to 1851, as commander of the brig *Perry*—his first independent command—cruised along the African coast for the purpose of protecting American commerce and suppressing the slave trade. In December, 1852, he was promoted to the rank of commander. After four years of shore duty he was appointed to the *Portsmouth*, April 5, 1856, and was ordered to join Commodore Armstrong's fleet on the East India Station. On arriving at Canton he established fortified posts on shore for the protection of American residents; but Commodore Armstrong soon afterwards ordered that the American marines be withdrawn, and while Foote was making arrangements to this end he was fired on from the so-called Barrier Forts (q.v.), which he stormed and captured a week later, acting under Armstrong's orders. Soon after his return—in October, 1858—he was appointed commandant of the Brooklyn Navy Yard, which position he relinquished, with the rank of captain, in August, 1861, soon after the beginning of the Civil War, to accept the command of the naval operations in Southwestern waters. On September 6, 1861, he assumed command at Saint Louis,

and for some time devoted himself with great energy to the task of preparing his flotilla for action. On February 6, 1862, he captured Fort Henry, and on the 14th he attacked Fort Donelson, before which Grant with his army had arrived two days earlier; but was repulsed, and he himself was wounded. (See FORT HENRY AND FORT DONELSON.) Island No. 10 (q.v.), after a siege by Foote and the forces under Pope, surrendered on April 7. On May 9, his wound having become serious, Foote left the command of the fleet in the hands of Capt. Charles H. Davis, and on July 17, 1862, at his own request, was formally detached from the Western Flotilla. He had become a flag officer in November, 1861, and on July 16 was promoted to be a rear-admiral. For several months in 1862-63 he was chief of the Bureau of Equipment and Recruiting, and on June 4, 1863, was appointed to succeed Rear-Admiral Dupont as commander of the fleet off Charleston, but died at New York, on June 26, while on his way to assume the duties of his new position. Foote published a book entitled *Africa and the American Flag* (1854), based largely on his African cruise of 1849-51. Consult Hoppin, *Life of Rear-Admiral Andrew Hull Foote* (New York, 1874).

FOOTE, ARTHUR (1853—). An American composer, born at Salem, Mass. He studied piano and harmony with Stephen A. Emery, and subsequently at Harvard University (class of 1874) with John K. Paine, continuing for a year after graduation. He was leader of the Glee Club and also chorister, his first published composition being the class-day song. On leaving college he studied piano and organ playing with B. J. Lang, and shortly afterwards settled in Boston. He gave many pianoforte and organ recitals there and elsewhere. His first composition performed in public was a gavotte, which Madame Essipoff played in a so-called 'American' concert in Boston in 1877. His first larger composition to have success was the *trio* in C major for piano and strings, about 1883. His compositions include works for orchestra (*Serenade* in E major for strings; overture, *In the Mountains*; prologue, *Francesca da Rimini*; suite in D minor); chamber music; chorus and orchestra (*Wreck of the Hesperus*; *Skeleton in Armor*; *Farewell to Hiawatha*); much church music, organ and piano pieces; and about sixty songs, among them the popular *Irish Folk-Song*; *I'm Wearing Ava*; *In Picardie*; *O Swallow, Swallow*; and *On the Way to Kew*. Foote's work has been rather more along classical lines (so called) than in the romantic school, but a tendency toward the latter showed itself in his later compositions.

FOOTE, HENRY STUART (1800-80). An American politician, born in Fauquier County, Va. He graduated at Washington College, Lexington, Va., in 1819, and after studying law and being admitted to the bar in 1822, removed in 1824 to Tusculum, Ala., where he practiced his profession and edited a Democratic newspaper. Two years later he removed to Jackson, Miss. He soon became a leader of the Democratic Party in his State, allying himself at first with the extreme States Rights branch. In 1847, however, he became a pronounced Unionist, and after a sharp contest was elected, in 1847, to the United States Senate. He favored the annexation of Cuba, Yucatan, and

Mexico, declaring that only thus could the continued possession of California and Oregon by the United States be assured. He was the author of the proposal for a grand committee of thirteen, which, after Webster had spoken in its favor, was accepted. It was this committee with Clay as its chairman that drew up the famous compromise measures. Later he introduced the 'finality resolutions,' by which the compromise laws were declared to be a "final settlement of all controversies growing out of slavery." In 1852 he resigned his seat in the Senate to enter the contest for Governor of Mississippi as the Unionist candidate in opposition to John A. Quitman, the leader of the Secessionist party. Quitman, soon realizing that there was no chance of his own election, withdrew in favor of Jefferson Davis, in spite of whose personal popularity, however, Foote was elected. On the conclusion of his term as Governor, Foote removed to California, but returned to Mississippi in 1858, and again entered the fight against the secession movement, participating in the Southern Convention at Knoxville, Tenn., in 1859, as one of the strongest opponents of disunion. Settling in Nashville, in spite of misgivings, he cast in his lot with the Confederacy upon the secession of Tennessee, and was chosen a member of the first and second Confederate Congresses. His personal attacks on Jefferson Davis, his old rival, were bitter and scathing. He was in Washington even before Lee's surrender, and after the restoration of peace, remained in that city, where his counsel was sought by the Northern leaders in regard to reconstruction matters. He became a strong supporter of Grant, whose Southern policy he favored, and by whom he was made director of the United States Mint at New Orleans, which position he held until shortly before his death. He published *Texas and the Texans* (1841); *History of the Southern Struggle* (1846); *History of the Civil War: or, Scylla and Charybdis* (1867); and *Personal Reminiscences*.

FOOTE, MARY HALLOCK (1847—). An American artist and novelist, born in Milton, N. Y., November 19, 1847. She studied art in New York, and in 1876 married Arthur D. Foote, a mining engineer. Since then she has lived in California, Colorado, and Idaho, which have given themes for her novels and drawings. She has also furnished elaborate illustrations for Longfellow's "Skeleton in Armor," and "The Hanging of the Crane." Representative of her fiction are: *The Led Horse Claim* (1883); *The Last Assembly Ball* (1889); *John Bowdoin's Testimony* (1886); *Cœur d'Alène* (1894); *The Chosen Valley* (1892); *In Exile* (1894); and *The Cup of Trembling* (1895). In all these the scenes are taken chiefly from Rocky Mountain country.

FOOTE, SAMUEL (1720-1777). An English actor and playwright, born at Truro, in Cornwall. In 1737 he entered Worcester College, Oxford, but left without a degree, and proceeded to the Temple. His fortune soon dissipated at the London coffee-houses, he turned to the stage for a means of support (1744). In 1747, with a piece entitled *Diversions of the Morning*, he opened the Haymarket Theatre, where he was at once director, actor, and dramatic author. In this and other pieces he introduced well-known living

characters, and by his admirable powers of mimicry succeeded in drawing large audiences, till the theatre was closed by order of the magistrates. He, however, managed to continue his dramatic performances by calling them 'teas.' These 'teas' closed in 1753, and Foote returned to the regular stage, writing and adapting many plays, and acting in many parts, in London, Dublin, and Edinburgh. In 1766 he broke his leg by a fall from his horse, and amputation was found necessary. Full of resources, he turned the incident to account on the stage, composing parts expressly adapted to his own state. He died October 21, 1777. Among his plays are *The Minor*, *The Liar*, and *The Mayor of Garratt*. Foote had a great reputation as a wit. His *Works* were edited by John Bee (Badcock) (London, 1830). Consult Cook, *Memoirs of Samuel Foote, with a collection of his bons mots* (London, 1805).

FOOTE, SAMUEL AUGUSTUS (1780-1846). An American politician, born in Cheshire, Conn. He graduated at Yale in 1797, and practiced law. After serving for some time in the Legislature he was at different times sent to Congress as a Whig (1819-27). During the following six years he was in the Senate. He was the author of the resolution 'on public lands,' which provoked the great debate between Senator Hayne of South Carolina and Webster of Massachusetts.

FOOT GUARDS. Select regiments of infantry, organizations common to European armies. In the British Army it includes the First, Second, and Third battalions of Grenadier Guards (q.v.), the First, Second, and Third battalions of Coldstream Guards (q.v.), the First, Second, and Third battalions of Scots Guards, and the Irish Guards, the First Battalion of which was formed in 1902. Like the German guard-corps, they are not locally distributed throughout the Empire, but have permanent stations. See **HOUSEHOLD TROOPS**.

FOOTMAN MOTH. A name among British lepidopterists for the small yellowish gray moths of the family Lithosiidæ, allied to the tiger-moths.

FOOT-POUND. The unit of work (q.v.) in the foot-poundal system, and corresponding to the amount of work required to raise one pound one foot vertically against the force of gravity at sea-level in latitude 45°. See **MECHANICAL UNITS**.

FOOTPRINT, FOSSIL. See **FOSSIL**; **ICHOLOGY**.

FOOT-ROT. A hoof-disease of sheep. Two varieties are recognized, the commoner consisting of an excessive growth of hoof, which at the toe, or round the margin, becomes turned down, cracked, or torn, and thus affords lodgment for sand and dirt. Irregular wearing of the hoof is the cause, and hence the prevalence of foot-rot in soft rich pastures, and especially among sheep previously accustomed to bare, rough, or upland walks, where the hoof is naturally worn down by the greater amount of walking necessary to procure sustenance. Taken in time, when lameness is first apparent, and before the hoof is cracked, and the foot inflamed, a cure rapidly follows the careful paring of the superfluous and diseased hoof; indeed, further treatment is scarcely necessary, unless the vascular parts have been laid bare, when a little tar may be applied as a mild

astringent and protection from flies. When, from inattention or neglect, the hoof is separated from the sensitive parts beneath, when ulcers appear on the sole, or proud flesh develops, active astringents or mild caustics are necessary. Butter of antimony, diluted with an equal quantity of tincture of myrrh, is a good remedy when cautiously and temperately used. A convenient paste, which in inexperienced hands is safer than a fluid caustic, may be made with equal weights of flowers of sulphur and finely powdered sulphate of copper, rubbed up to the needed consistency with lard or oil. Many have great faith in a mixture of this salt of copper with gunpowder and lard. The second and more troublesome variety is allied to what is termed 'foul in the foot'; instead of commencing at the ground surface, it begins in the interdigital space or at the coronet, and is contagious. The foot is hot, tender, and swollen around and immediately above the coronet. There are ulcerations in the interdigital space, and the swelling, and subsequently the appearance of proud flesh, cause a separation of the toes. When the tenderness and heat are great, poultices are advisable; but in the milder cases and earlier stages, the parts should be well washed with a solution containing to the pint of water half an ounce each of sulphuric acid and oil of turpentine. When ulcers appear, they must be touched with lunar caustic, or dressed with the paste already recommended. In the treatment of contagious foot-rot preference should be given to antiseptic solutions.

FOOTWALL. A term used in mining, to indicate the lower wall of an inclined ore body or coal seam. It underlies the ore body immediately and often serves as a slanting floor on which tracks can be laid for hauling up the ore. See **HANGING WALL**; **MINTING**.

FOOT-WASHING. An Eastern custom of very early times, having its origin in necessities produced by climate and modes of dress, and in the obligations attached to the rites of hospitality. In the most primitive times the feet were without covering, and sandals afforded protection only to the sole. Consequently, after any journey in the heat and sand, bathing the feet, if not absolutely required, was at least convenient and refreshing. From Scripture and other sources, we learn that the servants of a household were accustomed to perform this work for the guests, and thus it became a significant sign of hospitality. In memory and imitation of the example of Christ at the Last Supper (John xiii.), the earliest Christians were accustomed to regard it as a praiseworthy act of piety. By the end of the fourth century it was specially connected with the observances of the Thursday before Easter, when, at least in the churches of Africa, Gaul, and Milan, it was the custom for the bishop to wash the feet of the newly baptized with solemn ritual observances. When infant baptism became the rule, foot-washing was dissociated from the administration of the sacrament; but as a liturgical custom observed on Maundy Thursday, it became more and more generally practiced. Earlier editions of the *Ordo Romanus* do not mention it, but the later ones speak of the Pope performing the ceremony for twelve subdeacons. As in monasteries where was a twofold observance, by the brethren among themselves

and by the abbot and others for numerous poor people, so the Pope and other bishops added the washing of the feet of representative poor men, who also received food and gifts. It was also frequently, and is still in some courts (e.g. that of Vienna), practiced by monarchs. At Rome, while the Gospel narrative is sung (from whose first words in Latin, *Mandatum novum*, 'a new commandment,' John xiii. 34, the name of Maundy or Mandate Thursday is derived), the representatives of the Apostles take their seats, dressed in white woolen tunics, and the Pope, in similar attire, sprinkles a few drops of water on the right foot of each, then wipes and kisses it. After this a repast is given, at which the Pope and his Cabinet wait on the old men, who, at the close, take with them the tunics and towels, with the addition of a small gratuity in money. The Anabaptists, at the Reformation, continued the practice. The Moravians revived it, but without strictly enforcing it. In modern times it has been regularly practiced among the Dunkers (see GERMAN BAPTIST BRETHERN), Winebrenerians, and the Glassites or Sandemanians.

FOPPA, fôp'pâ, VINCENZO (called Il Vecchio) (?-1492). An Italian painter, born at Brescia. He was a pupil of Squarcione. Little is known of his life until he went to Milan, where he executed many important works. These were generally in fresco, and are now destroyed. Among them was a series of scenes from the life of Trajan, done about 1456. Foppa is generally considered the founder of the Milanese School. The pictures that remain of this uncommon and interesting master are very few; the best of them are: "Saint Jerome Praying," and a "Crucifixion," both at Bergamo; a fine altar-piece in Santa Maria di Castillo, Savona; "Saint Sebastian," and some fragments of fresco at the Brera in Milan; and "The Adoration of the Kings," in the National Gallery, London. The last years of his life were spent at Brescia, whither he returned in 1489.

FOPPINGTON, LORD. An ostentatious, ridiculous man of fashion in Vanbrugh's *Relapse*. He also appears in Cibber's *Careless Husband*, and in Sheridan's *Trip to Scarborough*, an adaptation of Vanbrugh's comedy. The character was suggested by Sir Novelty Fashion in Cibber's *Love's Last Shift*. Cibber himself created the rôle and made his reputation with it.

FORAGE (in agriculture). See FEEDING STUFFS.

FORAGE (OF. *fourage*, Fr. *fouirage*, from OF. *forrer*, to forage, from *forre*, *fuerre*, Fr. *feurre*, from ML. *fodrum*, forage, from *voder*, AS. *fôdor*, Eng. *fodder*, OHG. *fuotar*, Ger. *Futter*, food; connected also with AS. *fôda*, Eng. *food*, and with Gk. *παρέσθαι*, *patēsthai*, to feed). In military usage, the fodder issued by the Government for animals, the property of the State. In the United States Army, the forage ration for a horse, as provided in the Army Regulations, is 14 pounds of hay and 12 pounds of oats, corn, or barley; it being left to the department commander to reduce the ration when necessary. Where grazing is practicable, or when little labor is required, commanding officers are authorized to order a judicious reduction of the allowance. Forage is furnished only to officers for the horses owned and actually kept by them in the per-

formance of their official duties when serving with troops in the field or at military posts and stations.

FORAGING ANT. An ant of the Central American genus *Eciton*, usually called army ants in Nicaragua, because they go about in large bodies, making forays upon insects and other small animals. These columns may be three or four yards wide, and include many thousands of individuals. As they march forward smaller columns are pushed out ahead or on the flanks, which find and flush the prey. Larger animals flee; insects try to leap away, but more often jump into the midst of the ants, and even the largest are soon overpowered and torn to pieces. The ants explore thickets and brush-heaps, driving everything to the twigs and then catching and pulling them down; but spiders often escape by letting themselves hang by a silken thread. Birds accompany such a foray through the forest, and dart at the escaping insects, but do not eat the ants. Several species of *Eciton* inhabit the American tropics, one of which devotes its excursions to harrying the nests of a certain small and timid ant (*Hypoclinea*), which it ousts from its galleries and robs of pupæ and larvæ, but does not otherwise injure. "The moving columns of *Ecitons* are composed almost wholly of workers of different sizes, but at intervals of two or three yards there are larger and lighter-colored individuals that will often stop, and sometimes run a little backward, halting and touching some of the ants with their antennæ. They look like officers giving orders and directing the march of the column."

These ants are of various species and differ in size, food, and methods of foraging. The *Ecitons* are remarkable in having no permanent home. On the contrary, they make a temporary habitation in some hollow under a log, or in the ground, where great masses cluster together like a hanging swarm of bees, in the centre of which the larvæ and pupæ are kept warm. These, with their nurses, seem to occupy a chamber within a living nest, and tunnel-like entrances are kept open along which food is carried by those left at work outside. No ants show a greater sense of organization and mutual helpfulness than do these, and they seem to stand at the head of the tribe in point of intelligence. A circumstantial account of several species is given by Belt, in his *Naturalist in Nicaragua* (London, 1888), from which the sketch here given has been condensed.

FORAKER, JOSEPH BENSON (1846—). An American politician and legislator, born at Rainboro, Highland County, Ohio. In 1862, at the age of sixteen, he enlisted as a private in the Eighty-ninth Ohio Volunteer Infantry, and at the close of the war received the brevet rank of captain. Immediately after the close of hostilities he entered the Ohio Wesleyan University at Delaware, Ohio, and two years later entered the junior class at Cornell University, where he graduated in 1869. He studied law and was admitted to the bar at Cincinnati, where he practiced with success until 1879, when he was elected a judge of the Superior Court. He resigned from the bench in 1882, and in 1885 was elected Governor of Ohio on the Republican ticket. He was reelected in 1887, and was de-

feated for a third term, in 1889, by James E. Campbell, although all the rest of the Republican State ticket was elected. From his defeat as Governor in 1889 to 1897 he was engaged actively in the practice of law at Cincinnati, gaining a reputation as a corporation attorney. In 1897 he became United States Senator. In the Senate he immediately took an active and aggressive part in the debates, being one of the most radical advocates in that body of the war with Spain in 1898.

FORAMINIFERA (Neo-Lat. nom. pl., from Lat. *foramen*, hole + *ferre*, to bear). A name given by the French zoölogist D'Orbigny, in 1826, to a group of minute animals, which at that time were regarded as mollusks, because of their remarkable and beautiful shells. They were even ranked with the cephalopods because many of them possess shells spirally coiled, like that of the nautilus. In 1835, however, Dujardin recognized their true nature, and since his day the Foraminifera have been considered a subdivision of the Protozoa. They are now ranked as an order of Rhizopoda (q.v.), distinguished from the amoeba and its near allies by the form of the pseudopodia, which are very extensile and thread-like, and are constantly anastomosing so that they form a beautiful network of granular protoplasm. Another feature which serves to distinguish the Foraminifera is the presence of a shell, although not all rhizopods which have shells are of this order. The shell or 'test' of the Foraminifera may be chitinous, or calcareous, or arenaceous (that is, made up of particles of sand, mud, sponge-spicules, or other foreign material firmly glued together), but it is never siliceous. The shells are distinguished as 'perforate' or 'imperforate,' according as they have their walls penetrated, or not, by minute openings or canals through which the pseudopodia project. In nearly all cases there is a large opening through which the animal within the shell comes in contact with the surrounding water, and often there are two or more of these 'general apertures.' In the imperforate forms, the pseudopodia are extended only through these general apertures. The Foraminifera with chitinous shells are all *Imperforata*; those with arenaceous shells are usually *Imperforata*, but there are many perforate forms; those with calcareous shells show two very distinct sorts of tests, one group having them white, opaque, like porcelain, and imperforate, while the other has them transparent, glassy, and perforate. Marking or sculpturing of the surface of the shell is very common in both groups. In regard to the form of the shell we find a most extraordinary variety, but the most important point is whether they are monothalamous (unilocular), that is, composed of a single chamber; or polythalamous (plurilocular), that is, made up of several or many chambers. The latter forms arise by budding, from a single chamber, the buds remaining attached to the parent. Now since the monothalamous shells may be spherical, ovate, spindle-shaped, star-shaped, or tubular (straight, curved, or coiled) and symmetrical or quite asymmetrical, it follows that the polythalamous shells may be very complex and irregular. They are often very beautiful and sometimes reach a considerable size. The great majority of the Foraminifera are known by their shells alone, compara-

tively little being known of the animals themselves. In those which are known the contractile vacuole is wanting, and even the nucleus is usually indistinguishable, so that their structure would seem to be extremely simple.

In regard to their physiology we know that food is taken into the body in the form of minute organic particles, by means of the flowing or streaming movements of the protoplasm which makes up the pseudopodia. In addition to this food it is possible that some organic matter in solution in the water is also absorbed and used, for the ability to take carbonate of lime in solution and make use of it to form their shells is one of the most characteristic and obvious features of these animals. Their methods of reproduction are only partially understood. The processes of fission and of budding are constantly going on. In certain forms, reproduction takes place by the formation of spore-like young. These exceedingly minute germs move about by a single flagellum. Such a flagellum-bearing embryo is called a 'flagellula.' The Foraminifera are chiefly marine animals, but those with chitinous shells are found mostly in fresh water. They are all very small, practically microscopic, though the white shells of many of the marine forms are large enough to be seen with the naked eye; quite a number are from one to two millimeters in diameter, and the well-known genus *Orbitolites* has a polythalamous shell, sometimes 20 millimeters across, while *Nummulitis* is an inch in diameter.

The shells of Foraminifera are found all over the ocean floor except in the Arctic regions, and in many places form deposits of great extent and thickness. It was formerly supposed that the animals lived swimming about in the sea, and that it was only at death that the shells sank to the bottom, but it is now known that comparatively few species are pelagic, and it is probable that most species live on the bottom throughout life. Geologically, the Foraminifera occur from Cambrian times down to the present, though they have been most abundant apparently since the close of the Paleozoic era.

The classification of the Foraminifera is a matter of unusual difficulty, owing to the very great individual variation that occurs in the form and appearance of the shell. It is very doubtful whether the 'species' of this order are comparable with the species of higher groups, since little is known in regard to their reproduction and limits of variation. Ten families are now generally recognized, the lines of division being based on the composition of the shell, whether polythalamous or not, whether perforate or not, and on the relative arrangement of the chambers. The best-known families are the Gromidæ, which includes the fresh-water forms, of which Gromia and Microgromia are familiar examples; the Miliolidæ, including the huge *Orbitolites*; the Globigerinidæ, with the widespread *Globigerina*; and the Nummulinidæ, including the well-known and characteristic fossil forms *Fusulina* and *Nummulites*.

FOSSIL FORAMINIFERA. The oldest known Foraminifera appear in the Lower Cambrian rocks of the Province of New Brunswick, Can., where occur some minute spherical shells that cannot be distinguished in respect of either size, form, or microscopic structure from the modern spe-

cies *Orbulina universa*. Associated with these are species of *Globigerina*, very like those of modern times. Many Foraminifera are scattered through the overlying formations up to the Carboniferous system, where they suddenly appear in great abundance. Whole beds of limestone in Europe, Asia, Japan, and North America are formed by the closely crowded shells of the genera *Saccamina*, *Endothyra*, *Fusulina*, and *Schwagerina*. The two latter genera are not found above the Permian. Other extinct genera in the Carboniferous rocks are associated with species of genera that are still living in the Atlantic Ocean and the Mediterranean Sea. The Mesozoic rocks have also their Foraminifera in abundance. The genera of the family *Lagenidæ* are predominant in the Liassic and Jurassic systems. The chalk deposits of the Cretaceous age of Europe and America consist largely of foraminiferan shells (especially *Globigerina* and *Rotalia*), together with spicules of sponges. The members of the order reached their greatest development in Tertiary time, though most of the genera and species found in the rocks of that period are still living in the modern seas. The majority of these were more abundant in the earlier period than they are now. Certain other forms, like *Orbitoides* allied to *Nummulites*, are restricted to rocks of Tertiary age. *Nummulites* (q.v.) is an important index fossil of the Eocene series, in which its coin-shaped shells constitute great limestone beds in the Alps and Egypt.

The well-known *Eozoön* (q.v.), found in Laurentian limestones in Canada, has long been considered by some authors to be the oldest foraminifer, and likewise the oldest known fossil organism. Careful investigation has proved it to be a mineral concretion.

FORBACH, förbâg. A town in Lorraine, Germany, on an affluent of the Rossel, five and one-half miles southwest of Saarbrücken (Map: Germany, B 4). Glass, soap, and pasteboard are its manufactures. The place is mentioned as early as the tenth century under the name of Furfac. After the battle of Spichern, fought on the neighboring heights, August 6, 1870, the town was occupied by the victorious German troops. Population, in 1890, 9575; in 1900, 8209.

FORBES, förbz, ALEXANDER PENROSE (1817-75). Bishop in the Episcopal Church of Scotland. He was born in Edinburgh, and studied at the Edinburgh Academy, and under Rev. Thomas Dale, the poet, in Kent; he also attended the Glasgow University (1833), and won distinction as an Oriental scholar. In 1836 he obtained an appointment in the Indian civil service, and left England for Madras. Returning to his native country in 1839, he obtained a Sanskrit scholarship in Brasenose College. At Oxford he became associated with Pusey, Newman, and Keble; and in 1844 was ordained deacon and priest in the Church of England, and held a curacy. In 1846 he returned to Scotland for a while, but afterwards became Vicar of Leeds (1847). After the death of Bishop Moir, he was called to the See of Brechin (1848). In 1860 he was prosecuted for heresy, because he inculcated the doctrine of the Real Presence, but he made a powerful defense, and was acquitted with censure and admonition. His *Short Explanation of the Nicene Creed* (1853), and *Explanation of the Thirty-nine Articles* (1867-68), and various commentaries, reviews, etc., were highly esteemed. He edited the original lives of Saint Ninian, Saint Kentigern, and Saint Columba in the *Historians of Scotland*, vols. v. and vi. (Edinburgh, 1875); also *The Kalendars of Scottish Saints* (1872). He died at Dundee, Scotland, October 8, 1875. Consult Mackey, *Bishop Forbes: A Memoir* (London, 1888).

FORBES, ARCHIBALD (1838-1900). An English journalist. He was born in Morayshire, Scotland, in 1838. He studied at the University of Aberdeen; served for some years in the Royal Dragoons; and then became special correspondent for the *London Daily News*, in which capacity he accompanied the Prussian Army during the Franco-German War; witnessed the close of the Commune; visited India during the famine of 1874; accompanied the Prince of Wales on his tour through India (1875-76); and was in the Carlist War in Spain, the Servian War, and the Russo-Turkish War of 1877, etc. He lectured in Great Britain, the United States, and Australia. Among his many works are a military novel called *Drawn from Life* (1870); *My Experiences in the Franco-German War* (1872); *Life of Chinese Gordon* (1884); *William I. of Germany* (1888); *The Afghan Wars* (1892); *Tzar and Sultan* (1894); *Napoleon III.* (1898). He died March 30, 1900.

FORBES, DUNCAN, of Culloden (1685-1747). A Scotch judge and patriot, born November 10, 1685, probably at the family seat near Inverness. He was educated at Inverness Grammar School, and after completing his studies at the universities of Edinburgh and Leyden, became advocate at the Scottish bar in 1709. Through family influence he was soon appointed Sheriff of Midlothian, and rapidly acquired political power and a lucrative practice. In 1722 he became member of Parliament for Inverness; in 1725 was appointed Lord Advocate; and in 1737 reached the summit of his profession as Lord President of the Court of Session. His loyalty to the English Crown had been conspicuous in the Rebellion of 1715, and at the outbreak of 1745 he hastened north, and by his presence and influence did much to counteract the uprising. For advocating and exercising humanity toward the rebels he was accused as a suspect by Lord Lovat, who at-

tacked Culloden House, his residence, but was spiritedly beaten off by the President and his people. The rebellion spread, and Forbes fled for refuge to the island of Skye. After the battle of Culloden, he returned and zealously discharged his duties until he died, December 10, 1747. He was the author of some important theological works. Consult: Duff, *Memoir* attached to the *Culloden Papers* (London, 1815); Bannatyne, *Memoir* attached to *Works of Duncan Forbes of Culloden* (Edinburgh, 1816); and Burton, *Lives of Simon, Lord Lovat, and Duncan Forbes of Culloden* (London, 1847).

FORBES, EDWARD (1815-54). An English zoölogist. He studied medicine and other sciences in Edinburgh and Paris, and in 1841 became naturalist of the surveying ship *Beacon* during a voyage to Asia Minor. In 1843 he became professor of botany at King's College, London; in 1852 professor of natural history at the School of Mines, and president of the Geological Society; in 1853 professor at Edinburgh. He was a brilliant and voluminous writer. Important among his works are *History of British Starfishes* (1841); *History of British Mollusca* (with Hanley, 1853). Consult Wilson and Geikie, *Memoir of Edward Forbes* (Edinburgh, 1861).

FORBES, EDWIN (1839-95). An American artist, born in New York, and a pupil of A. F. Tait. He was special artist for *Frank Leslie's Magazine* during the Civil War, and the etchings he did at this time were given by General Sherman to the Government, and are now in the War Office at Washington. They are of historic value. Afterwards he painted landscape and cattle scenes, among which are "Orange County Pasture" (1879) and "Evening—Sheep Pasture" (1881). In 1877 he was made an honorary member of the London Etching Club.

FORBES, GEORGE, Earl of Granard (1685-1765). See GRANARD.

FORBES, HENRY OGG (1851—). A Scotch traveler, born at Drumblade. In 1878-83 he made extensive scientific travels through Sumatra, Java, Timor, and other islands of the East Indies. In 1885 and 1886 he explored British New Guinea. He was elected a fellow of the Zoölogical Society of London and of the Royal Geographical Society, and appointed director of the Free Public Museums of Liverpool. He published *A Naturalist's Wanderings in the Eastern Archipelago: A Narrative of Exploration and Travel from 1878 to 1883* (1885).

FORBES, JAMES DAVID (1809-68). A Scotch physicist and geologist. He was educated at the University of Edinburgh with a view to the law, but his natural inclinations led him to the study of physics. At the age of nineteen he was elected to membership in the Royal Society of Edinburgh, and five years later succeeded Sir John Leslie as professor of natural philosophy in the university, although opposed by Sir David Brewster. His studies on thermal radiations resulted in the important discovery of the polarization of heat, for which the Royal Society of London awarded him the Rumford medal. While traveling in the Alps, Forbes collected a vast amount of information bearing on the origin and movement of glaciers, and his book, which appeared in 1843, was the most valuable contribution on glacial phenomena that had been published up to that time. His investigations were

limited to the collection and arrangement of reliable data, but they were the means of overthrowing many crude conceptions and of directing future studies in the proper channels. Forbes received the degree of LL.D. from the University of Edinburgh, and was elected to membership in the Royal Society of London, the Geological Society, and many foreign scientific societies, including the Institute of France. He contributed a great number of scientific papers to the *Proceedings* of the Royal Society of Edinburgh. His more extended publications are: *Travels Through the Alps of Savoy and Other Parts of the Pennine Chain, with Observations on the Phenomena of Glaciers* (1843); *Norway, and Glaciers Visited in 1851* (1853); and *A Tour of Mont Blanc and Monte Rosa* (1855).

FORBES, JOHN (1710-59). A Scotch soldier, who served in America during the French and Indian War. For some time he was a physician in Scotland, but subsequently entered the army, served in the War of the Austrian Succession, became a colonel in 1757, and served for a time as quartermaster-general under the Duke of Cumberland. In December, 1757, he was sent to America as brigadier-general for service against the French and Indians, accompanied the Louisburg expedition as adjutant-general early in 1758, and in the summer of that year led the force of between six and seven thousand, which marched across Pennsylvania, and on November 25 took possession of Fort Duquesne, which had been evacuated by the French on the preceding day. In March, 1759, Forbes, who had been dangerously ill through the expedition, died in Philadelphia. Consult Parkman, *Montcalm and Wolfe* (Boston, 1884).

FORBES, Sir JOHN (1787-1861). A Scotch physician, born at Cuttlebrae, Banffshire. He studied at Aberdeen from 1805 to 1807, and from the latter year to 1816 acted as assistant surgeon in the navy. In 1817 he graduated in medicine at Edinburgh, then practiced his profession at Penzance and Chichester until 1840, when he removed to London. He was for years physician to the Queen and Prince Consort, and was knighted in 1853. He was a fellow of the College of Physicians and the Royal Society of London, and a member of numerous foreign societies. Jointly with Drs. Tweedie and Conolly, he edited the *Cyclopædia of Practical Medicine* (4 vols., 1832-35). In 1836 he founded the *British and Foreign Medical Review*, which he carried on for twelve years. In 1831 he published the first edition of his translation of *Lænnec's Treatise on Auscultation* (5th ed. 1838). Among his other works are: *Physician's Holiday* (1849); *Memoranda Made in Ireland* (1852); *Sightseeing in Germany and the Tyrol* (1856); *Nature and Art in the Cure of Diseases* (1857).

FORBES, JOHN MURRAY (1807-85). An American clergyman. He was born in New York, and graduated at Columbia College in 1827, and at the General Theological Seminary in 1830. He was ordained to the Episcopal ministry in the same year, and in 1834 became rector of Saint Luke's Church, New York, also acting for a time as professor of pastoral theology in the seminary. In 1849 he became a Roman Catholic, and after reordination was appointed pastor at Saint Ann's Church, New York, where (having been married before his conversion) he presented the

unique spectacle of a Catholic priest attended at the altar by his sons. In 1859 he returned to the Episcopal Church, and from 1869 to 1872 was dean of the General Theological Seminary.

FORBES, JOHN COLIN (1846—). A Canadian artist, born at Toronto. He was already proficient in his art before he went to London, where he studied at the Royal Academy, and afterwards in Europe. He settled in New York City. Among his works are the "Mount of the Holy Cross"; "The Foundering of the *Hibernian*"; "The Glacier of the Selkirk," and many portraits, including those of the Marquis of Dufferin, Gladstone, Sir Charles Tupper, and Sir John A. Macdonald.

FORBES, STANHOPE A. (1857—). An English genre painter, born in Dublin. He studied under Bonnat in Paris, and in 1889 received a first-class medal at the Paris Exposition. Among his works exhibited at the Royal Academy are: "The Fish Sale"; "By Order of the Court"; "Forging the Anchor"; and "The Village Philharmonic Society," bought by the Corporation of Birmingham. He is noted for his interior effects, which show much cleverness in the treatment of light.

FORBES, Sir WILLIAM, of Pitsligo (1739-1806). A Scottish banker and writer, born at Edinburgh. He was educated at Aberdeen. In 1761 he was admitted as a partner in the bank at Edinburgh of Messrs. John Coutts & Co.; and two years later a new company was formed, of which he ultimately became the head. In 1781 he purchased the estate of Pitsligo, Aberdeenshire, which had been forfeited by Lord Forbes of Pitsligo for taking part in the Rebellion of 1745. He introduced the most extensive improvements on it, and laid out and built the village of New Pitsligo. He was a member, with Johnson, Burke, Garrick, Reynolds, and others, of the celebrated Literary Club of London, was a friend of Dr. Beattie, the poet, and published *An Account of the Life and Writings of James Beattie, including many of his Original Letters* (2 vols. 1806). He also wrote the *Memoirs of a Banking House* (1803). His bank became, in 1838, the Union Bank of Scotland.

FORBES-ROBERTSON, JOHNSTON (1853—). An English actor, born in London. He early won some success as a painter, but went upon the stage when he was twenty-one years old, and has since been a member of various companies, including those of Sir Henry Irving and Sir Squire Bancroft. Some of his best-known performances have been those with Mrs. Patrick Campbell, in *The Notorious Mrs. Ebbsmith*, at the Garrick in 1895, and a little later as Romeo to her Juliet, at the Lyceum, where he assumed the management late in that year; as Constantine in *Coppée's For the Crown* (1896); and in 1897 as Hamlet, his best Shakespearean part.

FORBIDDEN FRUIT. A name fancifully given to the fruit of different species of the genus *Citrus*. In the shops of Great Britain, a small variety of the shaddock generally receives this name. But on the Continent of Europe a different fruit, regarded by some as a variety of the orange, and by some as a distinct species (*Citrus decumana*), is known as the forbidden fruit, or Adam's apple. The name forbidden fruit has also been given to the fruit of *Tabernamontana dichotoma*, a tree of Ceylon, of the order Apocynaceæ. The shape of the fruit, which is a follicle, con-

taining pulp, suggests the idea of a piece having been bitten off, and the legend runs that it was good before Eve ate of it, although it has been poisonous ever since. See *POMELO*; *SHADDOCK*; *CITRUS*.

FORBIGER, for'big-ër, ALBERT (1798-1878). A German philologist, born in Leipzig. He studied at the University of Leipzig, in 1824 was appointed an instructor in the Nikolaischule in that city, and in 1835 became its associate rector. His publications include an edition of *Vergil* (4th ed. 1872-75); *Handbuch der alten Geographie* (1842-43), a translation into German of Strabo (1856-62); and *Hellas und Rom* (1871-82), with A. Winckler.

FORBIN, for'bän', CLAUDE, Count de (1656-1733). A French mariner, born at Gardanne (Provence). After a wild boyhood he entered the navy and distinguished himself by reckless bravery in the campaigns of Messina (1675), the Antilles (1680), and Algeria (1682-83). He was sent to Siam as Ambassador in 1685, and so pleased the King of that country that he made him his grand admiral. In 1689 Forbin returned to France, and under Jean Bart fought against England, and was taken prisoner. From 1690 to 1707 Forbin was very active. He fought at The Hague and Lagos, and at the taking of Barcelona, and afterwards captured numerous English and Dutch vessels as commander of the French fleet (1707). A year later he was in command of an expedition to conduct the Pretender to Scotland, but failed, as the coast was too well guarded. After this Forbin retired from active life and lived at Marseilles, where he wrote his entertaining *Mémoires*, which were edited by Reboulet, and first published in 1729.

FORBONNAIS, for'bô-nâ', FRANÇOIS VÉRON DUVERGER DE (1722-1800). A French political economist, born at Le Mans (Sarthe). After study of business methods at Nantes, and travel in Italy and Spain, he was appointed inspector-general of the Mint in 1756, and in 1759 the head of the office of Silhouette, Comptroller-General of the Finances. His advice was frequently sought by the Constituent Assembly of 1790, in connection with the reform of the monetary system. He was elected a member of the Institute of France in 1794. He wrote extensively on economic questions. He was possessed of judgment of a high order and clear style, and his works not only influenced the administration of his day, but are still regarded as valuable. These include *Eléments du commerce* (2 vols., 1754); *Recherches et considérations sur les finances de France depuis 1595 jusqu'en 1721* (1758); and *Principes et observations économiques* (1767). Consult *Delisle de Sales, Vie littéraire de Forbonnais* (Paris, 1801).

FORCE (Fr. *force*, OSp., It. *forza*, from ML. *fortia*, *force*, from Lat. *fortis*, strong; connected with Skt. *brhan*, high). If the motion of a body is observed to be changing, that is, if it is observed to have an acceleration (q.v.), it is said to be under the 'action of a force.' As illustrations, changes in motion are observed if a heavy body is allowed to drop from the hand, if a piece of iron is brought near a magnet, if a piece of paper or dust is brought near an electrified body, etc.; and, therefore, one speaks of the 'force of gravitation,' 'magnetic force,' 'electric force,' etc. In every case, however, when there is a change in

the motion of a body, it may be shown that this change is in some way due to the presence of some other body, e.g. the earth, the magnet, the charged body; and it is shown in mechanics (q.v.) that the proper measure of this influence on the body which receives the acceleration is the product of the numerical value of its mass, and the numerical value of the acceleration received. Thus, if a body whose mass is m grams is moving with an acceleration a (measured in centimeters and seconds), an 'external force' of ma dynes is said to be 'acting on it,' since in the C. G. S. system the dyne is the unit of force. This acceleration may, of course, be due to the simultaneous 'action' of several forces, each of which by itself would have produced a different acceleration. In particular, if there is no acceleration, this does not necessarily mean an absence of external action; but may mean that there are two forces acting in opposite directions which are numerically equal. There are two general methods for measuring forces. One is to measure the mass and the acceleration; the other is to balance the force by one whose value is known. Thus, as all bodies fall toward the earth at any one place on the earth with the same acceleration when allowed to fall *freely*, viz. with an acceleration which may be called ' g ' and which nearly equals 980, the force of the earth on a body, whose mass is m grams, i.e. its 'weight' is mg . Consequently, if this body is kept from falling by being suspended by a cord, the cord must exert on the body an *upward* force whose numerical value is mg . If, therefore, it is required to apply a force F in a particular direction, it is simply necessary to attach a body whose mass m equals F/g to one end of a cord, pass the cord over a pulley (q.v.), and attach its other end to the body on which the force F is to act, in such a manner that the cord pulls in the specified direction. Similarly, if any force can be neutralized by the weight of a body of mass m this force must have the numerical value mg dynes. In this way 'magnetic' or 'electric' forces can be measured.

The 'field of force' of a body is the region through which it is possible to detect the action of forces on other bodies due to its presence. Thus, the field of force of gravitation of the earth extends far beyond the moon out into celestial space; the field of magnetic force of the earth also extends far out into space—how far, it is not known; the field of electric force due to a charged body is in general a limited region quite near it. The 'direction of the field' at any point is that in which a specified particle of matter placed at that point would move under the action of the given kind of force, if allowed to move freely. Thus, the direction of the field of gravitational force around the earth is always vertically toward the centre of the earth; the direction of a magnetic field of force is that in which the north pole of a minute magnet would move; the direction of an electric field of force is that in which a particle of matter positively charged would move. The subject of force plays an important part in all conditions involving physical measurements, and for a further discussion of the matter the student of physics is referred to one of the modern treatises on physics. Consult: Everett, *Centimetre - Gramme - Second System* (London, 1875; and Daniell, *Text-Book of the Principles of Physics* (New York, 1894).

FORCE, MANNING FERGUSON (1824-99). An American soldier, writer, and lawyer, the son of Peter Force (q.v.). He was born in Washington, D. C., and graduated at Harvard College in 1845, and at the Harvard Law School. On the outbreak of the Civil War he entered the Federal Army as major of the Twentieth Ohio Volunteers; at the close of the war was brevetted major-general of volunteers. Refusing a colonelcy in the Regular Army, he resigned from the service, and subsequently was Judge of the Court of Common Pleas of Hamilton County, Ohio (1867-77); Judge of the Superior Court of Cincinnati (1877-87), and commandant for many years of the Ohio Soldiers' Home. He published: *From Fort Henry to Corinth* (1881); *Marching Across Carolina* (1883); *Personal Recollections of the Vicksburg Campaign* (1885); *Life of Justice John McLean*, and *Some Early Notices of the Indians of Ohio*; and *To What Race Did the Moundbuilders Belong?* (1879). He also edited Walker's *Introduction to American Law* (1878), and Harris's *Principles of Criminal Law* (1880). He began the preparation of the biography of General Sherman (1899), in the "Great Commanders Series," but failing health forced him to give up the task.

FORCE, PETER (1790-1868). An American scholar and historian, born at Passaic Falls, N. J. He learned and worked at the printer's trade in New York City, removed to Washington in 1815, and in 1820-36 published the *National Calendar*, a statistical annual. From 1823 to 1830 he was proprietor and editor of the *National Journal*, the official newspaper of the John Quincy Adams Administration. He was Mayor of the city of Washington in 1836-40, and in the latter year was elected the first president of the National Institute for the Promotion of Science. In 1836-46 he published a valuable series of *Tracts and Other Papers Relating to the Origin, Settlement, and Progress of the Colonies in North America, from the Discovery of the Country to the Year 1776* (4 vols.). But he is best known for his *American Archives*, a documentary history of the English colonies in North America, published at the expense of the Government under an act of Congress of 1833. Nine volumes, covering the period from 1765 to 1776, appeared in 1847-53, but the work was then discontinued owing to the refusal of Marcy, Secretary of State, to approve further volumes. Force's unique library, including 30,000 pamphlets and more than 20,000 volumes, and consisting principally of Americana, of which he was the earliest important collector, was purchased by the Government in 1867 for \$100,000, and incorporated with the Library of Congress. Force was also regarded as an authority on the literature of Arctic discovery. His further publications were *Grinnell Land* (1852), and *Record of Auroral Phenomena Observed in Higher Northern Latitudes* (1856).

FORCE BILL. In American political history, the name applied to several bills passed by the United States Congress. See NULLIFICATION; RECONSTRUCTION; KU-KLUX KLAN.

FORCE DE CHEVAL, *fôrs de she-vâl'* (Fr., horse-power). A French unit of power equal to 736 watts (q.v.), and corresponding to the English 'horse-power,' which is equivalent to 746 watts. It is the rate of work or activity equiva-

lent to 75 kilogrammeters per second. See MECHANICAL UNITS.

FORCED MARRIAGE, THE. (1) A tragedy-comedy by Mrs. Aphra Behn, produced at the Duke's Theatre in 1671. Its first performance is remarkable from the appearance of Otway in the rôle of the King. His ill success in the part made this his only appearance on the stage. (2) A tragedy by John Armstrong, written in 1754, but not published until 1770.

FORCELLINI, fôr'chêl-lê'nê, EGIDIO (1688-1768). An Italian philologist. He was born on August 26, 1688, in a village near Padua. Owing to the limited means of his family, Forcellini was deprived of early instruction, and was already verging toward manhood when enabled to commence a regular course of study in the seminary at Padua. His industry, combined with his powers of learning, won the admiration of the principal, Giacomo Facciolati, who associated him with some of his own scientific labors. The pupil rendered his teacher valuable service in the compilation of a highly important lexicon, a work which probably inspired both with the project on which Forcellini's literary repute is based—the compilation of a comprehensive vocabulary of the Latin language. The work was published after Forcellini's death, and was one of the most valuable acquisitions to philological science of the age. In addition to the Italian and Greek signification of the Latin word, the literal and figurative application of each expression is given in a collection of examples, embracing the customs, laws, arts, sciences, religion, and history of the Romans. So full are the citations that it has been said that, if the whole body of extant Latin literature were destroyed, it could be in great part recovered from the quotations given in this lexicon. The work was published in four volumes, folio, under the title *Totius Latinitatis Lexicon, Consilio et Cura Jac. Facciolati, Opera et Studio Eg. Forcellini Lucubratum* (1771). The last edition, with an Onomasticon, was published by De Vit (Prato, 1858-60). Forcellini died in Padua, April 4, 1768.

FORCEPS (Lat., pincers). The name given by surgeons to an instrument of great antiquity, used as a substitute for the fingers, and consisting of two levers of metal jointed together crosswise, usually nearer to one end than the other. The hand grasping the longer ends of the levers or handles, closes the shorter ends, which are shaped so as to seize firmly the intended object. There is scarcely a surgical operation in which it is not applied. The variety is almost innumerable. In addition to the forms used in dentistry, there are in common use the *dissecting* forceps, which has roughened points, to lay hold of small portions of tissue which are to be divided by the knife; the *lithotomy* forceps, which has blades concave like spoons, while other forms of this forceps are adapted for seizing stones of various shapes and sizes; and *artery* forceps, with locks for seizing and holding the extremities of bleeding vessels. By means of Liston's *cutting* forceps, a powerful hand can divide a great thickness of bone. One of the most important of all forceps is the *obstetric* forceps, an invaluable invention in cases of difficult delivery. It consists of two concave fenestrated blades, forming a cavity into which the head of the child fits. The blades are applied

separately, one to each side of the head, and then locked together. Holding by the handles, the accoucheur aids the natural efforts of labor. The instrument does not necessarily or generally injure either mother or child.

FORCHHAMMER, fôr'châm-mêr, JOHANN GEORG (1794-1865). A Danish geologist. He was born in Husum, Schleswig, studied at Kiel and Copenhagen, and was associated with Oersted and Esmarch in a mineralogical exploration of Bornholm. In 1831 he became professor of mineralogy in the university and curator of the geological museum at Copenhagen. He succeeded Oersted in 1851 as director of the Polytechnic School and secretary of the Academy of Sciences. His researches (jointly with Steenstrup and Worsaae) on the prehistoric anthropology of the north of Europe, have yielded results of great importance. Among his publications are: *Krystallographie* (1833); *Danmarks geognostiske Forhold* (1835); and *Bidrag til Skildringen af Danmarks geografiske Forhold* (1837).

FORCHHAMMER, PETER WILHELM (1801-94). A German classical archaeologist and mythologist, brother of Johann Georg Forchhammer. He was born at Husum, Schleswig, and studied at the University of Kiel, where he became professor extraordinary in 1836. In 1830 he visited Italy and Greece, and in 1838 undertook a second journey to Greece, Asia Minor, Egypt, and Rome, which bore fruit in valuable contributions to the topography of ancient Hellas and the Greek settlement in Asia. Among these works were *Hellenika* (1837) and *Ueber die Reinheit der Baukunst* (1856), in which he traced the four styles of Greek architecture to climatic conditions and differences in materials. He also wrote treatises on the philosophy of Aristotle and on the archaeology and mythology of Greece. In his works on the latter subject he invariably regarded the Hellenic myths as personified embodiments of natural, and especially aquatic, phenomena. Among these publications mention should be made of his *Achill* (1853); *Daduchos* (1875); *Die Wanderungen der Inachostochter Io* (1881); *Erklärung der Ilias auf Grund der topischen und physischen Eigentümlichkeiten der troischen Ebene* (1884); *Prolegomena zur Mythologie als Wissenschaft und Lexikon der Mythensprache* (1891); and *Homer: Seine Sprache, die Kampfplätze seiner Heroen und Götter in der Troas* (1893). His early work, *Die Athener und Sokrates* (1837), contained many original ideas that were at first ridiculed, but afterwards were accepted by prominent historians. Forchhammer sat in the Prussian Diet from 1868 to 1870, and from 1871 to 1873 was a member of the German Reichstag.

FORCHHEIM, fôr'ch'hm. A town in Upper Franconia, Bavaria, near the junction of the Wiesent with the Regnitz, on the Ludwigskanal, 16 miles south-southeast of Bamberg (Map: Germany, D 4). It has a castle and a Gothic church. Its manufactured products include machinery, cloth, and paper. Forchheim was an important town in the days of Charlemagne, and in the ninth and tenth centuries was the meeting-place of many royal diets. From 1007 to 1802 it was held by the bishops of Bamberg, except during an interval of about thirty years. In its vicinity the French, on August 7, 1796, gained a

victory over the Austrians. Population, in 1900, 7590.

FORCIBLE ENTRY AND DETAINER. The taking or keeping possession of real property through threats or force, with no authority of law. To make such forcible entry there must be such acts of violence, menaces, or gestures as may give reason to anticipate personal injury or danger in making a defense. But the force must be more than is implied in mere trespass. There are in most of the States statutes regulating proceedings in cases of forcible entry, directing the manner of proceeding for the restoration of property unlawfully withheld and the punishment of the offender. The plea of ownership is not a justification of the defendant, for no one may enter even upon his own property in any other than a peaceable manner. Nor can he be excused on the plea that he entered to enforce a lawful claim or make a distress, nor on the plea that possession was finally obtained by entreaty. The policy of this legislation is to prevent the disturbance of the public peace, and to compel disputants to settle their controversy in a court of justice.

Originally by the common law of England the right of entry upon land of which one had been unlawfully deprived might be exercised by force or threats, if necessary. But by a series of early statutes, the first of which dates back to the time of Richard II., this remedy was limited to an entry "in a peaceable and easy manner, and not with force or strong hand." See **ENTRY**, **RIGHT OF**.

FORCING (in horticulture). The acceleration of vegetation by application of artificial heat. The term is not usually applied to the cultivation of exotic plants in hothouses, where the object is to imitate as much as possible their native climate; but it is strictly applicable to the system usually pursued with grapes, pine-apples, tomatoes, and other plants, to secure the production of fruit at desired seasons, and by different plants of the same kind in succession through a considerable period; the heat being increased for one set of plants sooner than for another. Many of the fruits and vegetables which grow well in the open air are very commonly forced, in order that they may be procured out of their natural season. Thus, rhubarb is forced by means of the heat produced by heaps of fermenting manure. Asparagus, salads, radishes, lettuce, onions, etc., are often forced by means of hotbeds, or in flued pits, or a place is found for them in hothouses. Strawberries are treated in the same way. See **HOTBED**; **HOTHOUSE**.

FORCKENBECK, fôr'k'en-bêk, MAX VON (1821-92). A German Liberal politician, born at Münster, Westphalia. In 1858 he was elected a member of the Prussian House of Representatives; in 1862 became a founder of the organization styled the 'Fortschrittspartei,' or 'Party of Progress,' and in 1866 of the National Liberal Party. He was elected president of the House in 1866. From 1867 until his death, except for the period from 1887 to 1890, he was a member of the Reichstag, and from 1874 to 1879 its president. He sat in the Prussian House of Peers from 1873, as chief burgomaster of Breslau, and from 1878 until his death he was chief burgomaster of Berlin. He displayed considerable ability as a party leader and presiding officer.

FORD, EDWARD ONSLOW (1852-1901). An English sculptor, born in London. He studied in 1870 at the Antwerp Royal Academy, in 1871-72 at the Munich Royal Academy, became an associate of the Royal Academy in 1888, and a Royal Academician in 1895. He was also elected a corresponding member of the Institute of France. His more important works include statues of Sir Rowland Hill (1882), at the Royal Exchange, selected in open competition by the committee of the Corporation of London; of Gladstone (1883), at the City Liberal Club, London; of Sir Henry Irving as Hamlet (1885); and of C. G. Gordon ('Chinese' Gordon) (1890), at Chatham. Others are the Marlowe Memorial at Canterbury; the Shelley Memorial at University College, Oxford; and a statue of Huxley (1900), at the British Museum of Natural History.

FORD, EMANUEL. An Elizabethan romancer. He was the author of *Parismus*, in two parts (1598-99), long exceedingly popular, and of the similar romances, *Ornatus and Artesia* (1607) and *Montelion* (1633, but probably published earlier).

FORD, Sir FRANCIS CLARE (1828-99). An English diplomat. He was commissioned a lieutenant in the Fourth Light Dragoons, but left the army in 1851, entered the diplomatic service, and became secretary of legation at Washington, where he was acting chargé d'affaires in 1867-68. In 1871 he was appointed secretary of embassy at Saint Petersburg, and in 1872 was transferred to Vienna. He represented the British Government in 1897 at Halifax before the International Commission, by decision of which a sum of \$5,500,000 was awarded to Great Britain as compensation for superior advantages obtained by the United States in the Washington fisheries treaty of 1871. From 1878 to 1879 he was Envoy Extraordinary and Minister Plenipotentiary to the Argentine Republic, and during a portion of the time to Uruguay also. He was afterwards appointed to similar posts at Rio de Janeiro and at Athens; in 1884 became Minister (from 1887 Ambassador) to Spain; in 1892 was transferred to Constantinople, and in 1893 to Rome. His services to British diplomacy won for him frequent official recognition, including appointment to the Privy Council in 1888.

FORD, JOHN (1586-?). An English dramatist, son of Thomas Ford, of Ilstington, Devonshire. After studying for about a year at Exeter College, Oxford, he was admitted a member of the Middle Temple (November, 1602). His first publication was an elegy on the Earl of Devonshire, entitled *Fame's Memorial* (1606), to which was prefixed a dedicatory sonnet to Lady Penelope, Countess of Devonshire, the Stella of Sidney's verse. This was followed the same year by *Honor Triumphant*. His dramatic career began in 1613, when his play *An Ill Beginning Has a Good End* was produced at the Cockpit. Thereafter he wrote many plays (e.g. *The Bristow Merchant*, tragedy, 1624), single-handed or in collaboration with Dekker, Rowley, and Webster. His two most powerful tragedies are *'Tis Pity She's a Whore* (1633) and *The Broken Heart* (1633). After 1639 nothing more is heard of him. Ford belongs to a group of Jacobean dramatists who wrote for an audience demanding sensation, complicated plots, and strong motives.

Pathos he exaggerated for dramatic effect. Nevertheless, his tragedies contain some of the greatest scenes after Shakespeare. In comedy he was weak. His *Dramatic Works*, with those of Massinger, were edited by Hartley Coleridge (new ed. London, 1883), and an edition of *Plays, selected*, by Ellis, appeared in the "Mermaid Series" (London, 1888).

FORD, JOHN THOMSON (1829-94). An American theatrical manager, born at Baltimore. He became manager of the Holliday Street Theatre in Baltimore, where he was elected president of the Municipal Council (1858), and was Acting Mayor for two years. At Washington, D. C., he built three theatres, one of which was that known as Ford's Theatre, the scene of the assassination of President Lincoln by Booth on April 14, 1865. On suspicion of complicity in connection with the deed, he was arrested and imprisoned for forty days. He was then released, inasmuch as absolutely no evidence was adduced against him. In 1871 he built Ford's Grand Opera House at Baltimore. He was long one of the board of governors of the Maryland Penitentiary, and at one time president of the board of directors of the Baltimore and Ohio Railway.

FORD, MASTER. In Shakespeare's *Merry Wives of Windsor*, a jealous husband, to whom, under the name of Master Brook, Falstaff relates the course of his attempted wooing of Mrs. Ford.

FORD, PAUL LEICESTER (1865-1902). An American historian and novelist, born in Brooklyn, N. Y. He was privately educated, and after wide travels in both hemispheres he devoted himself to investigations in the sources of American history, and edited the *Writings of Thomas Jefferson*, in ten volumes (1892); the *Writings of Thomas Dickinson* (2 vols.); *The Federalist* (1886), etc. These studies led to *The True George Washington* (1896); *The Many-Sided Franklin* (1899); and *The New England Primer*, with many minor writings of like character. To fiction he contributed: *The Honorable Peter Sterling* (1894); *The Great K. & A. Train Robbery* (1897); *The Story of an Untold Love* (1897); *Tattle Tales of Cupid* (1898); a collection of short stories; *Janice Meredith* (1899); *Wanted: A Matchmaker* (1901); and *Wanted: A Chaperon* (1902). Mr. Ford also did valuable work in the *Bibliographer*, which he founded, and of which he was editor at the time of his death.

FORD, RICHARD (1796-1858). An English writer. He graduated at Trinity College, Oxford, in 1817, and was afterwards called to the bar, but never practiced. He spent four years traveling in Spain, and in 1845 published his delightful *Handbook for Travelers in Spain*. A second edition was smaller in bulk, and the material left out was published in *Gatherings from Spain* (1846). Ford also contributed important papers on Spanish art to the *Quarterly Review* and other periodicals. In 1837 he published a pamphlet entitled *Historical Inquiry into the Unchangeable Character of a War with Spain*.

FORD, WORTHINGTON CHAUNCEY (1858—). An American author and statistician, born and educated in Brooklyn, N. Y. After several years spent in the publishing and newspaper business, he was appointed, in 1885, chief of the Bureau of Statistics of the Department of State in Wash-

ington, continuing in that position until 1891. From 1893 to 1898 he was chief statistician of the Treasury Department, and in the latter year became connected with the Boston Public Library. In 1902 he was also appointed expert accountant to the municipal government of New York City. He wrote *The American Citizen's Manual* (1883); *The Standard Silver Dollar* (1884); *George Washington* (1901), and numerous monographs and pamphlets on historical, biographical, and economic subjects. He revised David A. Wells's *Natural Philosophy* (1879), and edited the *Correspondence and Journals of Samuel Blachley Webb* (1893-94) and *The Writings of George Washington* (1889-91), his most important work.

FORDHAM. Formerly a village in Westchester County, N. Y., but since 1874 a part of New York City, being now included in the Borough of the Bronx. Saint John's College, a Jesuit institution, is situated here (Map: Greater New York, D 2). Originally, along with Yonkers, in the possession of Adrian Vander Donck, Fordham was erected into a manor in 1671, and became a separate parish in 1850.

FORDIL'LA (Neo-Lat., named in honor of the discoverer, S. W. Ford). A small bivalve shell found in the limestones of Lower Cambrian age of Rensselaer and Columbia counties, New York, and supposed to be the oldest known pelecypod or clam-shell. See CAMBRIAN SYSTEM; PELECYPODA.

FORD'S THEATRE. A Washington theatre, in which President Lincoln was assassinated by Booth, April 14, 1865. The building was purchased in 1866 by the United States Government, and was used until 1887 as the Army Medical Museum, and later as the Pension and Records Bureau of the War Department. It collapsed, with the loss of many lives, on June 9, 1893.

FORDUN', JOHN OF (?-c.1384). A Scottish historical writer. He was probably a chantry priest in the Cathedral of Aberdeen. He is said to have traveled on foot through Britain and Ireland in search of materials for a chronicle of Scotland, which he had set himself to compile. This was probably between 1363 and 1384. He died probably in 1384, or a little later. Of his *Chronica Gentis Scotorum* he wrote five books, extending to 1353, and a part of Book VI., which deals with English history. His *Gesta Annalia* extend from 1353 to 1383. The work which John of Fordun left unfinished was continued by Walter Bower (q.v.). Fordun's chronicle is the chief authority for the history of Scotland prior to the fifteenth century, its value being greatest for the fourteenth, where it is contemporary. Four printed editions have been published, of which the best is that by Skene (Edinburgh, 1871-72), from the text of the Wolfenbüttel and other standard manuscripts. Bower's interpolations and additions are separated from Fordun's text.

FORECAST, WEATHER. See METEOROLOGY; WEATHER BUREAU.

FORECLOSURE. The legal process whereby a mortgagor's right, or 'equity,' of redemption is cut off and the mortgagee's lien on the mortgaged lands or goods enforced. In order to put a limit on the 'equity of redemption' of the mortgagor (see EQUITY OF REDEMPTION) the remedy of foreclosure was devised by the Court of Chancery. It is available to the mortgagee at any

time after default, and is instituted by a bill of foreclosure praying that an account may be taken of the principal and interest due under the mortgage, and that the mortgagor, on failing to pay by a specified date, may forfeit his equity of redemption. If on the day fixed for payment the money be not forthcoming, the mortgagor will be declared to have forfeited his equity of redemption, and the mortgagee will be allowed to retain the estate in perpetuity. This method of enforcing the security of the mortgagee of lands is still in use in England and in many of the United States.

In a few of the American States, however, in which the mortgage has come to be regarded as a mere lien, and not as a legal estate in the mortgagee, a statutory process, known also as a foreclosure, has been adopted in lieu of the foregoing process of 'strict' foreclosure. This differs from the older method principally in the fact that it involves the satisfaction of the debt, not by a forfeiture, but by a sale of the mortgaged premises. The suit, which is also in equity, is instituted by the mortgagee as plaintiff, the mortgagor and all creditors, subsequent lienors, and other parties in interest, being made defendants. The demand is for a judgment that the defendants be foreclosed and cut off from all their interest in the mortgaged premises, and that the same be sold to satisfy the mortgage debt. The sale is made upon notice, and is at public auction, generally by the sheriff or a referee appointed by the court. After the sale the money in the hands of the referee will be applied to the payment of the mortgage, and any surplus may be claimed by subsequent mortgagees; or, if there is no other claim upon it, it will be paid to the mortgagor. Other methods of effecting a foreclosure, by legal rather than equitable process, as by a writ of entry or of ejectment directed by the mortgagee against the mortgagor, also occur in a few States. See **EQUITY OF REDEMPTION; MORTGAGE;** and the authorities there referred to.

FOREIGN ATTACHMENT. A process which a few local courts of England have authority, by immemorial custom, to issue. The custom of the Mayor's Court of London is that when a foreigner defendant, of whom the court has jurisdiction, does not appear in response to a summons served on him, the plaintiff may attach his goods or debts due to him as security to enforce his appearance. Recent decisions of the House of Lords have so narrowed the custom and have pointed out so many difficulties of procedure under it that it has fallen into disuse. In this country the attachment or garnishment of the goods or debts of non-residents is regulated by statutes in the several States. See **ATTACHMENT; GARNISHMENT;** and the authorities there referred to.

FOREIGN JUDGMENT. The judgment of a tribunal in a jurisdiction independent of that in which it is sought to be enforced. The effect to be given to such a judgment depends either upon treaty or the comity of nations. A government is not bound to enforce a judgment rendered in another country, nor even to recognize its existence, unless it has agreed to do so. As a matter of courtesy, however, toward sister States, as well as from considerations of convenience to suitors, each civilized nation is ac-

customed to treat a foreign judgment as conclusive upon the parties thereto concerning the matters decided by it, unless it is shown that the judgment was obtained by fraud, or that the court granting it did not have jurisdiction.

The States of the United States are foreign to each other so far as their judicial systems are concerned. They are subject, however, to the Federal Constitution, which declares that "full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof." (Art. IV., Sec. 1.) This does not mean that a judgment obtained in one State can be enforced by an *execution* issued in another State. It only means that if an action is brought upon such judgment in another State, or if the judgment is pleaded there in bar to an action brought for the same cause, it shall receive the same credit that it would receive in similar circumstances in the State where it was rendered.

By common law a foreign judgment is proved by an exemplified copy under the great seal of the State, or by a true copy proved to be such by a witness who compared it with the original, or by the proper certificate of an officer duly authorized by law. Special methods of proving such judgments are provided by statute in the various States. (See **DIVORCE; JUDGMENT.**) Consult Freeman, *Treatise on the Law of Judgments* (4th ed., San Francisco, 1892).

FOREIGN LAW. The law of a foreign country. The law of a State is, under modern conditions, entirely without authority in any other country, though foreign States may, as a matter of international comity, recognize the validity of acts legally performed in other countries, and may even, under proper conditions, administer the rules and principles of foreign law in its own tribunals. As to the circumstances under which this will be done, see **CONFLICT OF LAWS.**

For judicial purposes the several States of the Union are foreign to each other, though the comity subsisting between them is of the strongest character and has led to an extraordinary development of the principle of the recognition of the validity of judicial acts of one State in another. See **FOREIGN JUDGMENT; EXTRADITION.**

The courts of a country do not take judicial notice of foreign laws, but, where they are in issue, require them to be proved as matters of fact. Foreign statutory law may be proved by duly certified copies of the statutes in question, or even by printed compilations issued by the authority of the State enacting them. Foreign customary, or unwritten, law, however, can be proved only by the sworn testimony of properly qualified experts, though it has been held in the United States that the law of a kindred system like that of England may be established for judicial purposes by the citation of reported cases and text-books of recognized authority. In general, the courts of the several United States will take judicial notice of the laws of sister States, though in some of the States proof of the law of other States is required by the citation of reported cases, and the like. The Federal courts of the United States, however, even in matters in which

they have no jurisdiction, will always take judicial notice of the laws of all the States. See COMITY OF NATIONS and INTERNATIONAL LAW.

FOREIGN MONEY, VALUE OF. For the purpose of fixing the rates at which the different for-

eign coins shall be computed for the purpose of determining the values of goods imported into the United States, it is made the duty of the Director of the Mint to publish from time to time the values of foreign coins. This was formerly

VALUE OF FOREIGN COINS*

COUNTRY	Standard	Monetary unit	Value in terms of U. S. gold dollar	Coins
Argentine Republic.....	Gold.....	Peso.....	\$0.965	Gold: argentine (\$4.824) and ½ argentine. Silver: peso and divisions.
Austria-Hungary	Gold.....	Crown.....	.203	{ Gold: former system—4 florins (\$1.929), 8 florins (\$3.858), ducat (\$2.287) and 4 ducats (\$9.149). Silver: 1 and 2 florins. Gold: present system—20 crowns (\$4.052); 10 crowns (\$2.026).
Belgium.....	Gold.....	Franc.....	.193	Gold: 10 and 20 francs. Silver: 5 francs.

Ecuador.....	Gold.....	Sucre.....	.487	Gold: pound (100 piasters), 5, 10, 20, and 50 piasters.
Egypt.....	Gold.....	Pound (100 piasters).....	4.943	Silver: 1, 2, 5, 10, and 20 piasters.
Finland.....	Gold.....	Mark.....	.193	Gold: 20 marks (\$3.859), 10 marks (\$1.93).
France.....	Gold.....	Franc.....	.193	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
German Empire.....	Gold.....	Mark.....	.238	Gold: 5, 10, and 20 marks.
Great Britain.....	Gold.....	Pound sterling.....	4.866½	Gold: sovereign (pound sterling) and ½ sovereign.
Greece.....	Gold.....	Drachma.....	.193	Gold: 5, 10, 20, 50, and 100 drachmas. Silver: 5 drachmas.
Haiti.....	Gold.....	Gourde.....	.965	Gold: 1, 2, 5, and 10 gourdes. Silver: gourde and divisions.
India.....	Gold.....	Pound sterling.....	4.866½	Gold: sovereign (pound sterling). Silver: rupee and divisions.
Italy.....	Gold.....	Lira.....	.193	Gold: 5, 10, 20, 50, and 100 lire. Silver: 5 lire.
Japan.....	Gold.....	Yen.....	.498	Gold: 5, 10, and 20 yen. Silver: 10, 20, and 50 sen.
Liberia.....	Gold.....	Dollar.....	1.000	
Mexico.....	Silver....	Dollar.....	.417	Gold: dollar (\$0.983), 2½, 5, 10, and 20 dollars. Silver: dollar (or peso) and divisions.
Netherlands.....	Gold.....	Florin.....	.402	Gold: 10 florins. Silver: ½, 1, and 2½ florins.
Newfoundland.....	Gold.....	Dollar.....	1.014	Gold: 2 dollars (\$2.027).
Norway.....	Gold.....	Crown.....	.268	Gold: 10 and 20 crowns.
Persia.....	Silver....	Kran.....	.071	Gold: ½, 1, and 2 toman (\$3.409). Silver: ¼, ½, 1, 2, and 5 krans.
Peru.....	Gold.....	Sol.....	.487	Gold: libra (\$4.8665). Silver: sol and divisions.
Portugal.....	Gold.....	Milreis.....	1.080	Gold: 1, 2, 5, and 10 milreis.
Russia.....	Gold.....	Ruble.....	.515	Gold: imperial, 15 rubles (\$7.718), and ½ imperial, 7½ rubles (\$3.859). Silver: ¼, ½, and 1 ruble.
Spain.....	Gold.....	Peseta.....	.193	Gold: 25 pesetas. Silver: 5 pesetas.
Sweden.....	Gold.....	Crown.....	.268	Gold: 10 and 20 crowns.
Switzerland.....	Gold.....	Franc.....	.193	Gold: 5, 10, 20, 50, and 100 francs. Silver: 5 francs.
Turkey.....	Gold.....	Plaster.....	.044	Gold: 25, 50, 100, 250, and 500 piasters.
Uruguay.....	Gold.....	Peso.....	1.034	Gold: peso. Silver: peso and divisions.
Venezuela.....	Gold.....	Bolivar.....	.193	Gold: 5, 10, 20, 50, and 100 bolivars. Silver: 5 bolivars.

* The coins of silver-standard countries are valued by their pure silver contents, at the average market price of silver for the three months preceding the date of this circular.

† The 'British dollar' has the same legal value as the Mexican dollar in Hong Kong, the Straits Settlements, and Labuan.

‡ The sovereign is the standard coin of India, but the rupee (\$0.3244½) is the money of account, current at 15 to the sovereign.

done annually, but the fluctuating value of silver coins led in 1890 to a change in the law, requiring the statement to be made quarterly. Gold coins are reckoned by comparing the number of grains of fine gold which they contain with the amount of gold in the dollar. Silver coins are reckoned at the average value of the pure metal they contain during the three months prior to the determination of their value. When the values are determined by the Director of the Mint and proclaimed by the Secretary of the Treasury, they are valid in estimating the value of imports for the succeeding three months. The statement for October 1, 1902, is shown on the preceding page.

FOREIGN TRADE. See IMPORTS AND EXPORTS; FREE TRADE; TARIFF; BALANCE OF TRADE.

FOREIGN WARS, MILITARY ORDER OF. An hereditary patriotic society instituted in New York City in 1894, as the Military and Naval Order of the United States, but known under its present name since 1895. The objects of the order are to honor and preserve the names and memory of those who aided in maintaining the United States Government in the five foreign wars in which it has been engaged—namely, the War of the Revolution, the War with Tripoli, the War of 1812, the Mexican War, and the War with Spain—and to collect the records and documents relating to these wars. It admits to membership Veteran Companions, consisting of commissioned officers of the army, navy, and marine corps of the United States who participated in any of these foreign wars, and also Hereditary Companions, direct lineal descendants of commissioned officers in the main line. The national organization is made up of twenty-two State commanderies. The Order has a membership of over 1600 companions, among whom are many of the leading officers of the army and navy. This Order has been officially recognized by several European monarchs.

FOREKNOWLEDGE AND FOREORDINATION. Terms of theology, signifying God's knowledge of all things before they come to pass (foreknowledge); and the eternal purpose which finds its execution in time in the government of the history of man (foreordination). By some the divine foreknowledge and the divine foreordination are thought to have no dependence upon each other, pertaining to different spheres of the divine attributes and activity; by others foreordination, as respects the acts of free creatures, is thought to depend upon the foreknowledge of what those acts will be; or, again, foreknowledge to depend upon foreordination.

There are various theories of foreknowledge. (a) It is viewed simply as one of the divine perfections, absolute because the nature of God is infinite, and thus embracing all events whatsoever, including the volitions of free beings, but capable of no explanation except that it is a fact of the nature of God. Foreknowledge is no more of a mystery upon this view than any knowledge, or any other attribute of God. (b) A kindred view adds an element of explanation from the 'ideality of time.' There is no time to God, and hence foreknowledge, in the human sense of that word, does not exist. To know the future does not essentially differ from the knowledge of the present, for all the future is present to God. (c) Foreknowledge depends upon fore-

ordination. God has in some sense foreordained all things, and what He foreordains He knows, not with an immediate vision, as is supposed by the previous theories, but by the knowledge of inference and imagination. (d) The foreknowledge of God is limited by the freedom of man, inasmuch as he cannot foreknow contingent volitions which are essentially uncertain. This is a voluntary self-limitation, since God has Himself given His creatures freedom. It involves no derogation from the greatness or the dignity of God. And it is only one example of the numerous limitations which He put upon Himself in the creation, and particularly in the redemption of man. (See KENOSIS.) This theory has been proposed at various periods in history, but has always met with rejection as militating against the infinity of God. It is, however, finding increased favor at the present day in many quarters.

The proofs of God's foreknowledge are derived from the perfection of God and from the Scriptures. Even men have a certain kind and degree of foreknowledge, which is absolutely essential to them in the regulation of life. If God were nothing more than an infinite man, He must have at least the same sort of foreknowledge, and in an infinite degree. This proof is reinforced by the Scriptures, which ascribe the most various and minute foreknowledge to God. Yet neither of these proofs goes so far as they have often been supposed to go. The foreknowledge ascribed to God in the Scriptures is very vast, as it must be in the nature of the case. But the Bible is not a metaphysical book, and leaves the question still unanswered whether there may not be some events, one perhaps in a hundred thousand, which God does not foreknow. In fact, many of the representations of Scripture, though often interpreted as anthropomorphisms, are in favor of a certain lack of knowledge of the future. Nothing in Scripture answers the question whether free volitions are in themselves subject to foreknowledge. Many are; for, though free in their essential nature, they are made in conformity with the balance of motives, and may be foreknown. This fact is the foundation of society. But, while volitions remain free, are there none that are unaccountable, against the balance of motives, and hence uncertain? That is the question of free will (q.v.); and it would be false exegesis which would rest its determination upon passages of Scripture.

Foreordination pertains to all events. So much is maintained by all theologians. Some teach that all events are embraced in foreordination in the same sense and way. This theory differs from fatalism because intended to be consistent with the freedom and responsibility of the creature; and it may be consistent if determinism (see FREE WILL) is consistent, as was maintained by Edwards and many others. Commonly a distinction has been made between foreordination and permission. The first sin of man is then said to have been permitted, and the lost are said not to have been 'reprobated,' but 'passed over' by electing grace; that is, left in the sinful state into which they have voluntarily brought themselves. Others, with more direct reference to free will and with a conception of the divine government as a moral government—that is, one through persuasives acting upon the will—have

said that foreordination is the determination in the first instance as to what God will Himself do. From what He does, often follows immediately what men do, as in regeneration which leads to conversion, or when He does not do what would prevent sin. Thus He often indirectly foreordains what men shall do. This indirect foreordination will ultimately extend to the entire circumference of the government of God, and it will be in such a sense that it can be said that God foreordains 'whatsoever cometh to pass.' The divine government embraces all things even when it is in part a government of permission.

While the proofs of the divine foreordination are derived from the Scriptures, which are full of declarations as to what God will do, the proof is also rational. The proof of the existence of God involves in it the idea of plan (teleological argument), and plan is foreordination. Conceived as the plan of the world and of the history of man, foreordination may be interpreted by the actual course of events. Whatever may be said about speculative points, it is thus indubitable that God planned to create the world, to place man in it, to provide for his salvation when he had sinned, to lead Israel through all the crises of its history toward the moment when the Redeemer could be sent, to send the Redeemer, and to conduct the Church through those courses of revival and reformation when fallen into declension, by which its present degree of success has been attained. And as all this involves the existence of a chosen people, and this, again, the choice of individuals as its members, foreordination involves election (q.v.).

The grounds of this plan are to be found in the infinite wisdom and goodness of God. Whatever may be the success with which various schools have made this clear, such has been the meaning of all theologians. The most extreme schools of supralapsarians have believed that the lost were lost in consequence of their own sin, for which they were guilty, and which deserved in justice precisely the punishment they received; and they have also believed that justice must be done, and that neither wisdom nor goodness could permit it to go unsatisfied. The doctrine of election, which is but a corollary of foreordination, has often been regarded as a doctrine of favoritism. But theologians have never meant this by it. They have always founded it in the wisdom and goodness of God. They have often maintained that God elected every one who could be gained to righteousness by all the resources of His government. They have sometimes taught that more efforts were put forth for the finally lost than for some who were actually saved. The differences between the schools upon this doctrine have often been resolvable into this, that some referred a given fact to God, because it was under His government though by permission, while others ascribed it purely to man because done by him, though confessedly under a governmental permission.

The consistency of plan with free agency must be a real consistency under the divine government because it is real under human governments. A human governor can successfully determine to conquer a country under the conditions in which he is placed, and can successfully carry out his determination, as when Frederick

the Great conquered Silesia. God can do the same. The attempts of philosophy to explain this consistency do not affect its reality, whether more or less successful. Consult: Mozley, *Treatment on the Augustinian Doctrine of Predestination* (London, 1855); McCabe, *The Foreknowledge of God and Cognate Themes* (New York, 1878). See FREE WILL.

FOREL, fô'rel', AUGUSTE (1848—). A Swiss entomologist and psychologist. He was born at Morges (Canton of Vaud); studied at the universities of Zürich and Vienna, became a lecturer at Munich in 1876, and later held the chair of psychiatry at Zürich, from which he resigned in 1897. He was connected as assistant and director with various institutions for the insane. His publications include the prize essay *Les fourmis de la Suisse* (1874); *Der Hypnotismus* (1889; 4th ed. 1902); *Gehirn und Seele* (1894; 6th ed. 1899); and *Die psychischen Fähigkeiten der Ameisen und einiger anderen Insekten* (1901).

FOREL, FRANÇOIS ALPHONSE (1841—). A Swiss physician and naturalist, brother of the preceding, born at Morges (Canton of Vaud). After medical studies he was appointed professor of anatomy and physiology in the University of Lausanne. His studies concern the glaciers and lakes of Switzerland. His contributions to the natural history of the latter have appeared in *Le Léman* (1892-96), and in the *Handbuch der Seenkunde* (1901).

FORELAND, NORTH AND SOUTH. Two promontories on the east coast of Kent, England. NORTH FORELAND, the *Cantium* of Ptolemy, forms the northeast point of the county, and is in latitude 51° 22' N., two miles east of Margate (Map: England, H 5). Its chalk cliffs, nearly 200 feet high, projecting into the North Sea, are crowned by a lighthouse, with a fixed light, 184 feet high visible 24 miles.—SOUTH FORELAND, also composed of chalk cliffs, 16 miles south of North Foreland and 3 miles northeast of Dover, has two fixed lights, respectively 380 and 275 feet above the sea, and visible about 25 miles (Map: England, H 5). They indicate the proximity of the dangerous Goodwin Sands (q.v.), and the anchorage of the Downs (q.v.).

FORENSIC MEDICINE. See MEDICAL JURISPRUDENCE.

FORESHORTENING. That view of a figure or portion of a figure which, obeying the laws of perspective, diminishes in actual extent according to the angle at which it is seen. For example, a figure looked at from below becomes condensed, as it were, in length, and in portraying such an abrupt view there would be less space demanded than if the figure stood upright on the same level as the observer. In the same sense an arm extended and pointing directly out of the picture would require less actual space on the canvas than an arm laterally extended. The representation, then, of this effect of reduced space suggesting at the same time the actual length of the object, is termed foreshortening. It is practiced more or less by all painters as occasion demands, and it is always called for in the painted ceiling where figures are represented as above one's head. Some of the chief masters of foreshortening among the Italians were Melozzo da Forlì, Luca Signorelli, Michelangelo, Tintoretto, and, especially, Correggio, who, in his frescoes of

the cupola of Parma went further than had any before him. His example was followed by painters of the Baroque and Rococo period, who introduced foreshortening into their works merely for the purpose of parading their technical skill. In modern times greater care prevails, and foreshortening is practiced only with reference to the laws of perspective.

FOREST (OF. *forest*, Fr. *forêt*, It., ML. *foresta*, forest, from Lat. *foras*, *foris*, out of doors, *fores*, door, Gk. *θύρα*, *thyra*, OChurch Slav. *dviri*, Lith. *dūrys*, Goth. *daúrōns*, OHG. *turi*, Ger. *Thür*, AS. *duru*, Eng. *door*). A tract of land covered with a natural growth of trees. From the standpoint of vegetation the world may be roughly divided into forest, grassland, and desert, the area of each being determined by various climatic factors. Among these climatic factors atmospheric moisture takes a prominent place, as can readily be seen in comparing a vegetation chart of the world with a rainfall chart. Other things being equal, the greater the rainfall, the richer the forest. Forests seem to be in a measure independent of the seasonal distribution of rain, since they occur in regions of daily rain, of summer rain, or winter rain. Endurance through dry seasons is made possible by the great depth of tree-roots, and also by the thick and leathery leaf-texture in the case of evergreens, or by the shedding of leaves in deciduous trees. Because of the heat, more water is required by a tropical forest to meet the demands of transpiration than by a forest in the temperate zone. Another factor, perhaps of equal importance with moisture, is wind. Kihlman has shown that the presence or absence of trees in arctic regions is not a question of cold, nor even of a season's length, but of winter winds; trees grow only where they are protected from the great loss of water by transpiration induced by dry winter winds by being buried under the snow; the height of the trees thus marks the winter level of the snow. Since the winds of eastern Argentina are strong during the resting period, grassland is present, though the moisture is sufficient for a forest.

The forest formations of the world may be divided into eight types, based chiefly on the ecological characters of the leaves. (See LEAF.)

(1) The evergreen forest of the tropical regions of diurnal rainfall. This forest is especially well developed in the regions of the trade winds in oceanic climates, as of Brazil and Malaysia. This type is often called the rainy forest, and may be taken as representing the climax of the world's vegetation. Here plants grow in vast profusion and great diversity of form, and lianas, or climbing plants, and epiphytes reach their greatest development. Simultaneous periodicity is largely wanting, so that the forest is always in active life. (2) The deciduous monsoon forest, especially characteristic of the monsoon district of India, differs from the forest first named chiefly in having simultaneous periodicity. The other characters of the rainy season are present, but in a less complete degree. (3) The evergreen forest of the temperate zone is essentially an extension of the tropical evergreen forest into the cooler regions, especially of the Southern Hemisphere. It is peculiar to pronounced oceanic climates with markedly uniform temperature and moisture. (4) The deciduous forest of the north temperate zone is the typical forest formation of

the eastern United States. The forests of beech, maple, chestnut, oak, etc., are too familiar to need description. The radical difference between the forests of the same latitudes in the Northern and Southern hemispheres is doubtless associated with the continental climates of the one and the oceanic climates of the other. (5) The deciduous savanna forest of the tropical and warm temperate regions is transitional between forest and grassland (q.v.), having a park-like aspect, which is due to scattered trees in a district where grasses form the chief undergrowth. Such a forest commonly has a moderate rainfall. (6) The thorny or scrubby forest of tropical and warm temperate regions where the rainfall is slight is transitional between forest and thicket (q.v.). (7) The forest of temperate regions where the rainfall occurs in winter, is finely shown in the Mediterranean region; coarse and leathery but large evergreen leaves, like those of the holly, laurel, oleander, and the evergreen oaks, may be taken as typical of such regions. (8) The conifer forests, the pines and firs with their leathery, needle-shaped evergreen leaves, form great forests in the colder regions of the temperate zones, especially of the Northern Hemisphere.

The forests heretofore discussed are all climatic and widespread. Edaphic (q.v.) or local forests also occur. Indeed, in most of the regions where the above climatic types are found, there are localities in which other forest combinations are present. For example, in a swamp in the deciduous zone of the northern United States there may be found tamarack, spruce, and white cedar. Close observation in such a place for many years would doubtless show the gradual dying out of these trees and their replacement by the ordinary members of the deciduous forest. On a hill there may often be found a pine-plant society, but this is not a permanent condition. Pines are often likely to be followed in a natural sequence by oaks, and they in turn by maples and beeches. These changeable plant societies may be called edaphic, while the ultimate forest toward which all are tending may be called the climatic formation. Viewed in this light the eight great forest types outlined above are forest formations.

FORESTALLING. The buying of provisions with a view to enhancing the price thereof in open market. This was a common-law offense, and was the subject of early and repeated legislation. It was described by statute of 5 and 6 Edw. VI., ch. 14, as the buying or contracting for any merchandise or victual coming in the way to market; or dissuading persons from bringing their goods or provisions there; or persuading them to enhance the price when there. It was analogous to engrossing (q.v.) and regrating (q.v.). Modern conditions of trade have rendered these practices legitimate and the laws intended to regulate them obsolete; while at the same time the abuses referred to have, under the name of 'corners' and monopolies, become more flagrant and oppressive. The laws against forestalling, etc., were formally repealed in England by statute 7 and 8 Vict., ch. 24. In the United States they have remained unenforced. Consult the authorities referred to under CRIMINAL LAW.

FOREST CANTONS, THE FOUR. The four cantons of Schwyz, Uri, Unterwalden, and Lucerne, in Switzerland.

FOREST CITY, THE. A name given to Cleveland, Ohio, famous for its shade-trees.

FORESTER, FRANK. A nom-de-plume of Henry William Herbert (q.v.).

FORESTERS, ANCIENT ORDER OF. A fraternal organization founded in 1745 when a Court of Foresters was established at Knaresborough Castle, in Yorkshire, England. The Order has existed continuously since then, and was introduced into the United States in 1832, by the establishment of Court Good Speed, 201, in Philadelphia. The growth of the Order was slow until 1864, when Court Brooklyn, 4421, was organized. In 1902 the courts numbered approximately 9000, with a total membership of nearly 1,000,000. The Order is one of the largest beneficiary societies in existence, with courts in 36 countries, a reserve fund of \$36,000,000, and an income of \$6,000,000. Funds are raised by fixed dues, and more than \$5,000,000 annually are distributed in benefits.

FORESTERS, INDEPENDENT ORDER OF. A fraternal and benevolent society founded at Newark, N. J., in 1874, and reorganized in 1881. The Order is general throughout the United States and Canada, and has branches in Great Britain, Norway, France, India, and Australia. Its government is vested in a Supreme Court, with delegates from all the countries represented. High Courts, corresponding to the Grand Lodges of other societies, have supervision of the Order in various States and countries. Of these High Courts there were, in 1902, 20 in the United States, 8 in the British Isles, and one in Norway. The local bodies are called courts. The Order has a membership of some 200,000, has paid more than \$11,000,000 in benefits since its organization, and has a surplus fund of over \$5,600,000.

FORESTERS OF AMERICA. A benevolent and fraternal organization known under its present title since September, 1895. Originally the Order was part of the Ancient Order of Foresters, founded in England in 1745, and introduced in the United States in 1832. In 1889, however, the American Order freed itself from the jurisdiction of the High Court in England, and became a separate organization. It had, in 1902, some 1600 courts, or local branches, and a total membership of over 200,000. Its annual payments for benefits amount to \$1,000,000.

FOREST FLY. The British name of a small, widely distributed fly (*Hippobosca equina*), representing that aberrant division of Diptera styled Eproboscidea (see FLX) and the family Hippoboscidae. These minute insects are flea-like in appearance and habits, dwelling altogether as parasites among the hairs of animals and feathers of birds, and are sometimes called 'bird-ticks.' A common species on large birds in America is *Olfersia Americana*. Species of another genus, Lipoptera, have wings when young and live upon birds, but after a time they migrate to some mammal, and there, having no further use for their wings, wrench or bite them off. Another genus, Melophagus, includes the wingless sheep-ticks; a whole family, the spider-like bat-ticks (*Nycteribiidae*), inhabit the fur of bats alone; and another includes the bee-louse (*Braulidae*). All obtain their living by piercing the skin and sucking the blood with an extensile tube thrust

out from the mouth. It is in this manner that the forest fly torments horses, especially the short-haired, thin-skinned animals of high breeding. An extraordinary feature in the economy of all these flies is that they do not lay their eggs, but retain them until they hatch into larvæ, and the larvæ are almost ready to pupate; not until then are they extruded by the parent, and only one is produced at a time. Hence the group has been named Pupipara by some systematists.

FORESTI, fô-rês'tê, ELEUTARIO FELICE (1793-1858). An Italian patriot and scholar. He was born at Conselice; graduated at the University of Bologna, practiced law at Ferrara, and in 1816 was made prætor at Crespino. In 1819 he was arrested as one of the Carbonari, and was kept in prison until 1836, when he came to the United States. He was for many years professor of Italian in Columbia College, and in 1858 he was appointed United States consul at Genoa. He published an edition of Ollendorff's Italian grammar (1846), and *Crestomazia italiana* (1846).

FOREST LAWS (in England). Laws for the government of the forests in the King's possession. Such forests were vast tracts of country, containing not only woodland, but pastures and even villages, which might belong to other individuals than the King. Smaller tracts of woodland were called chases, or, if inclosed, parks, and might be included in a royal forest. The forests varied in number and extent at different times and were situated in different parts of the kingdom. Among the best known were New Forest, in Hampshire, Windsor Forest, and Epping Forest.

Most of them, indeed, dated from the Anglo-Saxon period, and having their origin in the uninclosed woodlands which had been national property, became royal demesne in the eleventh century. But all the Norman and early Plantagenet kings attempted, with varying success, to increase the forest area by afforestation, a summary proceeding, which consisted in simply proclaiming the desired tract a forest, after it had been inclosed with metes and bounds by royal commission. Sometimes the people were allowed to remain, but subject to the strict forest law; often they were ruthlessly driven away. The increase of the forest area was not only attempted by such high-handed monarchs as William I. and his sons. Until the fourteenth century it was a recurring source of complaint against the kings. Such wise kings as Henry II. and Edward I. were guilty of the same practice, and it was not until 1301 that the latter finally yielded to the wishes of his people, and permanently put an end to afforestation by force. When Henry VIII. created Hampton Court Forest, he was obliged to pay the freeholders for the lands of which he deprived them, and even Charles I. is said to have followed a like course when he created Richmond Park.

We have no means of determining the state of the law at the time of the Conquest. A series of enactments attributed to Canute is of such uncertain authority as to have been rejected by Coke in 1548, and Dr. Liebermann has recently shown that it is a forgery of about 1184. All that we know of his legislation on this subject is

that he permitted every man to hunt in his own wood, but forbade trespassing in the King's forest.

The terrible severities of the Norman period are usually said to have been introduced under Henry I., but in his charter of liberties Henry professes merely to retain the forests as his father had held them. His law claimed supreme jurisdiction over private forests as well as over his own, and prescribed terrible penalties for the killing of game, among which were death, blinding, and emasculation. The Assize of the Forest, issued by Henry II. in 1184, retains these punishments, but mitigates others and prescribes the limits of the jurisdiction of forest courts. The extreme rigor with which this otherwise just King enforced the forest law gave cause for great complaint. In the Great Charter John renounced his afforestments, promised reform of all bad customs, and excused from attendance on the forest courts those not living in the forest. The Charter of the Forests, issued by the Earl Marshal for Henry III. in 1217, was a still more liberal document, greatly diminishing the punishments, the severest of which is now imprisonment for a year and a day. Besides confirming the provisions of Magna Charta, it permits freemen to exercise many other rights, such as those to mills, fish-ponds, marl-pits, arable land, falcons, etc., on their own land, within the forest. Renewed by Edward I., and supplemented by another ordinance in 1306, it remained the basis of the forest laws of the kingdom.

In general, the inhabitants of the forest folds were subject to the royal rights of forestry. These were both of *vert*, that is, to every kind of tree and brush in the forest, and *venison*, that is to say, to every wild beast of the forest. They were not allowed to hunt or cut wood or brush on their own land without license of the royal official. They, indeed, retained some rights of pasture for *commonable* beasts (excluding sheep, goats, geese, and swine), but they might not use as much as would deprive the King's beasts of food.

The officers of the forest were numerous and important. The master forester seems to have been independent even of the justiciar. There were two justices in eyre, one for this side of Trent and the other for beyond. The verderers were chosen in pursuance of royal writ by the freeholders of the forest from their own number to maintain the law. Besides the foresters, who were freemen sworn to preserve *vert* and *venison* in their respective bailiwicks, there were other minor officials.

The forest courts were three in number, running parallel with the ordinary courts of justice. There was the *woodmote*, or court of attachments, held before the verderers every forty days. It tried minor trespasses only, and could not convict. The *swanmote* was held three times a year by the same officials, all freeholders of the forest being bound to attend. Presentments were made by a jury which tried and convicted, but did not pass judgment. This was reserved for the justices in eyre, who every third year held the *court of justice seat*, a supreme court of civil and criminal jurisdiction over all offenses committed in a forest, whether against the forest law or not.

The last important general forest legislation was passed by the Long Parliament in 1640.

Charles I. had been exacting fines for alleged encroachments on his forests, and Parliament replied with an act for the 'certainty of forests,' exempting from prosecution any alleged encroachments which were considered valid in the second year of James I. Since that act the laws of the forest have practically ceased. The Crown still retains ancient forestal rights over private lands in Dean Forest and in New Forest, but such rights survive as curious legal anomalies. During Queen Victoria's reign three of the royal forests, viz. Hainault, Whittlewood, and Wichwood, were disafforested by act of Parliament. It would be better, however, if the remainder, and particularly such as are near large cities, could be held as national parks and recreation grounds. This has recently been done in the case of Epping Forest near London, and seems to be the probable destiny of others as well.

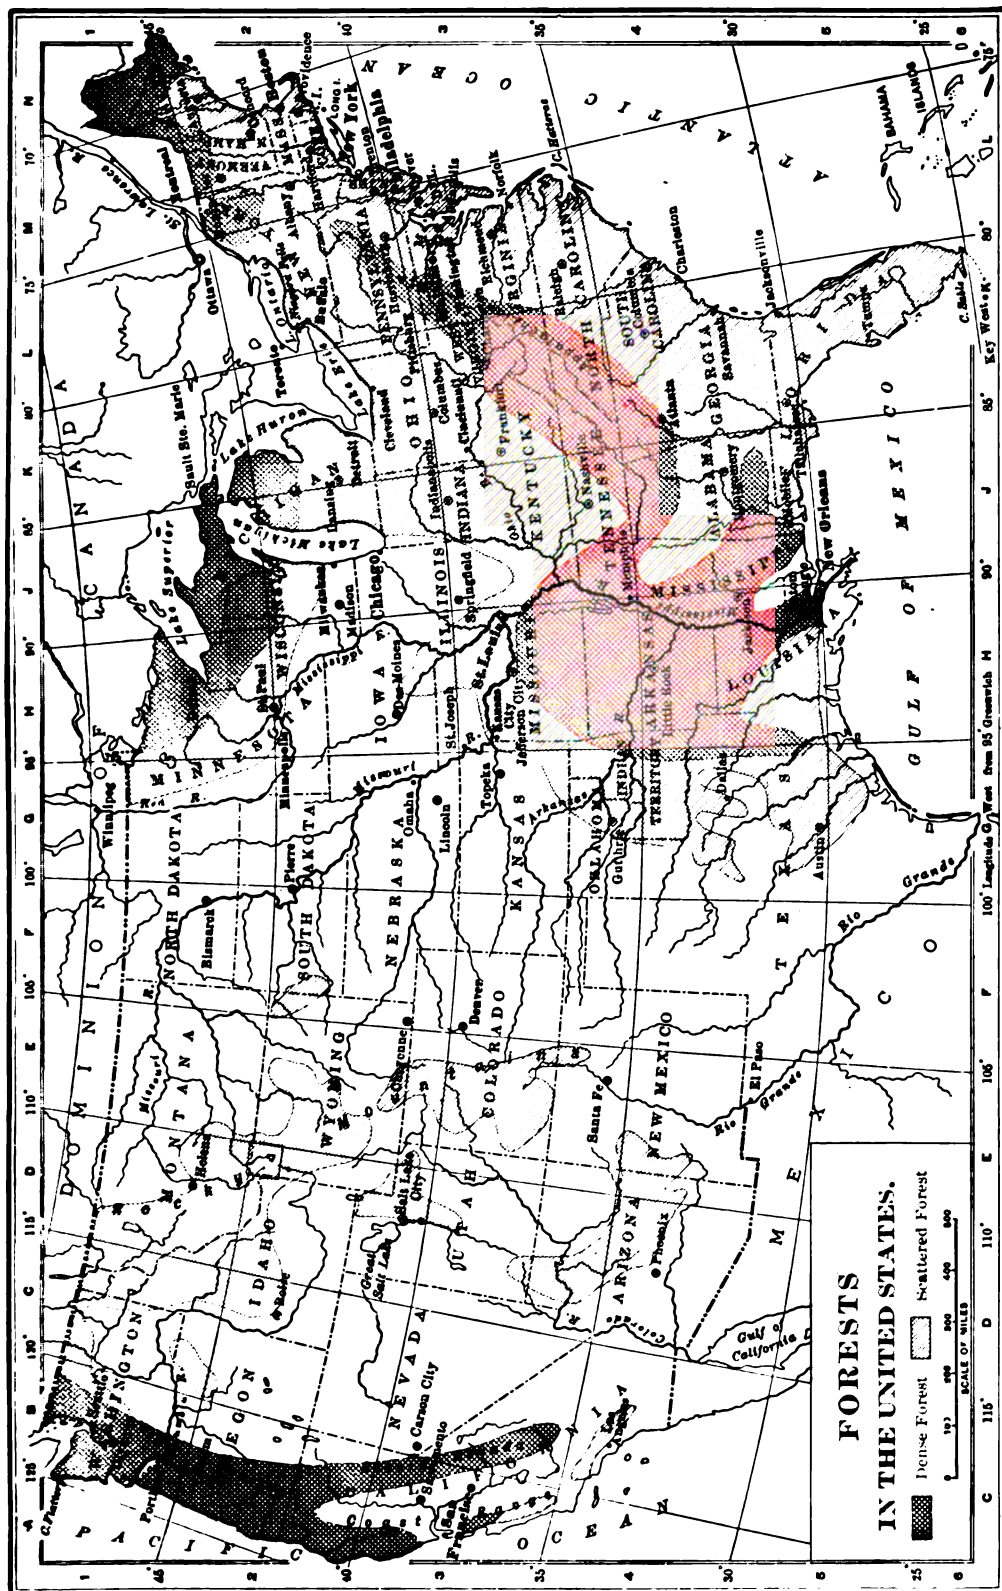

The royal forests of Scotland were nearly as numerous as those of England, and their area was larger in proportion to that of the country. As in England, there was a special code for them. Indeed, this code is so much like the English that it seems to have been derived from it. The penalties, however, are not so severe, nor did afforestation play such a prominent part in the Scotch constitutional struggle as in the English. The best edition of the Scotch forest code is in the *Acts of the Parliaments of Scotland* (Edinburgh, 1844).

BIBLIOGRAPHY. Most of the laws of the forest are given in convenient form by Stubbs, *Select Charters* (Oxford, 1895), as cited above; they are published in full in the *Statutes of the Realm*, Record Commission, vol. i. (1810); Coke's *Fourth Institute of the Laws of England* (London, 1548) is the earliest legal authority, and the most complete is Manwood's *Treatise of the Laws of the Forests* (London, 1598). For good brief modern descriptions, consult: Stubbs, *Constitutional History*, i. (Oxford, 1891); and "Forest Laws," in the *Encyclopædia of the Laws of England*, ed. by Ranton (London, 1895-98).

FOREST OAK. A name sometimes given in commerce to the timber of *Casuarina torulosa*, and other species of the same genus, all Australian trees. In Queensland the wood is considered as one of the most valuable for fuel, and is also split into shingles. It is light yellowish-brown and prettily marked with short red veins. It is exported for use in cabinet-work, for which purpose it is employed as veneer.

FOREST PRESERVATION. See FORESTRY; LUMBER INDUSTRY.

FORESTRY (from ML. *foresteria*, *forestaria*, *forestage*, from *foresta*, forest). The economic management of trees as communities. It is distinct from arboriculture, which is more strictly concerned with the individual tree. Forestry looks to the conservation and utilization of the various forest products in order that the greatest returns may be obtained. It may apply to the planting of a new forest or the preservation of an old one, the reforestation of a mountain-side, the prevention of ruthless forest destruction, or the utilization of the forest products as a crop. The uses of a forest are to supply timber, fuel, etc.; to offer protection against winds; to conserve moisture, by storing up water or at least by checking its loss by seepage and evaporation;

and to minister to the enjoyment of man in providing parks, game-covers, etc. In many new countries forests are considered detrimental to the growth of the varied interests upon which the new community is dependent, and they are removed as rapidly as possible. In old ones the lack of forests is keenly felt in various ways, and attempts have been made to restore, in part, the former wooded areas.

HISTORY. In some form, forestry has been practiced in Europe for several centuries. The growing scarcity of timber and fuel began to be felt in England early in the sixteenth century, and attempts were made to supply the failing resources by making new plantations and by more scientific cutting of the native growth. About the beginning of the eighteenth century plantings were begun in Scotland and later in Ireland; now the artificially planted areas exceed the natural ones. About this time there was great activity in the introduction of foreign species of forest trees, many of which were so well adapted to their new conditions that in places there are to-day more exotic than native trees. In France, Belgium, Germany, and other parts of Europe extensive areas of forests are now under systems of management that result in increasing rather than in decreasing production. Old native forests have been cared for, and denuded areas reforested. Governmental, communal, and private forests alike are so managed as to provide the various objects for which they were designed. In Germany and France the management of forests has received the greatest attention, and has been most systematically and scientifically conducted. Government schools are maintained for the education of skilled foresters, and special attention is paid this important subject.

FORESTRY IN THE UNITED STATES. Forest regulation did not for a time seem as necessary in the United States, with its great forest wealth, as in Europe. However, with the destructive methods of lumbering and the enormous waste by forest fires, the supply has been so encroached upon that means have been taken to repair the damage and to provide against its continuance. Various States have enacted laws designed to correct the former abuses by granting bounties for tree-planting and remission of taxes upon purely forest areas. The general Government has also attempted to aid by laws providing for the acquirement of land upon the condition of planting a portion to trees. Since the laws enacted by the general Government were improperly prepared, interpreted, and enforced, and have resulted in little good, they have been repealed. The greatest good has probably come from the reservation of extensive areas about the watersheds and sources of some great rivers. There were in 1899 36 forest reserves in the United States, embracing more than 46,000,000 acres. They are as follows: Grand Cañon, San Francisco, Black Mesa, and Prescott in Arizona; Pecos and Gila River in New Mexico; Stanislaus, Sierra Forest, Lake Tahoe, Pine Mountain, Zaca Lake, San Bernardino, San Gabriel, San Jacinto, and Trabuco Cañon in California; Battlement Mesa, Pike's Peak, Plum Creek, South Platte, and White River in Colorado; Fish Lake and Uintah in Utah; Bitter Root and Priest River, in Idaho; Bitter Root, Flathead, Lewis and Clark, and Gallatin, in Montana; Cascade, Bull Run, and Ashland, in Oregon; Black Hills, Teton, Yellow-

stone, and Big Horn, in South Dakota and Wyoming; and Priest River, Olympic, and Mount Rainier, in Washington. In addition there are a number of State reserves, the object of which is mainly to prevent the too rapid escape of water in floods, and the succeeding periods of scanty water-supply for irrigation and other uses. They are situated at the sources of water-supplies, and are patroled to insure their safety against marauders and fires.

FOREST TREES. Forests are of two kinds, pure and mixed. The former are less common than the latter, and are usually, though not always, composed of coniferous trees. One advantage of a pure forest is the greater ease in lumbering; one disadvantage is its liability to destruction by drought, insects, diseases, etc. Among species adapted to pure forests are pines, spruce, silver fir, Douglas fir, beech and maple. Those doing best in mixed woods are larch, birch, poplar, ash, oak, chestnut, and walnut. Mixed forests can be grown, and often are grown as a series of small colonies devoted to single species, but for general purposes mixed woods are most satisfactory. Since the requirements of different species differ as to light, moisture, and soil, the trees of mixed forests protect each other, and the forest floor, as the ground is called, better than those of pure forests.

REFORESTATION. Forests when once depleted are restocked in several ways. Although the setting out of young trees is one of the most expensive methods of restocking, it has been practiced to some extent in the plains region of the United States, and extensively in England. The seeds are sown and the young trees reared in nurseries where the peculiar requirements of the seedlings can be carefully met. After a growth of several seasons the trees are set in the places where they are to grow. Where the surface of the land will permit, they are often cultivated like any other crop until they attain a size sufficient to care for themselves. Frequently, too, crops of corn are grown in the spaces between the rows. While expensive, this method is best adapted to the conditions in the prairie region of the western United States. A second method is that of hand-seeding the region designed for the future forest. This method is followed in many places, but the difficulties of collecting and caring for the seed prior to seeding are so great as to make this method unsatisfactory. Natural seeding is largely depended upon to restock scientifically managed forests, occasional seed-bearing trees being left for the purpose. In some places the practice of thinning out the growth is followed to give the new stock of seedlings the air and light they require. Lastly, sprouts or suckers from the stumps and roots of trees that have been cut are often used for restocking. This method will apply only to such broad-leaved species as renew themselves in this way. They should be cut while dormant. This is about the only way employed in the reproduction of coppice woods. (See CORSE.) As a rule the conifers do not sprout from their stumps. Pruning and thinning must be given some attention. Natural pruning is most satisfactory, and will be done by the trees themselves if they are planted close enough. In natural pruning the lower twigs and branches die because close planting prevents their obtaining sufficient light. In time these dead parts are broken off and their stubs

are buried by the trunk as it increases in girth. Thinning, on the other hand, must be done from time to time so as to prevent overcrowding. When branches are cut off, the cut should be close to the main trunk, and where the wound is too large to heal over in a single year or possibly two, the cut surface should be protected against the entrance of fungi by painting it.

ECONOMIC RETURNS. The financial returns from forests depend upon a number of factors, but in any case they are tardy. In copses the whole area may be cut over every twenty or thirty years, while forests grown for timber must of necessity be of greater age. By conservative management, where the land is not too valuable at the beginning and markets are convenient, it is believed that four per cent. can be realized in European forests, and there are records of even greater returns in the United States. A ten-year-old plantation of hardy catalpa in Kansas is said to have yielded a net gain of \$197.55 per acre, which sum could have been increased by continuing the marketing over a longer period.

Since it has been shown that private holdings of forest areas can be so managed as to be a source of continual revenue without impairing the original capital, many large owners are availing themselves of the opportunity offered by the Government to secure the aid of expert foresters in planning their management. To provide experts schools of forestry have been established at Cornell and Yale universities, and forestry instruction is given in the agricultural colleges of a number of States.

CLIMATIC INFLUENCE. The climatic influences of forests are very great. Whether forests are actually instrumental in securing greater rainfall is somewhat problematical. Observations covering a long period of years and a large extent of forest are not sufficiently abundant to determine this point. That they do aid very materially in conserving moisture is not to be denied, and as a factor in the distribution of water they are equally important. In tempering hot and cold winds and as wind-breaks, they are of great importance. The temperature in a forest is lower in summer and warmer in winter than in an adjacent open tract, and this influence may be exerted to a considerable distance. The use of forests as a means for reclaiming tracts of almost barren sand and for protecting regions against wind-shifted sand are well shown by some of the forests of France.

FOREST ENEMIES. The worst enemies of forests are man, through the agency of destructive lumbering, forest fires, grazing of animals, especially sheep: insect attacks, and fungous diseases. Mixed forests are not so subject to great loss from the last two causes as pure woods, since the same fungus or insect seldom attacks any great number of species of trees. Public sentiment, knowledge of how to prevent the other losses, and how to make forestry profitable, must protect against the other enemies. See ARBORICULTURE; FOREST.

FORESTRY ASSOCIATION, AMERICAN. An association to further the conservation, correct management, and renewal of forests: to collect forest statistics, and to promote legislation for those ends. The excessive waste of forests in the United States, the destructive forest fires, and the no less destructive methods of cutting, led to the formation of the Forestry Association in 1875, in the hope of correcting these evils. The

association merged in 1882 with the American Forestry Congress, organized that year in Cincinnati, Ohio, and it was incorporated in 1897. The society has had the support of the Department of Agriculture of the Federal Government, and has coöperated with various State and local forestry associations. Annual meetings are held, at which papers are read covering all aspects of the forestry question, and the *Proceedings of the American Forestry Association* are published annually at Washington, D. C. *Forestry and Irrigation*, a monthly journal, is also published.

FOREY, fô'rá', ELIE FRÉDÉRIC (1804-72). A French soldier. He was born in Paris, was educated at Saint-Cyr, accompanied an expedition to Algeria in 1830, and in 1852 attained the rank of general of division. He was conspicuous in the Crimean War and in the Italian campaign of 1859, and in 1862 was sent to Mexico as military and civil administrator and Minister Plenipotentiary. He promised the Mexicans that their liberties should be preserved and their rights respected, but he nevertheless sequestered the goods of many of those who were opposed to Maximilian. Puebla surrendered on May 17, 1863, after a long siege. The City of Mexico was soon occupied, and a provisional government was formed. Forey was, however, replaced by Bazaine, became a marshal in the same year, and soon afterwards was given command of a corps d'armée.

FORFAIT, fôr'fá', PIERRE ALEXANDRE LAURENT (1752-1807). A French engineer, born at Rouen. In 1773 he was elected a member of the Academy of Rouen, in 1781 became an engineer in the French navy, and in 1787 was intrusted with the construction of packet-boats running between France and the French colonies, and to the United States. In 1791 he was elected from Seine-Inférieure to the Constituent Assembly. He was charged by Napoleon with the naval preparations for the invasion of Egypt, and from 1799 to 1801 was Minister of Marine and the Colonies. Subsequently he was appointed a councillor of State, and inspector-general of the fleet designed to be employed in the invasion of England. He was the inventor of the Seine boat, wrote many scientific papers, and published a *Traité élémentaire de la nature des vaisseaux* (1788).

FORFANG, or FOREFANG (Sax. *fore*, before, and *fangen*, to take). In old English law, the offense of buying up provisions, grain, etc., at a fair or market, before the King's purveyors were served with necessities for his Majesty. It is denounced in a charter of Henry I. in 1133, but has long been obsolete. The term *forfang* was also used in Anglo-Saxon law to describe the lawful recovery, by force and arms, of stolen or strayed cattle from a thief, or from those having illegal possession of them, as well as the reward fixed for such rescue.

FORFAR, fôr'fär. The county-town of Forfarshire, Scotland, a Parliamentary and royal burgh situated in the Vale of Strathmore, 14 miles north-northeast of Dundee (Map: Scotland, F 3). The Scottish Midland Junction Railway connects it with Aberdeen. Linen is its staple manufacture. Supposed to be the ancient *Orrea*, it was once the seat of the Scottish kings. David I. (1124-53) made it a royal burgh. In 1308 Bruce destroyed the castle, and according to

Boece, Forfar by 1526 had dwindled to 'a country village.' Since the middle of the eighteenth century it has grown into a prosperous town. Population, in 1891, 12,844; in 1901, 12,061. In the neighborhood is Glamis Castle, the seat of the Earl of Strathmore.

FORFARSHIRE, or ANGUS. A maritime county in the East-Midland Division of Scotland, bounded east by the North Sea, north by Kincardineshire and Aberdeenshire, west by Perthshire, and south by the Firth of Tay (Map: Scotland, F 3). Area, 875 square miles. The surface of the county is irregular, and intersected with hills, the Sidlaw being 1400 feet high, and Catlaw, the highest, 2264 feet. The chief rivers are the Tay, North Esk, South Esk, and Isla. Forfarshire is an agricultural county, and also the chief seat of Scotch linen manufactures. Capital, Forfar; other important towns are Dundee, Montrose, and Brechin. Population, in 1801, 99,000; in 1851, 191,260; in 1901, 284,000. Consult Warden, *Angus or Forfarshire* (4 vols., Edinburgh, 1880-83).

FORFEITURE. The loss of title to property, as a punishment for crime or other unlawful act. Personal as well as real property is subject to forfeiture, and the penalty may be incurred for civil as well as for criminal offenses. The forfeiture of lands was a penalty of the feudal law, and was a direct consequence of the feudal relation of landlord and tenant. This relation was primarily personal and confidential, the lord owing protection to his vassal, and the vassal being bound to the highest degree of loyalty and devotion to his lord. As it was this feudal relation of interdependence which made the vassal a legal person (*homo legalis*)—i.e. a member of society protected by the political organization of the State and its machinery of justice—so the rupture of this feudal relation by any disloyalty operated at once to render the tenant a man without law, a lawless man, or outlaw. As he held his lands, his goods, and even his life on the condition of loyalty to this feudal bond, its breach naturally involved the forfeiture of these.

FORFEITURE FOR CRIME. The penalty of forfeiture for treason prevailed in England before the Conquest, as is clear from the fact that lands held in gavelkind, which is a Saxon tenure, may be forfeited for treason. But after the Conquest forfeiture of lands and goods came to be regarded as the peculiar punishment of felony, of which treason against the sovereign was the highest kind, and was denominated high treason, to distinguish it from all other felonies, which were called petty treason. In cases of treason the offender forfeits all his lands absolutely to the Crown. Upon conviction of felony, according to the old law, the offender forfeited to the Crown the profits of all estates of freehold during his life, and all his estates in fee simple for a year and a day, after which they became escheat to the lord. The Crown, during the year of occupancy, was entitled to commit upon the lands what waste (q.v.) it pleased. By Magna Charta this power of committing waste was restrained. But by 17 Edw. II., c. 16, the King's right to waste was again recognized. In all felonies the goods and chattels of the offender are, on conviction, forfeited to the Crown; but until conviction forfeiture of the goods does not operate. Where, therefore, a person has disposed of his

goods before conviction, the Crown cannot reach them. Forfeiture of lands does not take effect until sentence of attainder (q.v.) has been pronounced. So that a person committing *felo de se* (q.v.), or a rebel dying before sentence, or killed in open rebellion, does not forfeit his lands. But sentence of attainder, as soon as pronounced, has a retroactive effect, and annuls all conveyances made between the act of treason or felony and the pronouncing of sentence. Conveyances made before the act of treason are not affected. Hence, a wife's jointure is not forfeited, because settled on her before the commission of the act. The same thing is true of the wife's dower in all lands of which her husband was seized prior to the commission of the treasonable acts charged.

Forfeiture for treason and felony is accompanied by *corruption of blood*, whereby the offender is incapable of inheriting any lands or of transmitting any title to an heir. It was this doctrine which produced the escheat of forfeited lands, to which reference has been made above. The tenant, having been cut off by his crime from all human relationships, his blood being corrupted—i.e. bastardized and rendered illegal—by the attainder, has no lawful heirs to whom the lands can descend, and there being thus a failure of heirs, the land escheats to the lord of whom it is held. (See *ESCHEAT*.) By 7 Anne, c. 21, it was enacted that after the death of the Pretender and his sons no attainder for treason should operate to the prejudice of other than the offender himself; but this provision was repealed (39 Geo. III., c. 93). In 1870, however, the Crown's claim of forfeiture was abolished in all cases but outlawry (Forfeiture Act, 33 and 34 Vict., c. 23, § 1), and in 1879 (42 and 43 Vict., c. 59, § 3) outlawry in civil cases was also abolished.

In the United States conviction of felony has never been attended with forfeiture, and the penalty of forfeiture for treason is confined within narrow limits by the Federal and State constitutions. See *ATTAINDER*.

CIVIL FORFEITURE. Civil forfeiture may be incurred in England in five ways—viz. by tortious alienation, by wrongful disclaimer, by alienation in mortmain, by breach of condition, and by the commission of waste. The first three of these modes were incidents of the feudal tenure of lands; the last two were introduced by statute. It must be observed that, according to the earliest feudal customs, a gift of lands was always made in favor of a particular person, and that alienation, without consent of the overlord, involved a forfeiture of the fee. But this strictness having by degrees ceased to be observed, forfeiture was only incurred in case of a tortious alienation. Tortious alienation was where the owner of a particular estate conveyed by common-law conveyance, as feoffment, fine, or recovery, a greater estate than that to which he was himself entitled, as where a tenant for life made a feoffment in fee. The immediate effect of this act was the forfeiture of the land to the remainderman or reversioner. By 3 and 4 Will. IV., c. 74, abolishing fines and recoveries, and 8 and 9 Vict., c. 106, § 4, declaring that feoffment should not have a tortious operation, forfeiture by tortious alienation has ceased to have practical importance. (See *FEOFFMENT*.) Forfeiture by wrongful disclaimer was where a tenant holding

of a superior lord, on being summoned in any court of record, either disclaimed his allegiance or did any act which amounted to a disclaimer. Since the abolition by the statute *quia emptores*, or subinfeudation, this species of forfeiture can only arise in lands held of the Crown. Forfeiture by alienation in mortmain is incurred by the conveyance of lands or tenements in favor of any corporation (q.v.), sole or aggregate, ecclesiastical or temporal. As by vesting the land in a tenant of this description the overlord was deprived of all the duties and services due by his vassal, this act was declared by various acts of Parliament to involve the forfeiture of the lands. (See MORTMAIN.) Forfeiture of copyholds was incurred by committing waste, and by other acts of a wrongful kind inconsistent with the fealty due to the lord. By the statutes of Marlborough (52 Hen. III., 1267) and Gloucester (6 Edw. I., 1278), the penalty of forfeiture was affixed to the commission of waste by any tenants for life or for years, as well as by guardians in chivalry. (See WASTE.) Forfeiture on breach of condition subsequent is where an estate is held upon a condition contained in the grant itself. On failure of the condition the grantor or his heirs may enter upon the lands. See CONDITION; ENTRY, RIGHT OF.

In Scotland civil forfeiture may arise either from statutory enactment, at common law, or by agreement. By a statute of 1597 it was enacted that vassals failing to pay their feu duties for two years should forfeit their right. This forfeiture must be established by an action to recover the feu duties in arrear, and might be avoided by payment at the bar. At common law, a vassal forfeited his land by disclamation or purpresture. The former is analogous to the English disclaimer, and consists in the denial by a vassal of his lawful superior. Purpresture was incurred by the vassal's encroachment on the streets, highways, or commonalties belonging to the Crown or other superior. These forms of forfeiture are fallen into disuse. Forfeiture on special agreement depends wholly upon the terms of the condition inserted in the titles. See FEE; FEUDALISM; LIEUTANCY; TENURE.

In the United States civil forfeiture is generally limited to acts of waste committed by tenants for life or years, and to the breach of conditions upon which lands are granted, and in a few States even these have been abolished. But there are certain offenses in regard to which particular statutes have been enacted by Congress exacting the forfeiture of property employed as a means of committing the wrongful act or used in an unlawful transaction; but forfeiture in such cases applies only to the particular property designated, and not generally to chattels or lands, as in the other instances which have been maintained. Thus, laws have been passed from time to time providing that smuggling or importation of goods under fraudulent invoices shall cause a forfeiture either of the entire invoice or of the property wrongfully imported. Acts of piracy entail a forfeiture of the piratical craft and its appurtenances. The same was true of vessels engaged in the slave trade.

FORGÁCH, or **FORGÁCS**, fôr'gách. A noble family of Hungary, which traces its origin to the time of King Stephen. FRANCIS FORGÁCH (1510-75) was Bishop of Grosswardein (1556-67). He

took part in the Council of Trent. He afterwards traveled to Italy and wrote, *Rerum Hungaricum Sui Temporis Commentarii Libri XXII.*, 1540-1572, republished in 1866 by Major in the *Monumenta Hungariae Historica*. The more recent members of the family include: Count IGNATIUS FORGÁCH (1702-72), a general under Maria Theresa, and Count ANTON FORGÁCH (1819-85), who held several offices under Ferdinand and Francis Joseph. From 1861 to 1864 he was High Chancellor, and was a staunch supporter of the old Conservative Party. After 1869 he was Deputy in the Hungarian Diet.

FORGE, FORGING (from OF. *forge*, from Lat. *fabrica*, workshop, from *faber*, smith). A forge is a furnace or open fire, commonly fitted with a bellows or air-blast, for heating metal which is to be formed into special shapes by forging; forging is the process of hammering or pressing hot metal into special shapes for use in engineering and the arts. Forges are made in all sizes, from the miniature gas-heating device used by jewelers to the great furnaces for heating steel ingots, armor-plates, engine-shafts, etc., weighing many tons; and they may be either fixed or portable. Portable forges are usually constructed of metal, and are of small size; they comprise a shallow pan or hearth for the fire, a bellows or fan for blowing the fire, and the hand or power mechanism for operating the blast-producing device. Fixed forges are usually built of masonry with an interior lining of fire-brick or other refractory material, and the blast is produced by power blowers.

Originally forging was a hammering process solely, but recently forging by presses has come into use, especially for making heavy forgings of steel. Forging by hammering may be done either by hand or by power. Hand hammering or forging is usually confined to the production of small forgings or to finishing large forgings produced by power hammers. The process is a simple one, and is familiar to any one who has observed a blacksmith fashioning horse-shoes or similar small articles. Power forging by hammers is nothing more than the hand-hammering process accomplished by means of heavy hammers operated by steam or other power. (See HAMMER.) It is employed in the production of large forgings for engines and machinery. Forging by presses consists in substituting for the power hammer, with its sudden heavy blow, a hydraulic press which squeezes the metal into shape by a comparatively slow, steady pressure. Steel forgings for engine-shafts, armor-plates, etc., are usually made by pressing. The process may be illustrated by tracing the operations conducted in forging a modern hollow steamship shaft. An ingot of open-hearth steel of proper chemical composition to give the necessary physical properties is cast approximately twice the size of the finished shaft. The metal is then submitted, while liquid, to hydraulic pressure of 7000 tons, or thereabouts, until cold, great care being taken to cool the ingot slowly and equally on all sides to prevent strains or cracks from forming on account of unequal contraction. When the ingot is cold, the sand from the mold which has adhered to it is cleaned off, and then, if intended for a small shaft, it is ready for the forging process proper. If the shaft is to be of more than 12 or

14 inches in diameter, a hole is bored through the axis of the ingot. The size of this hole varies according to the size of the shaft and the service to which it is to be eventually subjected. Generally speaking, however, it is made from one-third to two-fifths the diameter of the finished shaft. The first operation in the process of forging is the reheating of the ingot. This is a very delicate operation. Great care must be taken to insure a slow and uniform penetration of the metal by the heat, as there is, otherwise, danger of expanding the surface metal so rapidly that it will crack away from that underneath, which has not been heated to the same temperature. The hole in the centre of large ingots allows the interior and exterior to heat up and expand together, thus relieving this tendency to crack. When the ingot is heated, it is forged into shape under a slow-moving hydraulic press of from 2000 to 5000 tons capacity instead of the rapid steam hammer of from 5 to 25 tons falling weight. In the case of the hollow ingot, a steel mandrel is inserted, of a size to fit loosely into the hole, and the metal is forged down in the same manner as is employed with a solid shaft. Generally the shaft, if very long, has to be reheated one or more times during the forging. The finishing process consists in annealing or tempering the shaft, when it is ready to be machined.

Many small articles of common use are forged by machinery. Balls, screw and rivet blanks, nuts, nails, etc., are among the more familiar machine-forged articles. In general the process consists in inserting steel bars, heated to the proper temperature and of suitable cross-section, into a machine automatically operating, which cuts off the proper lengths and stamps or presses it into shape between dies. The process is a continuous one, one heated rod being inserted after another as fast as the machine will handle them. Many articles of intricate pattern are drop-forged. In this process an upper and lower die are employed. The lower die is placed on the anvil of a drop-hammer, the heated piece of metal placed on it, and the upper die placed on top of the heated metal. A hammer falling from a height strikes the upper die, and thus stamps the plastic metal into shape between the dies. Drop-hammers are made of various sizes; the largest now in operation has a 3000-pound hammer.

FORGERY (Fr. *forger*, to form metal into shape, to fabricate). The *crimen falsi* of the Roman law is held in English common law to be the fraudulent making or altering of a writing or seal, to the prejudice of another man's right, or of a stamp to the prejudice of the revenue. As regards writings, the instrument forged must be executed with such skill or in such circumstances as to be capable of being mistaken for a genuine document by a person of ordinary intelligence and observation. It is not necessary that there should be even an attempt at imitation. If there was intention to deceive, and the circumstances were such as to render deception possible, the crime has been committed, and consequently it is possible to forge the name of a person who cannot write. Any material alteration, however slight, is a forgery just as much as the subscription of the name of the pretended maker, or the fabrication of the entire writing. It will not lessen the crime, though the whole writing should be genuine, the name only being forged, or the name being really the hand-

writing of the party to whom it belongs, but appended to a forged writing. Even if the name be a fictitious one, but appended for the purpose of deceiving, a forgery has been committed just as much as if it belonged to a real person. The offense is not limited to the fabrication of writings, using that term in its literal sense. It includes the fabrication of printed or engraved instruments, such as railroad tickets, corporation certificates, bonds, etc. Falsely painting an artist's name on a picture is not forgery, however, for the picture is not a document or writing. Moreover, the document fabricated must have an apparent legal efficacy. A letter of introduction, though requesting a personal favor for the bearer from the one to whom it is addressed, is not a subject of criminal forgery, as it does not purport to confer any legal right or to impose any legal duty. At common law forgery is a misdemeanor, punishable by fine and imprisonment, or both.

To secure a conviction for forgery it is necessary to prove an intent to defraud, but it is not necessary that the purpose should have been actually effected; it is sufficient to show that the forgery would have proved injurious to another's interests. The different State laws in this country generally define specific offenses as constituting the crime of forgery, but these laws do not interfere with the character of the offense at common law, but simply provide a special and increased punishment in such cases as they particularly enumerate. Consult: Stephen, *History of the Criminal Law of England* (London, 1883); and the bibliography under **CRIMINAL LAW**.

FORGET-ME-NOT (*Myosotis*). A genus of, annual or biennial herbs of the order Boraginæ with small, generally blue flowers. The genus is distributed over the temperate zones in all quarters of the world, and a number of species are common in America, growing chiefly in ditches and damp meadows. *Myosotis palustris* and the closely related *Myosotis laxa* have crooked, creeping perennial roots, an angular stem one to two feet in height, and calyx covered with appressed bristles. *Myosotis sylvatica*, with calyx covered with stiff spreading hairs, grows in bushy places and woods, and is often planted in flower-gardens. It is especially admired for the size and brilliancy of its flowers. The dark-blue forget-me-not of the Azores (*Myosotis Azorica*) is cultivated in Europe, but requires the greenhouse. The genus is a favorite with most persons, both because of the brilliancy of the flowers, and because it is generally regarded as the emblem of friendship. The English name, scorpion grass, is now seldom heard. The German name, *Vergissmeinnicht*, corresponds with the English forget-me-not. *Myosotis versicolor*, very common in Great Britain, often as a weed in gardens, is remarkable for the change of color in the very small flowers, which are first yellow, then blue. Some species occur in such great abundance in parts of Alaska as to color the hillsides. *Myosotis verna* is rather abundant in dry places of the eastern United States during May and June.

FORKBEARD (so called from the apparent bifurcation of the ventral fins). A British hake (*Phycis blennoides*), also called hake's dame (q.v.), the ventral fins of which are long and filamentous.

FORK'EL, JOHANN NIKOLAUS (1749-1818). A German writer on music. He was born at Meeder, Saxe-Coburg, was organist to the University Church in Göttingen, and later director of

music at the university. Though he acquired considerable reputation as organist and harpist, his chief interests were the theory and the history of music. Noteworthy is his *Allgemeine Geschichte der Musik* (2 vols., 1788-1801).

FORKS (AS. *fora*, Icel. *forkr*, OHG. *furka*, Ger. *Furke*, from Lat. *furca*, fork). Forks, as table instruments, are only about three centuries old. The Greeks, Romans, and other ancient nations knew nothing of them. In ancient times, as is the practice still in the East, meat was commonly prepared in stews; or, if roasted, it was cut into small pieces by a carver so as to be easily taken in mouthfuls by the guests, who used their fingers and a knife for the purpose. The use of any species of forks at table was quite unknown till the fifteenth century, and then only in Italy. None of the sovereigns of England had forks till after the reign of Henry VIII., all persons, high and low, using their fingers. The first royal personage in England known to have had a fork was Queen Elizabeth; but, although several were presented to her, it is doubtful whether she ordinarily used them.

In England forks were employed only by the highest classes at the middle of the seventeenth century. About the period of the Revolution of 1688, few noblemen had more than a dozen forks of silver, along with a few of iron or steel. At length, for general use, steel forks were manufactured at Sheffield. They had at first but two prongs, and it was only in later times that the three-pronged kind was made. As late as the early part of the eighteenth century table-forks were kept on so meagre a scale by country inns in Scotland (and perhaps also in some parts of England) that it was customary for gentlemen in traveling to carry with them a portable knife and fork in a case. The general introduction of silver forks into Great Britain is comparatively recent; it cannot be dated before the opening of the Continent to English tourists in 1814.

FORKTAIL. A name applied to various birds having noticeably forked tails, as the scissor-tailed fly-catcher (see Plate of **FLY-CATCHERS**) or a kite. Specifically it denotes a group of small black-and-white insectivorous birds of mountainous regions from Northern India to Borneo, which have long forked tails kept incessantly in motion. They constitute the genus *Henicurus*, and place their nests beside a stone or log, near the edge of small streams.

FORLÌ, fôr-lê'. The capital of the Province of Forlì, in Central Italy, on the right bank of the Montone, 40 miles southeast of Bologna (Map: Italy, G 3). In the churches of Santi Biagio e Girolamo and San Mercuriale, named after the first Bishop of Forlì, are paintings by Palmezzano and others. The imposing Cathedral of Santa Croce has been almost entirely rebuilt since 1844. In the Church of San Pellegrino is a fine fifteenth-century tomb. The collection of paintings in the municipal Pinacoteca is important. The citadel, built in 1361 by Cardinal Albornoz, is now used as a prison. Forlì has a lyceum, a seminary, a technical institute, a library, and a hospital (founded in 1636). It markets grain, wine, cattle, silk, and hemp, and manufactures machinery, pottery, and furniture. The ancient Forum Livii is said to have been founded by and named after Livius Salinator, in B.C. 207, after his victory over Hasdrubal. Early

in the Middle Ages it was part of the Exarchate of Ravenna, changed masters during the struggles of Guelphs and Ghibellines, and was annexed to the Papal States in 1512 by Julius II. Population, in 1881, 41,000; in 1901, 43,708.

FORLÌ, MELOZZO DA (c. 1438-94). An Italian painter, born at Forlì. He was a pupil of Annino da Forlì, but was more influenced by Mantegna, and especially by Piero della Francesca, who was then at the height of his fame, and of whom he may once have been a pupil. Melozzo was introduced to the notice of Pope Sixtus IV., and became a favorite painter. For this Pope and his nephew, Cardinal Riario, he executed his two great frescoes, "An Audience of Sixtus IV.," for the Vatican Library, and an "Ascension," for the Church of the Santi Apostoli. The first of these has been transferred to canvas, and is in the Vatican Picture Gallery; the latter is in fragments, some of which are in the Quirinal. The angel musicians in the sacristy of Saint Peter's are among the most exquisite examples of early Italian art. The whole work shows that Melozzo understood foreshortening, a part of perspective then little studied. In 1480 he returned to Forlì, and not long afterwards entered the service of Federigo da Montefeltro at Urbino, and executed the "Personification of the Arts and the Sciences" for the ducal library. This fresco is also in fragments. Both Berlin and London possess portions of it. Many paintings are now doubtfully attributed to him. Consult Schmarzow, *Melozzo da Forlì* (Stuttgart, 1886).

FORM (Lat. *forma*, shape). In botany, the unit of ecology, as the species is the unit of classification or taxonomy. The term is often used in expressions such as 'life form,' 'plant form,' etc. See **ECOLOGY**; **TAXONOMY**.

FORM. In music, that element which unites all the various parts into an harmonious whole. It is essential that these various parts should have some intimate relation to one another, otherwise they could only be loosely strung together, and could never represent artistic unity. Musical unity is attained by various means, such as the repetition of musical motives or phrases, the maintaining of a certain rhythm or figuration, the choice of a fixed tonality. Dissonant or contrasting elements are not excluded, but they must be resolved into a higher unity. The germ of all musical form is the two-measure motive or *section*. A combination of two sections forms a *phrase*, of two phrases a *period*. The first two phrases constitute the *antecedent*, the last two the *consequent*. This is shown by the example (1) from Beethoven on the following page. To this period Beethoven adds another one (2) similarly constructed, and standing to the first in the relation of consequent to antecedent. These two periods together constitute what is known as the simple *Liedform*. Symmetry is one of the most essential features of all musical works, and a composition is unintelligible unless its themes are so arranged that the architectonic structure of the whole presents perfect symmetry. The three fundamental forms are the liedform, sonata-form, and rondo-form. The grouping of the themes in these forms is:

I. Liedform. A—B—A.

II. Sonata-form [:A (key of tonic); B (key of dominant):]— $\frac{A}{B}$ —A—B (in key of tonic).

III. Rondo-form (a) with two themes; A—B—A (in key of B); B (in key of A)—A; (b) with three themes A—B—A—C—A—B—A. The second and third time A appears in keys different from the original.

These forms admit of considerable variety, and the great masters, especially Beethoven, have been inexhaustible in ingenious combinations of themes. No definite rules can be laid down in this respect; anything is permissible that does not destroy the symmetry of the whole. In cyclical compositions symmetry between the various movements is maintained by the proportion of the various movements to one another, the relation of their keys, the alternation of slow and fast tempo, and sometimes also the introduction of a theme from a previous movement (Beethoven, Symphony No. 9). See CYCLICAL FORMS.

Instrumental forms were originally developed from simple vocal forms. Their development has been the slow product of centuries. Simple dances were united in the suite (q.v.), which gradually developed and evolved the sonata. From the stringing together of madrigals arose the original *dramma per musica*, which became the *opera* (q.v.) and culminated in the *musical drama* (q.v.). For a careful study of musical forms consult Lavignac, *Music and Musicians*, translated from the French by Marchant, with additions by Krehbiel (New York, 1898).

FORM. In philosophy, a term used by Plato (Gk. *ἵδεα*, *εἶδος*) to express the reality of a thing; that which makes it what it is, and which is permanent; in contrast with appearances and objects of sensation that pass away and are altered as they pass. The metaphysical character of Plato's forms, or ideas, has been the subject of much dispute, the question being whether Plato conceived them as having an existence in independence of the world of sense, or whether they were not for Plato very much what laws of nature are for the modern scientist. Aristotle gave the authority of his great name to the former interpretation, which has thus become traditional. Aristotle himself used the word *form* as expressing the essence of a thing, and this meaning became current in scholasticism especially in the expression 'essential form.' Bacon used the word *forms* in the sense of "the laws and modes of action which regulate and constitute any simple nature, such as heat, light, weight, in all kinds of matter susceptible of them; so that the form of heat and the law of heat, or the form of light and the law of light, are the same thing." But Bacon did not succeed in keeping it free from scholastic connotation, even in his own use of the word. Kant used the

term in the sense of a framework, supplied by the nature of the mind in its percipient character; within this framework the materials of sense are organized by the action of thought. Kant recognized two such forms, *space* and *time*. In this sense, form is subjective, i.e. it is not a characteristic belonging to an object as it is in its own intimate nature, but only as it appears in experience. Hegel pointed out the impossibility of thus separating the objective and the subjective, and used form in the sense of the total effect of a unity of distinctions.

FORMALDEHYDE, H.CHO. A compound of carbon, hydrogen, and oxygen—the simplest of the class of aldehydes (q.v.). It is obtained by the oxidation of wood alcohol. Dry air, saturated with the vapor of wood alcohol, is passed over a superficially oxidized spiral of copper gauze, inclosed in a long glass tube. The products of the reaction—the vapors of formaldehyde and water—pass out of the glass tube into empty receivers, in which the water vapor condenses to liquid water, and the latter dissolves much of the formaldehyde vapor, the result being a 35-per cent. solution of formaldehyde in water. Such formaldehyde as passes unabsorbed through these receivers is taken up in water, forming more—this time weaker—aqueous formaldehyde.

Attempts to condense formaldehyde vapor alone, without water, have invariably failed, the isolated compound undergoing chemical transformations with great rapidity. Formaldehyde solutions, known commercially under the name of *formalin*, are used as antiseptics and disinfectants, in the manufacture of certain dyes, etc. Subcutaneous injections of formalin have been proposed as a remedy for septicæmia, but the possible value of the drug is more than counterbalanced by its highly poisonous nature. In this connection it may be interesting to note that, while formaldehyde itself is poisonous, its compound with acid sodium sulphite, $\text{CH}_2(\text{OH})\text{SO}_3\text{Na}$, whose properties resemble to some extent those of formaldehyde itself, is harmless. With ammonia formaldehyde reacts to form a compound known as hexamethylene-amine, $(\text{CH}_2)_6\text{N}_4$. This reaction permits of determining analytically the amount of formaldehyde in a given solution.

Formaldehyde has formed the starting-point in the modern synthetic work on the sugars (q.v.). If allowed to stand for some time in the presence of weak alkalies, it is transformed into a mixture of simple sugars known as "formose" and including ordinary fructose ("levulose"). It is possible that in the transformation by plants of atmospheric carbonic acid into complex carbohydrates, such as the sugars and

starch, the production of formaldehyde is the first step. Formaldehyde itself has never been found in plants, and would probably kill them if produced in considerable quantities. Possibly every trace of formaldehyde undergoes chemical change as soon as formed. See FORMIC ACID.

FORM'ALIN. See FORMALDEHYDE.

FOR'MAN, HARRY BUXTON (1842—). An English author, born in London. He entered the civil service in 1860, and became assistant secretary in the general post-office and comptroller of packet services. Known for his essays and his editions of Shelley (1876-80) and Keats (1883), he has also published *The Letters of Keats to Fanny Browne* (1878); *The Shelley Library* (1886); *E. B. Browning and Her Scarcer Books* (1896); and *The Books of William Morris* (1897).

FORMAN, SIMON (1552-1611). A notorious English astrologer and quack doctor. He claimed to have discovered his marvelous powers in 1579, and thereafter practiced as a quack. Strangely enough, he received later (1603) the degree M.D. from Jesus College, Cambridge. At this time he was engaged in a most scandalous practice among the ladies at Court, with love philtres and wax images. Besides his *Grounds of the Longitude* (1591), he left behind him a mass of manuscripts, small parts of which have been published, as the *Diary* from 1564 to 1602 (J. O. Halliwell-Phillipps, 1843), and extracts from the *Book of Plays* (Halliwell-Phillipps, Folio Shakespeare, 1853-65), giving the dates of performances at the Globe Theatre of *Macbeth* (April 20, 1610) and *Winter's Tale* (May 15, 1611).

FORMA PAUPERIS, IN (Lat., in the character of a poor person). The phrase usually employed in both England and America when a person arranges to conduct an action in such a way as to avoid certain expenses because too poor to sue in the ordinary way. In England, the statutes 11 Hen. VII., c. 12, and 23 Hen. VIII., c. 15, provide that such as will swear themselves not worth £5 except their wearing apparel and the matter in question in the cause, shall be exempt when plaintiffs, but not when defendants, from the payment of court fees, and shall be entitled to have counsel and attorney assigned to them by the court without fee. They are further excused from costs when unsuccessful; a privilege which, according to Blackstone, amounted in former times only to the rather uncomfortable alternative of choosing between paying and being whipped. In the event of success, however, a person suing in this form is entitled to his costs, because his counsel and agent, and the officers of court, though they are bound to give their labor gratis to him, are not bound to give it on the same terms to his antagonist, unless he too be a pauper. To prevent the abuse of suing in the superior courts at Westminster in this form in matters of small amount, it is provided (19 and 20 Vict., c. 108, § 30), subject to certain exceptions, that any plaintiff who resorts to one of these, in a case falling within the cognizance of a county court, and recovers no more than £20, or in some cases £5, shall have no costs, unless he satisfies the court or a judge that he had sufficient reason for taking that course.

In Scotland this benevolent arrangement was introduced by statute more than half a century before the date of the English act above mentioned.

Similarly, actions *in forma pauperis* may be

prosecuted in all of the United States. The provision is deemed a part of the common law of the several States, derived from the English system of administering justice, though it is now in many States governed by statute.

FORMATION (Lat. *formatio*, from *formare*, to shape, from *forma*, shape). In botany, a widespread assemblage of plants with similar life relations, whose presence is determined by climatic factors—e.g. one may speak of desert formations, or tropical evergreen forest formations. A second use of the word applies to an assemblage of similar plant societies (see SOCIETY); e.g. all the peat-bog societies of a region taken as a whole make up the peat-bog formation of that region. The word formation is also used as the equivalent of society; in this case the formation first described would be called climatic, in contrast to the edaphic formation or plant society. See ECOLOGY; DISTRIBUTION OF PLANTS.

FORMATION. In geology, a group of strata united by some common characteristic, such as age, origin, or composition. It is loosely employed, and may be synonymous with any of the stratigraphic divisions—e.g. coal formation (Carboniferous system), Canadian formation (Canadian series), etc.

FORMA UR'BIS (Lat., shape of the city). A famous map of Rome engraved on marble and affixed to the outer wall of the Templum Sacre Urbis (now the Church of SS. Cosma e Damiano). The fragments were discovered under Pius IV., during excavations back of the church, but were carelessly kept, and some were again found in 1888, having been used to repair a garden wall. Other portions were found from 1867 to 1884, near the church, and all the fragments are now in the Capitoline Museum. The map represents the plan of the city as reconstructed under Severus and Caracalla, after the fire of Commodus, and replaced a previous map made under Vespasian and preserved in the Templum Sacre Urbis, facing the Forum Pacis.

FORMEDON. An ancient form of action, in the law of England, belonging to the class of real actions, whereby the heir in tail, or the reversioner or remainderman who had been ousted by a discontinuance, was entitled to vindicate his claim to the lands from which he had been ousted. By 21 James I., c. 16, it was enacted that writs of formedon should be brought within twenty years after the cause of action arose. The writ of formedon is now abolished.

FORMENTERA, fôr'mân-tâ'râ. One of the Balearic Islands, in the western part of the Mediterranean (Map: Spain, F 3). It is a part of the Spanish Province of Baleares. The island has an area of 35 square miles, and a population, in 1900, of 2295. Wheat is chiefly grown. Formentera was taken by Aragon in 1232.

FORMER AGE, THE. A poem by Chaucer, a metrical version of part of his translation of Boethius. It was discovered by Bradshaw, and published by Morris in 1866.

FORMES, fôr'mēs, KARL JOSEPH (1816-89). A German-American opera singer, born at Mülheim-on-the-Rhine. He had a remarkably sonorous bass voice and considerable dramatic talent, his début at Cologne (1841), as Sarastro, in the *Magic Flute*, at once establishing his fame.

Other important European engagements were: Mannheim, 1843-48; Royal Italian Opera, London, 1852-57. Afterwards he visited the United States, where, with the exception of an occasional visit to Europe, he spent the remainder of his life. The parts of Falstaff in the *Merry Wives of Windsor*, and Plunkett in *Martha*, are said to have been written for him. He was enthusiastically received throughout the United States, and especially in New York. He died in San Francisco. His brother, THEODOR FORMES (1826-74), was trained as an operatic tenor, made a successful debut at Buda in 1846, and, after several important European engagements, during which he appeared successfully as Fra Diavolo, the Prophet, Robert, etc., made a tour of America with his elder brother. During this tour he temporarily lost his voice, and after recovering it fell a victim to insanity. He died in an asylum near Bonn. He was gifted with much dramatic fervor and intuition, and a voice of great volume and compass.

FORMIA, fôr'mě-ă (formerly Mola di Gaeta). A city in Southern Italy, on the north shore of the Gulf of Gaeta, 68 miles by winding rail northwest of Naples (Map: Italy, H 6). The lower slopes of the mountains that rise behind it are covered with groves of olives, lemons, oranges, and pomegranates. Noteworthy are the ruins of the so-called Villa of Cicero, or Villa Caposele, formerly the favorite residence of the kings of Naples, with ancient inscriptions and statues. From the upper terrace of the villa is a splendid view of the Gulf of Gaeta, the island of Ischia, and the promontories around the Bay of Naples. There is some coasting trade. Population, in 1881, of commune, 8600; in 1901, 8108.

FORMIC ACID (from Lat. *formica*, ant), CH_3O_2 . The simplest and one of the earliest known of the so-called fatty acids of organic chemistry. It derives its name from the circumstance of its having been first obtained from the *Formica rufa*, or red ant. In a concentrated state it is a fuming liquid with an irritating odor, and causes vesication if dropped upon the skin. If pure, it solidifies at moderately low temperatures, forming a crystalline mass that melts at 8.3°C . It boils at a slightly higher temperature than distilled water, yielding a vapor that burns with a blue flame. It is a powerful antiseptic, and acts chemically as a reducing agent; for instance, readily reducing the salts of silver, mercury, platinum, and gold. It may be obtained in various ways. For example: (1) By the distillation of red ants with water; (2) by the action of acids or alkalis upon hydrocyanic acid; (3) by the oxidation of various organic substances, such as sugar, starch, wood alcohol, etc.; (4) by the action of alkalis upon chloral or chloroform; (5) synthetically (Berthelot), by keeping carbonic-oxide gas for a prolonged period in contact with potassium hydroxide at a temperature of 100°C . Kolbe and Schmitt obtained it also by the reduction of carbonic acid—a reaction of great importance, as it suggests a possible explanation of the process by which the transformation of carbonic acid into complex organic substances is effected in the organism of plants; for, since formic acid itself is a very common product of the oxidation of organic bodies, it is easy to conceive how such bodies may be formed in plants by a reversed

process—that is to say, by the reduction of formic acid, and hence of carbonic acid.

The most convenient method of preparing formic acid consists in gradually adding crystallized oxalic acid to anhydrous glycerin at a temperature slightly above 100°C ., oxalic acid decomposing into formic and carbonic acids according to the following equation:

In the animal organism formic acid occurs not infrequently, either free or in combination; thus, it is found not only in ants, but in the poison of the bee and wasp, and in the hairs of the procession caterpillar. It has also been detected in sweat, in the expressed juice of the spleen, pancreas, thymus gland, and muscles, in the brain, the blood, and the urine.

The salts of formic acid, called *formates*, or *formiates*, are crystalline substances, soluble in water, and, if heated above 400°C ., readily transformed into salts of oxalic acid. Chemically, formic acid is both an acid and an aldehyde, its molecule containing both the acid group COOH and the aldehyde group CHO :

Formic Acid

and it is to the presence of the latter group in its molecule that formic acid owes its reducing properties. See ALDEHYDES.

FORMICARIIDÆ (Neo-Lat. nom. pl., from *Formicarius*, from Lat. *formica*, ant). The ant family. See ANT; *Social Insects*, under INSECT.

FORMICATION (Lat. *formicatio*, from *formicare*, to crawl like an ant). A peculiar sensation of partial numbness and tingling of the skin, such as might be produced by the creeping of ants or other small insects over the surface. It is one of the forms of disordered tactile sensation, or paræsthesia, and resembles the awakening from numbness, or from a limb being 'asleep.' It is sometimes a symptom of spinal disease. It may be due to pressure on a nerve, or to poisoning by aconite; in the latter case the feeling is experienced in the tongue and cheeks.

FORMIGÉ, fôr'mě'zhă', JEAN CAMILLE (1845—). A French architect, born at Bouscat (Gironde). He studied architecture under J. C. Laisné, and prepared for the Government a series of plans and restorations of various public buildings, including the famous Roman Theatre at Orange. In 1885 he became architect of streets and parks at Paris. He constructed the buildings of Liberal Arts and Fine Arts at the Exposition of 1889, and of Rumania at that of 1900.

FORMOSA. A Territory of Argentina, South America, occupying the northeast portion of the Republic, and lying between the rivers Pilcomayo and Bermejo (Map: Argentina, E 8). It borders on Paraguay on the northeast and east, the Chaco Territory on the south and west, and the Province of Salta on the northwest. The area is estimated at 42,000 square miles. The surface is level, with an elevation of about 350 feet, the territory form-

ing a part of the great Chaco plain. Very little is known about the region. Its population was put in 1900 at 5589. The chief settlement is Formosa, on the Paraguay River, with about 1600 inhabitants. The town was founded after General Victorica defeated the natives of Chaco in 1884-85.

FORMOSA. A large and important island of the western Pacific, which formed part of the Empire of China until 1895, when it was ceded to Japan by the treaty concluded at Shimonoseki (q.v.). With the adjoining group of forty-seven islands known to foreigners as the Pescadores (q.v.), ceded by China to Japan by the same treaty, it forms a province of the Japanese Empire under the name of Taiwan.

TOPOGRAPHY. Formosa lies off the east coast of China, opposite the Province of Fu-kien, from which it is distant about 90 miles. It stretches in a general northeast to southwest direction from latitude $25^{\circ} 16'$ to $21^{\circ} 53' N.$, and extends east and west from longitude $120^{\circ} 15'$ to $122^{\circ} 5' E.$ Its length is about 235 miles, and its greatest breadth 90 miles; estimated area, 13,418 square miles. Its shape is that of a long oval running to a point known as South Cape. Forty miles east of this lies the island of Botel Tobago, and a little farther north the small island of Samasana. Formosa is regarded by some as a link in the chain of volcanic islands which form the eastern escarpment of a former Malayo-Chinese continent. Along the greater part of the west coast facing China the water is shallow, while on the east coast deep water is found at once.

Throughout almost the entire length of the island, but nearer the east coast than the west, runs a great chain of forest-clad mountains, with peaks ranging from 7000 to nearly 15,000 feet in height. The two highest are Mount Morrison, called Mu-kang Shang by the Chinese, 14,360 feet, and Mount Sylvia, 11,380 feet. East of this massive backbone the country is mountainous, abruptly terminating in a precipitous coast and a few small rocky islands. Some of the cliffs present a sheer descent of from 3000 to 6000 feet. To the west of this mountainous region lies a range of low, barren clay hills, and to the west of this is a broad alluvial plain stretching from north to south, intersected here and there with water-channels, terminating in sand-banks and long muddy spits, the whole coast presenting a remarkable contrast to the bold rocky face of the east. The land on the west side is regularly gaining on the sea, owing, no doubt, to the sediment brought down from the mountains by the water-courses, especially during the rainy season, when travel in some parts of the interior is rendered almost impossible.

CLIMATE. Except in the north, the climate during the winter is delightful. The excessive rainfall of the north, and especially in the neighborhood of Kelung, makes it unpleasantly cold, though the temperature is generally higher than in the same latitude on the mainland of China. At Tainan the atmosphere is said to be clear and bracing. On the whole, however, the climate is very trying to many. The temperature seldom rises to $100^{\circ} F.$, but the general humidity renders even a moderate degree of heat very enervating.

FAUNA. As Formosa is included within the 'Oriental' zoögeographical region, formed to in-

clude the Indo-Chinese coast and the Malayan and Chinese islands, the general characteristics of its fauna will be found under the title **ORIENTAL REGION.** The island has not been thoroughly explored by naturalists, though Swinhoe and others have done much investigating. Its denizens are largely the same as those of the adjacent mainland, showing that there formerly was a land connection. That the separation occurred comparatively long ago, however, is probable from the fact that the island possesses a goodly number of peculiar species, though very few, if any, are of a peculiar genus. The main departures have been in small forest-keeping birds and such small mammals as moles, flying squirrels, and mice, though a special species of goat-antelope or 'serow' (*Nemorhædus Swinhœi*) has been developed in the mountains, and one of a forest deer (*Cervus taëvanus*), allied to Chinese and Japanese species, which the natives have half domesticated. The tiger seems never to have reached Formosa, where the largest beast of prey is the beautiful 'clouded tiger' (*Felis macroscelis*).

MINING. The interior has been but little explored, and little is known of the geology of the island. Gold is found in the streams and is worked. Bituminous coal abounds in over two-thirds of the island. The best-known mines are situated near Kelung, and are worked under foreign superintendence. Sulphur is found in great abundance, especially in the north. Petroleum and natural gas are found, but are still undeveloped. Iron and silver are also reported.

AGRICULTURE AND INDUSTRIES. So far, agriculture is the chief industry of the island, and is carried on principally by the Chinese. The natural conditions are favorable to the development of that industry. Camphor, tea, and sugar are the staples of the island; but there are also produced rice, millet, corn, wheat, barley, yams, sweet potatoes, indigo, hemp, jute, peanuts, etc. The forests which cover the mountainous parts are rich in bamboo, camphor, banyan, betel-nut, and other trees. The camphor-tree, which is the most important asset of the island, as it gives to Japan a virtual control of the camphor-supply of the world, is found principally in the eastern part and in some parts of the interior. These regions are occupied chiefly by the wild tribes, and it is the policy of the Japanese Government to exploit the camphor forests without interfering with the inhabitants of the region. Since the monopolization of the camphor industry in 1899, steps have been taken for the elimination of the wasteful methods of production, which, under the old régime, had threatened the complete exhaustion of the camphor-supply of the island. Tea is grown chiefly in the northern part and sugar in the southern part of the island. The manufacturing industries are few, and confined principally to the production of sugar, camphor, mineral oil, etc.

COMMERCE AND TRANSPORTATION. Formosa has been open to foreign commerce since the Treaty of Tien-tsin (1858), which provided for the opening of the four ports of Tainan, Takow, Anping, and Tamsui. There are at present altogether thirteen ports in the island, of which those of Tamsui and Kelung get nearly three-fourths of the total commerce. The two safest harbors are those of Kelung, in the north, and Takow, in the southwest. The total value of merchandise

exported from the island in 1901 was about \$7,800,000, composed principally of tea, sugar, rice, camphor and camphor oil, hemp, jute, etc. The imports of merchandise for the same year amounted to nearly \$10,800,000, and consisted chiefly of fruit products, opium, textiles, metals and metal manufactures, lumber, saki, cigarettes and tobacco, etc. Over 50 per cent. of the total trade is with Japan, whose imports from the island have doubled during the period of 1899-1901; next comes China, with about one-third of the total, and Great Britain and the United States, with about \$1,000,000 each. The trade is carried on principally by a Chinese and a few European firms, while the commercial influence of Japan is confined to the trade in camphor, opium, and salt—all Government monopolies. The total shipping amounted in 1900 to about 210,000 tons, mostly in British and Chinese bottoms. The island has only one bank, the Bank of Formosa, a private corporation under Government supervision, with a capital of about \$2,500,000, and the right of issuing notes, whose circulation, however, is confined to the island. The construction of means of transportation and communication is being pushed by the Japanese Government with great rapidity. A trunk line, from Takow in the southwestern part of the island to Kelung in the north, has been more than half completed. In 1900 the two lines connecting Kelung with Sin-chu or Tek-cham (60 miles), and the line from Takow to Tainan (26 miles), were open for traffic.

GOVERNMENT AND FINANCE. The island is under the administration of a military Governor-General, who is responsible to the Cabinet at Tokio. He is assisted by a council. The civil Governor, who resides at Tai-pei, is responsible for the civil administration. Formosa and the Pescadores are divided, for administrative purposes, into seven districts, of which three are known as *kens*, or prefectures of first rank, and the other four as *chos*, or prefectures of the second class. The judicial code of the island is different from that of Japan. The finances are still in an unsatisfactory condition, owing to the unsettled state of the island, which necessitates the maintenance of a large military force. The budget of the colony for 1900-01 balanced at about \$11,000,000, and the subvention from the mother country was estimated in that year at about \$4,500,000. The revenue is derived chiefly from monopolies. Japanese schools are being established all over the island. In 1902 there were over 16,000 native pupils in Japanese schools.

POPULATION. According to the census of 1897 the population of the whole province numbered 2,797,543 persons, of whom 52,405 were in the Pescadores; 16,321 were Japanese. In December, 1898, the figures were 2,729,503, exclusive of resident Japanese and the aborigines.

ETHNOLOGY. The population consists of three elements: (1) The Japanese, who, apart from the garrisons, are mostly officials, teachers, traders, and fishermen; (2) the aboriginal tribes and clans; and (3) the Chinese settlers, chiefly from the provinces of Fu-kien and Kwang-tung on the mainland. These occupy the plain which borders the west coast, and the regions of the north. The Hakkas (q.v.) form an important feature of this part of the population. They live in villages of their own, and carry on the

greater portion of the barter trade with the aborigines. Until comparatively recent times no official was allowed within their inclosures.

So little is known regarding the aboriginal inhabitants of Formosa that the question of their relationship is very obscure. When the early Chinese settlers arrived in Formosa, some time after the year 1430, they approached it by the west coast, where they found many tribes of savages. Those first encountered they designated *Pepohwan*, 'Barbarians of the level plain.' These were gradually dispossessed and driven eastward to the low hills which flank the mountains on the west. They have acquired a certain amount of civilization, and speak Chinese. The males for the most part dress like the Chinese, and in religious matters follow the Chinese, though they still retain many of their original notions and practices. Inheritance is through the mother. By the Chinese they are now designated *Sek-huan*, 'cooked' or 'tamed barbarians,' as distinguished from the *Chi-huan*, 'raw' or 'untamed barbarians,' whose habitat is in the mountains beyond, and in the south. These are divided into many tribes and clans, with a great variety of languages and dialects, and preserve in their wild independence their ancient customs and institutions—bodily ornaments and mutilations, tattooing, head-hunting, spirit and nature worship, etc. They live in villages, have houses of stone roofed with great slabs of slate, and are remarkably neat and clean. Those living on the hill-sides build houses of bamboo, grass, and mud. Order prevails everywhere, and in marriage matters they are very strict. Often a large house is provided outside the village where the unmarried men sleep. They cultivate millet and other crops.

HISTORY. Chinese records speak of an expedition against Formosa undertaken as early as the year 603. Japanese adventurers are said to have landed and made conquests in it in the twelfth century, and we are told that from the fifteenth century the eastern or aboriginal half was officially considered by the Japanese as a part of their empire. The first Europeans to visit the island were Portuguese. This was in 1590. The Spanish attempted to hold a part of the island, but were driven out by the Dutch, who had gained a footing in the Pescadores in 1621. In 1624 the Dutch occupied a point near Taiwan, where they built a fort and a town which they called *Zeelandia*, began commercial operations on a great scale, opened schools, and inaugurated mission work. When in 1620 the persecution of native Christians broke out in Japan, large numbers of them fled to Formosa and formed a colony, but later dwelt with the Dutch until the latter were forced in 1662 to withdraw, as the result of many conflicts with the Chinese settlers, and with Koxinga (q.v.), the famous pirate, who succeeded in making himself King of the island. After a brief and stormy reign his successor was dethroned by the Manchu Emperors. The opening in 1858 of Formosa to foreigners was an important event in the history of the island. Roman Catholic missions were established in 1859. Protestant missions in 1860, and by 1864 a prosperous foreign trade had been established. The aborigines, however, continued to give trouble. As the result of the murder of a number of Japanese sailors by the natives, China was appealed to for redress, but disclaimed re-

sponsibility for the acts of the savages. In 1874 the Mikado sent a punitive expedition under General Saigo. On the protest of the Peking Government, however, the Japanese retired, but only on conditions secured in Peking by the Japanese envoy—Soyeshima (q.v.)—that China should reclaim and govern eastern Formosa, and pay the expense incurred by Japan. In 1884 Kelung was taken by the French under Admiral Courbet and held until June, 1885.

One result of the Chino-Japanese war over Korea, in 1894-95, as specified in the Treaty of Shimonoseki (q.v.), was the cession of Formosa to the Mikado's officers, June 2, 1895. The Chinese officials on the island, summoning the Black Flag General, Liu, to their aid, declared a 'republic.' Forthwith the Japanese Imperial guard of 7000 men was dispatched, the rebellious republic was duly crushed, and the natives were chastised. Then began the costly occupation and development. Outbreaks have been frequent, but order is being rapidly evolved from the complicated conditions of races and interests.

BIBLIOGRAPHY. This is extensive, but it may be simplified by consulting Henri Cordier's *Bibliographie des ouvrages relatifs à l'île Formose* (Chartres, 1803). The works of the early annalists contain much that is both useful and curious. See Imbault-Huart, *L'île Formose* (Paris, 1893). For those who can read French, this is an excellent work to refer to. Other general works on Formosa are: Campbell, *Missionary Success in Formosa* (London, 1889); Mackay, *From Far Formosa: the Island, Its People and Missions* (New York, 1896); *Geschichte Formosa bis Anfang 1898* (Bonn, 1898); Swinhoe, *Notes on the Island of Formosa* (1863). Mr. Swinhoe was a naturalist. Le Gendre, "Account of a Visit to the Southern Tribes," in *United States Commercial Relations for 1868-69*; House, *The Japanese Expedition to Formosa* (Tokio, 1875). The astonishing literary imposture may also be consulted: Balmanazar, *Description of Formosa* (London, 1705). Davidson, *The Island of Formosa* (1902), is the most recent work on the subject.

FORMOSAN DEER. A species of deer (*Cervus taëvanus*) peculiar to the mountains of Formosa, and frequently caught in traps by the people and tamed as a pet. It is one of the 'sika' group, which includes the spotted deer of Japan and others of Manchuria. It is lighter in color than the others, while the spots have a tendency to persist during winter; and the tail is white with a black stripe down the middle of its upper side. See Sika.

FORMOSUS. Pope, 891-896. He was born about 816, probably in Rome, and first appears in history as Cardinal Bishop of Porto (864); he was sent on an embassy to the Bulgarians by Nicholas I. in 866, and trusted with important missions by Adrian II. Having sided with the German faction against John VIII., he was excommunicated and banished; but on taking an oath never to return to Rome, or again to assume his episcopal functions, he was readmitted as a layman to the rites of the Church (878). From this oath he was absolved by Marinus, the successor of John VIII., and restored to his dignities (883); and on the death of Stephen VI., in 891, he was chosen Pope. The Italian faction had chosen Sergius; and the election of Formosus, which was in opposition to an old rule

against the translation of bishops from one see to another, could not be confirmed without violence, but he was rendered secure for a time by the success of the arms of Arnulf of Germany. After the withdrawal of Arnulf, Formosus was compelled to grant the Imperial crown to Lambert, son of Guido of Spoleto; but this act did not pacify the Italian faction, and Formosus was released from very hard straits only by the arrival of Arnulf, who captured Rome in the end of 895. In the following year Arnulf was crowned Emperor by Formosus, who died soon after. His successor, Stephen VII., had his body disinterred and treated with contumely as that of a usurper of the Papal throne; but Theodorus II., in 897, restored it to Christian burial, and at a synod presided over by John IX., in 898, the pontificate of Formosus was declared valid and all his acts confirmed.

FORMS, or QUANTICS. In mathematics, rational, algebraic, integral, homogeneous functions of r variables, $x_1, x_2, x_3, \dots, x_r$, the degree of these variables being the order of the form. If $r=2$ there results a binary form; if $r=3$, a ternary, etc., terms due to Gauss (1801). Symbolically, a binary form may conveniently be represented by $f(x_1, x_2) = \sum_{r=0}^n \binom{n}{r} a_r x_1^{n-r} x_2^r$. With

algebraic forms is connected the study of invariants and covariants, the whole subject being sometimes called, by the English, the theory of quantics, or modern higher algebra. The theory was first extensively investigated by Gauss (q.v.), although Lagrange had already studied the invariant property of the discriminant (Sylvester, 1852; Gauss had called it the determinant, 1801) $a_0 a_2 = a_1^2$, of the quadratic form $a_0 x^2 + 2a_1 xy + a_2 y^2$, finding, namely, that it is unaltered by substituting $x + \lambda y$ for x . To Boole (1841) is due the discovery of the invariant property of the discriminant of every binary form. Eisenstein, Hesse, Aronhold, and Clebsch in Germany, Cayley and Sylvester in England, and Briochi in Italy, have been among the most prolific contributors to the theory. The best historic survey is that of Franz Meyer, "Bericht über den gegenwärtigen Stand der Invariantentheorie," in *Jahresbericht der deutschen Mathematiker-Vereinigung*, vol. i. (Berlin, 1892). The most important treatises upon the subject are: Cayley's "Memoirs upon Quantics," in the *Philosophical Transactions* (London, 1854 et seq.); Salmon, *Modern Higher Algebra* (Dublin, 1859, and enlarged later editions); Fiedler, *Die Elemente der neueren Geometrie unter der Algebra der binären Formen* (Leipzig, 1862); Clebsch, *Binäre Formen* (Leipzig, 1872); Faà di Bruno, *Formes binaires* (Turin, 1876; Leipzig, 1881); Gordan, *Invariantentheorie* (Leipzig, 1887); Elliot, *Algebra of Quantics* (Oxford, 1895). The most recent digest of the theory, with bibliography and historical notes, is Meyer, "Invariantentheorie," in the *Encyklopädie der mathematischen Wissenschaften*, vol. i. (Leipzig, 1899).

FORMS OF ACTION. The approved classes into which actions are divided under the common-law system of pleading and practice. They had their origin in the use of original writs, which were mandatory letters or processes issuing in the King's name, containing a statement of the alleged injury, and directing the sheriff to first command the defendant to satisfy the claim, and,

on his failure to do so, to summon him into court to answer and defend the complaint made against him. Many of these writs were of remote antiquity, some of them antedating the Conquest, and others being shaped by the clerks and judicial officers of the Norman kings. They were drafted in fixed and certain forms, providing remedies for the more ordinary and obvious civil wrongs. These writs were limited in number; and where an injured person could not make the facts of his case fit the allegations of a known writ, he was wholly without remedy, as there was no other way in which he could get his cause before the court. Thus they had the effect of limiting and defining the right of action itself, and for this reason the enumeration of writs and causes of action became identical. This condition of affairs was somewhat relieved by the introduction of curious and arbitrary legal fictions, whereby an old writ was made to do service for a new cause of action. Thus, there being no form of action for the recovery of goods unlawfully detained by a tort-feasor, the action in trover, originally devised to permit the recovery of lost goods from the finder, was without change of form made available for the more general purpose. For example, if A, having B's goods in his possession, wrongfully withheld them from B, the writ would allege that B had casually lost the goods and A had found them, but, although knowing them to be the goods of B, had refused to deliver them to him. B was not required to prove this fiction, but could show the true circumstances, which might be that he had given A the goods to store for him, to be

returned on demand, and that A had converted them to his own use.

A further important modification of the ancient forms of action was effected by a statute enacted in the reign of Edward I., which provided that where the facts of a new case were similar to those covered by a known writ, the clerks of Chancery should have power to frame a new writ to meet the exigencies of the case. This caused an increase in the number of writs, and consequently in forms of action, the new forms being known as actions on the case, i.e. actions in similar cases (*in consimili casu*), and contributed very greatly to making the common-law system more efficient in the administration of justice. Notwithstanding these changes, forms of action have always remained inflexible and insufficient for the relief of many civil wrongs, and this inflexibility has been a potent cause of the growth of equity jurisdiction.

The following were the principal forms of action at common law: Assumpsit, Covenant, Debt, Account, Trespass, Trover, Case, Detinue, Replevin, Ejectment, and Writ of Entry. They have been abolished in England by the Judicature Acts (q.v.), and in several of the United States have been superseded by modern forms of action instituted by codes of procedure; but they are still in use with some changes and modifications in some jurisdictions. See ACTION; COMMON COUNTS; COMMON FORMS; PLEADING; PRACTICE.

FORMS OF ADDRESS. In those countries where gradations of rank and title prevail there is great complexity in the forms of address. As

PERSONAGE	Address of Letter to	Beginning of Letter to and reference to
Archbishop.....	His Grace the Lord Archbishop of —.....	My Lord Archbishop; your Grace.
Baron.....	The Right Hon. Lord —.....	My Lord; your Lordship.
Baron's son.....	The Hon. John —.....	Sir.
Baron's daughter.....	The Hon. Mary —.....	Madam.
	(If married, the Hon. Mrs. —)	
Baronet.....	Sir John —, Bart.....	Sir.
Baronet's wife.....	Lady —.....	Madam.
Bishop.....	The Right Rev. the Lord Bishop of —; or simply, The Lord Bishop of —.....	My Lord; your Lordship.
Countess.....	The Right Hon. the Countess of —.....	Madam; your Ladyship.
Daughter of Duke, Marquis, Earl.....	The Lady Mary —.....	Madam; your Ladyship.
Duchess.....	Her Grace the Duchess of —.....	Madam; your Grace.
Duke.....	His Grace the Duke of —.....	My Lord Duke; your Grace.
Earl.....	The Right Hon. the Earl of —.....	My Lord; your Lordship.
Eldest son of Duke, Marquis, Earl.....	Uses the second title of his family, and is by courtesy addressed as though he held the title by law.	
King.....	His [Most Gracious] Majesty the King.....	Sire; your Majesty.
Knight.....	Sir John —.....	Sir.
	(If a knight commander of any order, its initials follow name, as K.C.B., K.C.S.I.)..	
Knight's wife.....	Like baronet's wife.	
Lord Lieutenant (of Ireland).....	His Excellency the Lord Lieutenant.....	According to rank.
Lord Mayor*.....	The Right Hon. the Lord Mayor.....	My Lord; your Lordship.
Maid of Honor.....	The Hon. Mary S —.....	Madam.
Marchioness.....	The Most Hon. the Marchioness of —.....	Madam; your Ladyship.
Marquis.....	The Most Hon. the Marquis of —.....	My Lord; your Lordship.
Members of Parliament.....	The letters M.P. are added to their usual address.	
Officers in the Army and Navy.....	Their rank in the service, if above subaltern, is prefixed to any other rank.	
Prince.....	His Royal Highness the Prince of —, or Prince —; or (if the prince is a duke) His Royal Highness the Duke of —.....	Sir; your Royal Highness.
Princess.....	Her Royal Highness the Princess of —, or the Princess —, or the Duchess of —.....	Madam; your Royal Highness.
Privy Councillor.....	The Right Hon. —.....	Madam; your Majesty.
Queen.....	Her Majesty the Queen.....	My Lord; your Lordship.
Viscount.....	The Right Hon. Viscount —.....	Madam; your Ladyship.
Viscountess.....	The Right Hon. Viscountess —.....	My Lord; your Lordship.
Youngest son of Duke or Marquis.....	The Lord John —.....	Sir.
Youngest son of Earl or Viscount.....	The Hon. —.....	

* The title 'Lord Mayor' is confined to the chief magistrate of London and a few of the larger cities—until recently York and Dublin alone.

those which are most often practically useful, the ceremonious modes of addressing letters to titled personages in England are given above. It must be understood that in nearly all cases these forms are employed only where strict formality is requisite, as from complete or comparative strangers. In informal conversation it is nowhere the custom of persons of good social position to use the strict forms here given unless there are personal or professional reasons for it. Thus, for example, a very young man of good manners, speaking to an aged and distinguished peer, or a clergyman to his bishop, may call him 'My Lord'; but the King or the Prince of Wales is usually addressed by persons with whom he is acquainted simply as 'Sir,' the Queen as 'Ma'am,' a duke as 'Duke,' other peers and their wives as 'Lord ——' and 'Lady ——.'

Forms of address in the United States are not so rigidly governed by custom as in the older or monarchical countries, but it is well to know that common usage has sanctioned the following forms:

The President of the United States, Governors of States, and ambassadors and ministers to foreign countries are addressed as 'His Excellency' (the President of the United States, etc.).

The Vice-President, heads of executive departments at Washington, Justices of Supreme or Superior Courts, Lieutenant-Governors of States, Mayors of cities, etc., 'The Hon. ——' (Vice-President of the United States, etc.).

Senators and Representatives of the United States, or of the several States, 'The Hon. ——,' to which may be added their official designation.

Ex-Presidents or other former officials of the above-mentioned ranks are commonly addressed as 'The Hon. ——.'

Archbishops: 'The Most Rev. the Archbishop of ——.' (If a cardinal, 'His Eminence the Cardinal Archbishop of ——'.)

Bishops in the Roman Catholic or Episcopal Churches: 'The Right Rev. the Bishop of ——,' or 'The Right Rev. ——.' In the Methodist Church, 'The Rev. Bishop. ——.'

The use of the term 'Esquire' was at one time largely confined in America to addressing lawyers; but of late years the English practice which attributes it to any gentleman of position not possessing another title has been gaining ground, although 'Mr. ——' is still a common usage.

FORMULA, CHEMICAL. See CHEMISTRY.

FORMULA OF CONCORD. See CONCORD, BOOK OF.

FORNARINA, fôr'nâ-rê'nâ, LA. See RAPHAEL; SEBASTIANO DEL PIOMBO.

FORNEY, JOHN WEISS (1817-81). An American journalist and politician. He was born at Lancaster, Pa., and at the age of sixteen entered the printing-office of the Lancaster *Journal*. Four years later he purchased the Lancaster *Intelligencer*, and in 1840 he became proprietor of the *Journal*, and combined the two papers under the name of the *Intelligencer and Journal*. In 1845 his appointment by President Polk as deputy surveyor of the port of Philadelphia took him to that city, where he purchased a half interest in the *Pennsylvanian*, a Democratic paper of great influence, which under his editorial control attained a national importance. In 1851 he was chosen clerk of the

United States House of Representatives, serving until 1855. During his service at Washington he edited the *Union*, the organ of the Northern Democrats. In 1855 he headed the Pennsylvania delegation to the National Convention at Cincinnati, and was largely instrumental in securing the nomination of Pennsylvania's candidate, Buchanan. In August, 1857, he established the *Philadelphia Press*. Though at first a Douglas Democrat, Forney became, in the latter days of the Buchanan Administration, a pronounced Republican, and contributed largely to the organization of that party and its early successes. Elected a second time clerk of the National House of Representatives in 1859, he removed to Washington, and began the publication of the *Sunday Morning Chronicle*, which in 1862 was changed to a daily, and was throughout the Civil War looked upon as the particular organ of the Lincoln Administration. After serving as secretary of the United States Senate from 1861 to 1868, he disposed of his interest in the *Chronicle* and returned to Philadelphia, where in 1871 he was made Collector of the Port by President Grant. He was an earnest promoter of the Centennial Exposition, and visited Europe in its interest in 1875. In 1877 he sold the *Press* and established a weekly, the *Progress*, which he edited until his death. In 1880 he left the Republican Party and supported Hancock for the Presidency. He published *Letters from Europe* (1869); *What I Saw in Texas* (1872); *Anecdotes of Public Men* (2 vols. 1873); *Forty Years of American Journalism* (1877); *Life of Winfield Scott Hancock* (1880); and *The New Nobility* (1882).

FORNICATION (*fornicatio*, from *fornix*, an arch-vault, and by metonymy a brothel, because brothels in Rome were in cellars and vaults under ground). The illicit carnal intercourse by an unmarried person with one of the opposite sex, whether married or unmarried. In most countries this offense has been brought within the pale of positive law at some period of their history, and prohibited by the imposition of penalties more or less severe; but it is now usually left to the restraints which public opinion imposes on it in every community which is guided by the principles of morality and religion. In England, in 1650, during the ascendancy of the Puritan party, the repeated act of keeping a brothel, or committing fornication, was made felony without benefit of clergy on a second conviction. At the Restoration this enactment was not renewed; and though notorious and open lewdness, when carried to the extent of exciting public scandal, continued, as it had been before, an indictable offense at common law, the mere act of fornication itself was abandoned 'to the feeble coercion of the spiritual court.' In a few of the United States the offense is made a misdemeanor by statute, punishable by fine and imprisonment, but in most of the States the common-law rule prevails. Consult the authorities referred to under CRIMINAL LAW.

FORREST, EDWIN (1806-72). An American tragedian, long the most famous that our stage had produced. He was born in Philadelphia, March 9, 1806, of Scottish and German descent. Already he had attracted attention in amateur theatricals when, November 27, 1820, he made his first regular appearance at the Walnut Street

Theatre, in Philadelphia, in Home's *Douglas*. By diligence and close study he rose in the profession, and in 1826, at the Park Theatre, New York, made a decided triumph in *Othello*. Thenceforward his career was one of distinction, both in this country and in England, where he made his first appearance at Drury Lane in *The Gladiator* in 1836. There in 1837 he married Catharine, the daughter of John Sinclair, the singer. In later years he became jealous of her, and the trial by which, in 1852, he obtained a divorce was one of the most celebrated cases of the time. His quarrel with Macready was another affair which did him little honor. Much of the odium that has been cast upon him for the Astor Place Riot in New York (1849), which was ostensibly in favor of Forrest against his English rival, was certainly undeserved; for that unfortunate outbreak was really one of the episodes of the native American movement of the period; but Forrest's relation to the matter was far from dignified. Though he lost the favor of many of the best people, his success upon the stage was, nevertheless, uninterrupted. He had already made a fortune, and built a castle upon the Hudson, called 'Fonthill'; later he established himself in a home in Philadelphia. His last professional appearance was in 1871. He died December 12, 1872, from apoplexy, after an illness of half an hour, and in his will left a large portion of his ample estate to found a home for aged and destitute players.

Forrest has been called essentially a melodramatic actor. His robust physique and voice made the assumption of sentimental parts almost impossible. In Shakespeare his best rôles were Richard III., Lear, Coriolanus, and Othello, but he was even more effective in Virginius, Metamora, Spartacus, Damon, and characters of that range. His personal disposition was impetuous and frank, though marred at times by jealousy and an excessive opinion of his own merits. His scholarship in the line of his profession was good, and he gathered a splendid library, in which the Shakespearean collection was famous. Consult: Barrett, *Edwin Forrest* (Boston, 1882); Alger, *Life of Edwin Forrest, the American Tragedian* (Philadelphia, 1877); Rees, *The Life of Edwin Forrest, with Reminiscences and Personal Recollections* (Philadelphia, 1874).

FORREST, FRENCH (1796-1866). An American naval officer, born in Maryland. He distinguished himself as a midshipman in the War of 1812, and was present at the battle of Lake Erie. In 1817 he became a lieutenant, in 1837 was promoted to be commander, and in 1844 to be captain. During the Mexican War he served as adjutant-general of the naval and land forces. He joined the Confederate side at the outbreak of the Civil War, was appointed to the command of the navy yard at Norfolk, and subsequently became Acting Assistant Secretary of the Confederate Navy.

FORREST, Sir JOHN (1847—). An Australian explorer and politician, born in Western Australia. He entered the survey department of that colony in 1866, in 1869 commanded an expedition to the interior in search of Dr. Leichardt, and in 1870 led an exploring expedition from Perth to Adelaide. In 1874 he commanded a second exploring expedition, from Champion Bay on the west coast to the overland telegraph

line between Port Darwin and Adelaide, a distance of about 2000 miles. He was appointed Deputy Surveyor-General of Western Australia in 1876, and Commissioner of Crown Lands and Surveyor-General in 1883. From 1890 to 1901 he served as first Premier and Treasurer of Western Australia under a responsible form of government. He was also Postmaster-General of Australia in 1900-01, and in 1897 was elected President of the Federal Council of Australia. In 1901 he became Minister of State for Defense for the Commonwealth of Australia. The gold medal of the Royal Geographical Society of London was awarded to him in 1876. His publications include: *Explorations in Australia* (1876), and *Notes on Western Australia* (1884-87).

FORREST, NATHAN BEDFORD (1821-77). An American soldier, distinguished as a cavalry leader on the Confederate side during the Civil War. He was born near the site of Chapel Hill, Tenn., on July 31, 1821; removed with his father, a blacksmith, to Tippah County, Miss., in 1834; attended school for only about six months altogether; joined an uncle in the horse and cattle trading business at Hernando, Miss., in 1842; later became a slave-trader at Memphis, Tenn., and by 1859 had accumulated a considerable fortune. Though at first opposed to a dissolution of the Union, he entered the Confederate Army as a private in June, 1861, soon after the outbreak of the Civil War, and in July was called upon by Governor Harris of Tennessee to organize a battalion of cavalry, of which, in October, he became lieutenant-colonel. Soon afterwards he was ordered to Fort Donelson, where he remained until Grant's attack, and with Floyd escaped on the night of February 15-16, 1862, leaving Buckner to surrender on the 17th. (See FORT HENRY AND FORT DONELSON.) On July 21, 1862, he was promoted to be brigadier-general, and thereafter served in Kentucky for some time under General Bragg. He was transferred to northern Mississippi in November, 1863, was promoted to be major-general on December 4th of that year, and in November of the following year was placed in command of all the cavalry with the Army of Tennessee. On January 24, 1865, he was placed in command of the cavalry in Alabama, Mississippi, and east Louisiana; on February 28th became a lieutenant-general; in March was defeated at Selma, Ala., by Gen. J. H. Wilson; and in May surrendered at Gainesville, his troops being included in the arrangement made by Gen. Richard Taylor with General Canby. In the North he became unfavorably known as the leader of the Confederates at the so-called 'massacre of Fort Pillow,' though he uniformly denied the charges that were brought against him. (See FORT PILLOW.) After the war he worked his plantation for a time, was president from 1868 to 1874 of a company which endeavored without success to build a railroad between Memphis and Selma, and subsequently until his death conducted two large plantations, one on President's Island and the other in Shelby County, Tenn. During part of the Reconstruction period he is said to have been at the head of the Ku-Klux Klan (q.v.). Consult: Jordan and Pryor, *Campaigns of Nathan B. Forrest* (New York, 1868); Wyeth, *Life of General Nathan Bedford Forrest* (New York, 1899); and Mathes, *General*

Forrest (New York, 1902), one of the "Great Commanders Series."

FORREST CITY. The county-seat of Saint Francis County, Ark., 90 miles east by north of Little Rock; on the Saint Louis, Iron Mountain and Southern and the Choctaw, Oklahoma and Gulf railroads (Map: Arkansas, E 2). It is the centre of a fertile agricultural and stock-raising district, and has manufactures of spokes, cottonseed oil, etc. Population, in 1890, 1021; in 1900, 1361.

FORRESTER, ALFRED HENRY (1804-72). An English artist, whose pen-name was **ALFRED CROWQUILL**. Born in London, he was educated at a private school in Islington, and became associated in business with his elder brother, a notary, but retired in 1839. At the age of twenty he began to contribute to various periodicals, and afterwards practiced drawing and modeling, wood and steel engraving. He contributed sketches to *Punch*, the *Illustrated London News*, other periodicals, and several annuals; exhibited pen-and-ink sketches at the Royal Academy (1845-46), and illustrated many books, six of which he wrote himself. *Phantasmagoria of Fun* (1843) is representative of his best work, and some of his other publications are: *A Bundle of Crowquills* (1854); *The Comic Arithmetic* (1844); *The Book of Ballads* (1849, with Doyle and Leech). His elder brother, **CHARLES ROBERT** (1803-50), also employed the name of Alfred Crowquill. Charles was for a time on the staff of the *New Monthly Magazine* and *Bentley's Miscellany*. He was the author of several novels and tales.

FORRESTER, FANNY. The pseudonym of Miss Emily Chubbuck, who became the wife of Adoniram Judson, the American missionary. See **JUDSON, ADONIRAM**.

FORSBERG, förs'ber-y', NIELS (1841—). A Swedish painter, born at Riseberga, Skåne. The son of a peasant, he spent his early years in farming, then was apprenticed to a house-painter at Göteborg. Dabbling in sculpture, he fashioned a statue of Minerva good enough to procure for him a Government stipend which enabled him to go to Paris in 1867. There his true vocation was discovered to be for painting, and he became the pupil of Bonnat. The siege of Paris, during which he enlisted in the Ambulance Department, afforded him many opportunities for studying and sketching the stirring scenes that came under his observation. In 1878 he exhibited "An Acrobat Family," now in the Museum at Göteborg, but his finest production, "The Hero's Death" (1888), for which he was awarded the great gold medal, is in the National Museum at Stockholm. Afterwards he devoted himself more especially to historical subjects.

FORSETE, för-sët'e, or FORSETI, för-sët'e (Icel., Fore-seated). The son of Balder, and the god of Justice, in Norse mythology.

FORSHEY, CALEB GOLDSMITH (1812-81). An American engineer, born in Somerset County, Pa. He was educated at Kenyon College, Ohio, and at West Point, but left the latter institution in 1836 before graduating, and became professor of mathematics and civil engineering at Jefferson College, Miss. He was engaged in engineering work in the Southwestern States for several years, was engineer in charge of the Government survey of the Mississippi River delta from 1851

to 1853, and from 1853 to 1855 was chief engineer of the Galveston, Houston and Henderson Railroad. From 1855 to 1861 he was principal of the Texas Military Institute. On the outbreak of the Civil War he joined Sam Houston in actively opposing the secession movement in Texas in public meetings and in conventions. After the secession of the State, however, he offered his services to the Confederacy, and was commissioned a lieutenant-colonel of engineers, in which capacity he performed valuable services both in Virginia, where he served on the staff of General Magruder, and in Texas. After the war he engaged in railway engineering and in work on the Mississippi River and its branches. He was one of the authors of *The Physics of the Mississippi River* (1861).

FORSKÅL, för'skål, PETER (1732-63). A Swedish botanist. He was born at Helsingfors, studied at Göttingen, and was professor at Copenhagen. In 1761 he took part in a scientific expedition to Egypt and Yemen, where he collected several hundred plants which had previously been unknown. Seized with an attack of the plague, he died on his journey in Arabia. Among his publications are: *Dubia de Principiis Philosophiæ Recentioris* (1756); *Descriptiones Animalium, Avium, Amphibiorum, Piscium, Insectorum, Vermium, quæ in Itinere Orientali Observavit Petrus Forskal* (1775); and *Flora Egyptiaco-Arabica* (1775). The genus *Forskalia* is named in his honor.

FORSSELL, förs'sël, HANS LUDWIG (1843-1901). A Swedish historian and statesman, born at Gefle. He was educated at the University of Upsala, where he became a lecturer in 1866. In 1875-80 he was Finance Minister in the Council of State, and from 1888 president of the Exchequer. From 1879 to 1897 he was a member of the Upper House of the Riksdag. He largely assisted in the establishment of the gold standard for Swedish currency, and wrote *Studier och Kritiker* (1875-88), collections of essays; *Sveriges inre historia från Gustaf I.* (1869-75); and *Anteckningar ur Sveriges jordbruksnäring i 16 seklet* (1884).

FORST, först. A town in Brandenburg, Prussia, on the Neisse, 44 miles south of Frankfort-on-the-Oder (Map: Prussia, F 3). It has tanneries, and manufactories of woolen cloth and buckskin. Forst was founded in the thirteenth century. It has belonged to Prussia since 1815. Population, in 1890, 23,500; in 1900, 32,075.

FÖRSTEMANN, fër'ste-mån, ERNST WILHELM (1822—). A German philologist, born in Danzig. In 1865 he became chief librarian at the Royal Library in Dresden. His services in behalf of the reorganization of the Dresden Library were most important. His principal publications include: *Altdeutsches Namenbuch* (2 vols.; 2d ed. vol. i., 1900; 2d ed. vol. ii., 1872), a valuable and interesting work devoted to a discussion of old German proper names, the volumes being respectively devoted to names of persons and places; *Geschichte des deutschen Sprachstamms* (1874-75), his most important work; *Aus dem alten Danzig, 1820-40* (1900); and an edition of, as well as several interesting treatises on, the famous Maya manuscript in the Dresden library.

FÖRSTER, fër'stër, AUGUST (1822-65). A German anatomist, born at Weimar. He was

educated at Jena, and subsequently held professorships at Göttingen (1852-56) and Würzburg (1856-65), where his investigations on pathological histology and teratology gave him a wide celebrity. His chief publications include: *Lehrbuch der pathologischen Anatomie* (10th ed. 1875); *Atlas der mikroskopischen pathologischen Anatomie* (1854-59); *Grundriss der Encyklopädie und Methodologie der Medizin* (1857).

FÖRSTER, ERNST (1800-85). A German art critic and painter, brother of Friedrich Christoph, the historian and poet. He was born near Camburg, Saxe-Meiningen, April 8, 1800, and at first applied himself to the study of theology and philosophy, but soon devoting himself to art, entered the studio of Peter Cornelius at Munich. He was employed in painting the frescoes in the Aula at Bonn, and those of the Glyptothek and the arcades at Munich; but his reputation rests chiefly on his discovery of several ancient pictures, and on his works on the history of art. His greatest discovery was the frescoes of Avanzo, which date as far back as 1376, in the Chapel of San Giorgio at Padua. Among his paintings are "Hellas Liberated," and portraits of the Duke and Duchess of Altenburg and children. Among his frescoes are scenes from Goethe's poems, and scenes from Wieland's *Musarion* and *Die Grazien*, Royal Palace, Munich. Among his works are excellent guide-books to Munich, Italy, and Germany; *Die Wandgemälde der Sanct Georgenkapelle zu Padua* (1859); *Vorschule der Kunstgeschichte* (1862); *Denkmale deutscher Baukunst, Bildnerei und Malerei* (1853-69); *Geschichte der deutschen Kunst* (1851-60); *Geschichte der italienischen Kunst* (1869-78); *Peter von Cornelius* (1874). Most of these works were illustrated by woodcuts after his own designs. He wrote a life of Jean Paul Richter, who was his father-in-law, and edited several of his works. He died at Munich, April 29, 1885.

FORSTER, fôr'stâr, FRANÇOIS (1790-1872). A French engraver, born at Locle, Switzerland. He studied in Paris under the engraver Langlois, and then entered the Ecole des Beaux-Arts, where he won the Grand Prix de Rome in 1814. He engraved a number of historical subjects and portraits which have given him some reputation. Among these are: "Francis I. and Charles V. Visiting the Church of Saint Denis" (1833, after Gros); "The Madonna of the House of Orleans" (1838, after Raphael); and the portraits of Raphael, Humboldt, Wellington, and others.

FÖRSTER, fôr'stêr, FRANZ (1819-78). A German jurist. He was born at Breslau, and in 1874 was appointed director in the Ministry of Ecclesiastical Affairs. He assisted in the compilation of the new Prussian Code of Judicial Procedure, and wrote several standard works on Prussian law, which include: *Preussisches Grundbuchrecht* (1873), and *Theorie und Praxis des heutigen gemeinen preussischen Privatrechts* (7th ed. 1896-97).

FÖRSTER, FRIEDRICH CHRISTOPH (1791-1868). A German historian and poet, brother of Ernst, the painter. He was born near Camburg, Saxe-Meiningen, and studied theology at Jena, but subsequently devoted his attention for a time chiefly to archaeology and the history of art. On the uprising of Prussia against France in 1813 he joined the Lützow sharpshooters to-

gether with Theodor Körner, and, like him, wrote spirited war-songs, many of which appeared in his *Gedichte* (1838). At the close of the war he was appointed professor in the school of engineering and artillery in Berlin, but on account of certain democratic writings he was dismissed in 1817. He then became connected with various literary journals, among them the *Neue Berliner Monatsschrift* and the *Vossische Zeitung*, and in 1829 was made curator in the Royal Museum of Berlin. His writings include: *Albrecht von Wallenstein* (1834); *Gustav Adolf* (1833), an historical drama; *Preussens Helden in Krieg und Frieden* (1846), a severely criticised history of Prussia from 1640 to 1815; and a partial autobiography published posthumously in 1873, under the title *Kunst und Leben*.

FORSTER, GEORG (1754-94). A German traveler and naturalist, born near Danzig. When seventeen years old he accompanied his father, Johann Reinhold Forster, in Captain Cook's voyage around the world, and on his return collaborated with him in an account of it, written in English, and entitled *Observations Upon a Voyage Around the World* (2 vols., 1777). After some time spent in Paris, where he made the acquaintance of Franklin, he accepted a professorship of natural history at Cassel in 1779, and in 1784 was appointed to a similar position at Vilna. In 1787 he was called to Russia by Catharine II. to undertake a voyage of discovery, which was abandoned on the outbreak of the Turkish War. In the following year he accepted the office of librarian to the Elector of Mainz. After the taking of Mainz by the French in 1792, Forster, who had become an enthusiastic republican, went to Paris as the representative of the city, to secure its incorporation in the Republic. In the recapture of Mainz by the Prussians in the next year he lost his library and collections, and determined to remain in Paris, where he died in 1794, while preparing to make an extensive trip to East India. Besides numerous briefer works on scientific subjects, he wrote *Kleine Schriften: ein Beitrag zur Länder- und Völkerkunde, Naturgeschichte und Philosophie des Lebens* (1799-97); and *Ansichten vom Niederrhein, von Brabant, Flandern, Holland, England und Frankreich* (1790-91). His letters were published by his wife, Therese, afterwards Therese Huber (2 vols., 1829), and his complete works edited by his daughter, with a characterization of the author by Gervinus (1843). For his *Life*, consult: König (Leipzig, 2d ed., 1858) and Leitzmann (Halle, 1893).

FÖRSTER, fôr'stêr, HEINRICH (1800-81). A German Roman Catholic prelate. He was born at Grossglogau, was educated at Breslau, and in 1837 was appointed chief preacher at the Cathedral of Breslau. In 1853 he was elected Bishop. At the numerous synods and councils which he attended he revealed himself as a staunch defender of the orthodox Roman Catholic creed, although he opposed the dogma of infallibility at the Council of the Vatican. In 1875, after repeated conflicts with the Prussian May laws (q.v.), he was deposed from his see. He was a famous pulpit orator. His principal works are: *Der Ruf der Kirche in die Gegenwart* (4th ed. 1879); *Die christliche Familie* (6th ed. 1893); *Kardinal Diepenbrock. Ein Lebensbild* (3d ed. 1878); *Gesammelte Kanzelvorträge* (5th ed. 1879).

FORSTER, JOHANN REINHOLD (1729-98). A German traveler and naturalist. He was born in Dirschau, was educated for the clerical profession at Halle, and in 1753 became pastor at Nassenhuben, near Danzig; but devoted most of his time to mathematics and the natural sciences. In 1765 he accepted an offer made to him by the Russian Government to inspect and report upon the new colonies founded on the banks of the Volga. His irritable temper soon involved him in difficulties with the Russian Government, and in the following year he repaired to England and became teacher of natural history at Warrington, Lancashire. In 1772 he was invited to take part in Cook's second expedition to the South Seas. In 1777 he published, in collaboration with his son, his *Observations upon a Voyage Around the World*, containing the information he had gathered in course of that voyage. In the same year he returned to Germany, and in 1780 became professor of natural history and mineralogy at Halle. Besides the above work, he published *Zoologia Indica* (1781), and *Geschichte der Schifffahrt und Entdeckungen im Norden* (1784).

FORSTER, JOHN (1812-76). An English political and historical writer, born at Newcastle. He was educated for the bar, but early devoted himself to periodical writing. His political articles in the London *Examiner*, for which he began writing in 1832, attracted unusual attention, owing to their vigor and outspoken honesty. In 1846 he succeeded Dickens as editor of the *Daily News*, but resigned the next year to assume the editorship of the *Examiner*, a post which he held for nine years. He is the author of many admirable biographical and historical essays dealing with the statesmen and the times of the English Commonwealth. Among them are: *Lives of the Statesmen of the Commonwealth* (1836-39); *The Debates on the Grand Remonstrance* (1860); *Arrest of the Five Members* (1860); *Sir John Eliot: A Biography* (1864). His literary memoirs are also excellent. The chief are: *The Life and Adventures of Oliver Goldsmith* (1848, enlarged, with a slight change in the title—*Life and Times of Oliver Goldsmith*—1854); *Walter Savage Landor* (1869); *The Life of Charles Dickens* (1872-74); and the first volume of a *Life of Swift* (1876). Forster's style is clear and forcible. He was appointed Secretary to the Commissioners in Lunacy in 1855, and a Commissioner in Lunacy in 1861.

FORSTER, FERSTER, KARL (1784-1841). A German poet. He was born at Naumburg, a son of Johann Christian Förster, preacher in the cathedral in that city. After studying theology and philosophy at Leipzig he was appointed professor of the German language and literature at the Military Academy in Dresden in 1807. He completed Wilhelm Müller's *Bibliothek der deutschen Dichter des 17ten Jahrhunderts*, and wrote many poems, several of which have been set to music. They were collected and published in 1843. His translations from the classic poets of Italy are also justly celebrated.

FORSTER, LUDWIG VON (1797-1863). A German architect, born at Bayreuth. He is chiefly remarkable for the impetus he gave to German and Austrian architecture by the foundation in 1836 of the *Allgemeine Bauzeitung*, a review de-

voted to that subject. Among the buildings erected by him in Vienna are the synagogue in the Leopoldstadt (1838) and the Protestant Church of Gumpendorf (1849). He was also architect for the Elizabeth bridge. All his work is in and near Vienna, and is executed in Renaissance style.

FÖRSTER, RICHARD (1843—). A German archæologist. He was born at Görlitz, and was educated at Jena and Breslau. In 1899 he was appointed professor of archæology at the University of Breslau. His works include: *Der Raub und die Rückkehr der Persephone in ihrer Bedeutung für die Mythologie; Litteratur und Kunstgeschichte* (1874); *Farnesina-Studien* (1880); *Scriptores Physiognomici Græci et Latini* (1893).

FÖRSTER, WENDELIN (1844—). An Austrian philologist and Romance scholar, born at Wildschütz, Bohemia, and educated in Vienna. He was professor at Prague from 1874 to 1876, and at Bonn after 1876. One of his most noteworthy achievements has been the definite establishment of the Breton origin of the Arthurian legend. His numerous publications of the older French writers include: *Elie de Saint Gille* (1876-82); *Li Chevaliers as deus espees* (1877); *Altfranzösische Bibliothek*, vols. i.-xi. (1879-87); *Romanische Bibliothek*, vols. i.-xvii. (1888-1900); *Die sämtlichen Werke von Christian von Troyes*, vols. i.-iii. (1884-90).

FÖRSTER, WILHELM (1832—). A German astronomer, born at Grünberg, Silesia. He studied at Berlin and Bonn, and became professor of astronomy at Berlin in 1863, and director of the observatory in 1865. In 1868 he was also appointed director of the commission established by the North German Confederation, and continued from 1871 by the German Empire, for the determination of standards of measurement. In this capacity he superintended the reorganization of the German system of weights and measures on the metric basis. He was elected president of the International Bureau of Weights and Measures in 1891. In 1892 he assisted in founding the German Society for Ethical Culture. His publications include: *Populäre Mitteilungen* (2 vols., 1879 and 1884); *Sammlung von Vorträgen und Abhandlungen* (2 vols., 1887 and 1890); and *Studien zur Astrometrie* (1888).

FORSTER, WILLIAM (1784-1854). An English philanthropist, born at Tottenham, near London. He became a preacher in the Society of Friends, labored as such in the United States, England, and France, and in 1846 went to Ireland to relieve the distress there caused by famine. In 1849 he was commissioned by the Quaker Yearly Meeting in London to present an address on slavery and the slave trade to rulers of the Christian nations, and within the next few years he had interviews with nearly all the monarchs of Europe, with the President of the United States, and with the Governors of a number of the Southern States. Consult Seebohm (editor), *Memoirs of the Life of William Forster* (2 vols., London, 1865).

FORSTER, WILLIAM EDWARD (1818-86). An English statesman, the only son of William Forster, the Quaker missionary. He was born at Bradpole, Dorsetshire, was educated in Friends' schools at Bristol and Tottenham, and entered

the woolen business at Bradford in 1841, where in the following year he formed a partnership with William Fison in that business, which continued to the end of his life. In 1861 he was elected from Bradford to the House of Commons, and continued to hold his seat by successive re-elections until his death. Forster at once took a prominent part in Parliamentary debates, and came to be looked upon as one of the principal leaders of the advanced Liberals. He took every opportunity of speaking on the question of the reform of the suffrage, and on the outbreak of the Civil War in America, with Cobden and Bright, earnestly opposed every attempt to recognize the Confederacy, and denounced the Government's action in permitting vessels of the *Alabama* type to be built and fitted out in English ports. In 1865 he became Under-Secretary for the Colonies in Lord Russell's Ministry, and in 1868 was appointed by Gladstone vice-president of the Council on Education and a Privy Councillor. In 1869, in spite of opposition from Radicals both in the Church of England and among Dissenters, he secured the passage of the Endowed Schools Bill, and in 1870 introduced the most famous legislative measure connected with his name, the Elementary Education Bill, which is the foundation of the existing national system of education in England. In 1872 he introduced and piloted through the House of Commons the Ballot Bill. In the Gladstone Ministry of 1880, against his own inclination, he accepted the position of Chief Secretary for Ireland. During the winter of 1881-82 several attempts were made on Forster's life by the 'Invincibles,' but he remained resolutely at his post. When, however, in May, 1882, a majority of the Cabinet determined upon the release of Parnell and the other imprisoned leaders, Forster and Lord Cowper, the Lord Lieutenant, who protested against such action, resigned. Although Forster continued to take part in the debates in Parliament, and was re-elected as a Liberal by his constituents in November, 1885, he acted on many questions independently of his party, and was opposed to the Gladstone Home Rule programme. Consult Reid, *Life of the Right Hon. W. E. Forster* (5th ed., London, 1889).

FORSYTH', ANDREW RUSSELL (1858—). An English mathematician, born at Glasgow. He was educated at Liverpool College, and at Trinity College, Cambridge, where he was senior wrangler and first Smith's prize man. He was made fellow of Trinity in 1881, was professor of mathematics at University College, Liverpool, from 1882 to 1883, and lecturer in Trinity College, Cambridge, from 1884 to 1895. He was made a fellow of the Royal Society in 1886, and succeeded Cayley as Sadlerian professor of pure mathematics at Cambridge in 1895. His principal publications are: *Treatise on Differential Equations* (1885); *Theory of Differential Equations of a Complex Variable* (1893, 2d ed. 1900). He has also published numerous memoirs on differential equations and the theory of functions, in the *Transactions of the Cambridge Philosophical Society* and in the *Philosophical Transactions of the Royal Society* (London).

FORSYTH, GEORGE ALEXANDER (1837—). An American soldier, born at Muncy, Pa. At the outbreak of the Civil War he enlisted as a pri-

vate in the Chicago Dragoons. He fought throughout the war successively in the Army of West Virginia, that of the Potomac, and that of the Shenandoah, and was four times wounded in service. He rose to be brevet brigadier-general of volunteers in 1865, was brevetted lieutenant-colonel United States Army, in 1867 (for gallantry at Dinwiddie Court House), and lieutenant-colonel of the Fourth United States Cavalry in 1881. He also obtained the brevet of brigadier-general in the Regular Army in 1868 for conduct in battle with hostile Indians. In 1875-76 he was a member of the board of officers appointed to inspect the armies of Europe and Asia, and from 1866 until his retirement for wounds in 1890 was on staff and frontier service. He published *Thrilling Days in Army Life* (1900) and *The Story of the Soldier* (1900).

FORSYTH, JAMES W. (1836—). An American soldier, born in Ohio. He graduated at the United States Military Academy in 1856, in the Civil War served as captain on the staff of Major-General McClellan during the Peninsular and Maryland campaigns, was brevetted major for gallant services at Chickamauga, and in 1864-65 was assistant adjutant-general of volunteers and chief of staff of Major-General Sheridan. In 1865 he had attained the rank of brigadier-general of volunteers, and brevet brigadier-general United States Army. He was assistant inspector-general of the Department of the Gulf in 1866-67, and in 1869-73 was aide to Lieutenant-General Sheridan. From 1873 to 1878 he was military secretary of the Division of the Missouri, in 1886 became colonel of the Seventh United States Cavalry, in 1894 brigadier-general, and in 1897 was retired with commission as major-general. He published a *Report of an Expedition Up the Yellowstone River* (1875).

FORSYTH, JOHN (1780-1841). An American politician. He was born at Fredericksburg, Va., graduated at Princeton in 1799, and in 1802 was admitted to the bar at Augusta, Ga. He was appointed Attorney-General of the State in 1808, and in 1812 was elected to Congress. He was re-elected in 1814 and 1816, and in 1818 was chosen United States Senator, a position which he held only until the following year, when he was sent by President Monroe to represent the United States as Minister to Spain. While at Madrid he successfully concluded the negotiations which resulted in the sale of Florida to the United States. On his return to the United States in 1822 he was again elected to Congress, and was re-elected in 1824. In 1827 he was elected Governor of Georgia, and on the conclusion of his term of office was for a second time sent to the United States Senate. His advocacy of Jackson's measures and policy won for him in 1834 the appointment of Secretary of State in the latter's Cabinet, in order to accept which he resigned his seat in the Senate. He served as head of the State Department during the remainder of Jackson's Administration, and was continued in office through the entire Administration of President Van Buren, whose friendship he had won in 1831 by ably supporting him when the Senate refused to confirm his nomination as Minister to England. He retired from office with the close of the Administration in 1841, and died the same year.

FORSYTH, Sir THOMAS DOUGLAS (1827-86). An Anglo-Indian legislator. He was born at Birkenhead, and was educated at Sherborne and Rugby. After a distinguished career in India he was in 1860 appointed commissioner in the Punjab, and in 1872 he was intrusted with the task of suppressing the insurrection at Malair Kotla. In the following year he was appointed envoy to Kashgar, and in 1875 was sent in the same capacity to the King of Burma to effect a settlement of the question of the Karens.

FORSYTH, WILLIAM (1812-99). An English author, born at Greenock, Scotland, and educated at Trinity College, Cambridge, where he took his M.A. in 1837. He studied law at the Inner Temple, and began practice in 1839. From 1859 to 1872 he was standing counsel to the Secretary of State for India, and from 1874 to 1880 was a member of Parliament from Marylebone. In the early part of his life his authorship consisted almost entirely of legal works, some of which are of great value, and are considered authorities on the subjects which they treat. He was editor of the *Annual Register* from 1842 to 1868. His published works include: *On the Law of Composition with Creditors* (1841); *The Law Relating to Simony* (1844); *The Law Relating to the Custody of Infants* (1850); *Hortensius* (1849), an historical survey of the law from the earliest times; *History of Trial by Jury* (1852); *History of the Captivity of Napoleon at Saint Helena* (1853); *Civil Liberty and Self-Government* (1856); *Life of Marcus Tullius Cicero* (1863); *Cases and Opinions on Constitutional Law* (1869); *Novels and Novelists of the Eighteenth Century* (1871); *Hannibal in Italy* (1872), an historical drama in verse; *History of Ancient Manuscripts* (1872); *Essays, Critical and Narrative* (1874); and *The Slavonic Provinces South of the Danube* (1876).

FORSYTHIA, fôr-sith'î-â (Neo-Lat., named in honor of William Forsyth, a Scotch botanist). A genus of shrubs of the order Oleaceæ. *Forsythia viridissima* and *Forsythia suspensa*, small Chinese shrubs now commonly cultivated under the names golden-bell and golden-rain, are hardy, and noticeable for their yellow flowers, which appear before the leaves in the spring.

FORT. See FORTIFICATION.

FORT ADAMS. A United States military post, established in 1841, and situated about three miles from the mouth of Narragansett Bay, upon Brenton's Point, the southern boundary of the entrance to the harbor of Newport, R. I. The site of this fort is said to have been occupied for defensive purposes during the American Revolution, and a permanent work of the same name was first garrisoned in 1799. The Government reservation comprises 138½ acres, 21½ of which are covered by the fort proper. In 1902 it was the headquarters of an artillery district, and had a garrison of four companies.

FORTALEZA, fôr'tâ-lî'zâ, or **CEARÁ**. The capital of the State of Ceará, Brazil, situated on an open bay, near the mouth of the Rio Ceará (Map: Brazil, K 4). It is regularly built, with broad and well-paved streets, and is one of the most beautiful cities of Brazil. Though surrounded by a sterile region, it is connected by rail with fertile inland sections. The harbor is subject to constant silting and presents difficulties

of access for large vessels; still Fortaleza ranks as the chief port of the State, and has an active trade in rubber, cotton, drugs, coffee, sugar, and animal products. Fortaleza dates from 1611, when a fort was here established by Amparo to hold the Indians in check and to prevent the Dutch from gaining a foothold in this vicinity. The city is the residence of a United States consular agent. Population, in 1890, 40,902.

FORT ANN. A village in Washington County, N. Y., 12 miles north by east of Fort Edward; on the Champlain Canal, and on the Delaware and Hudson Railroad (Map: New York, G 2). It is a summer resort, and has manufactures of knit goods and pulp. Population, in 1900, 431. A fort was built here by Colonel Nicholson on his futile expedition against Canada in 1709, and was rebuilt in 1757 and named Fort Ann. In 1758, during the French and Indian War, Captain Robert Rogers defeated near here a somewhat smaller force of French and Indians under Marin; and in 1777, during the Revolutionary War, a small force of Americans under Colonel Long, fleeing from Ticonderoga, was defeated here by a force of British, who occupied the partly burned fortifications. Fort Ann was incorporated as a village in 1820.

FORT BLISS (Tex.). A United States military post, originally established in 1868, on the Rio Grande, three miles northeast of El Paso, Tex., and distant from Santa Fé 350 miles. It stands on a reservation of 1265 acres purchased in 1890, and is designed for a garrison of four companies of cavalry or infantry. Post-office and telegraph station are located at the post.

FORT BOWYER. A fort, formerly situated on Mobile Point, at the entrance to Mobile Bay. It was built by General Wilkinson in April, 1813, was garrisoned by General Jackson with 160 men under Major William Lawrence, and on September 14, 1814, was unsuccessfully attacked by a small naval and land force under Capt. W. H. Percy. On February 8, 1815, after the battle of New Orleans, it was again attacked by the British, this time by a superior land force, and on the 11th it surrendered. Consult: Adams, *History of the United States*, vol. viii. (New York, 1889-91); and Lossing, *Pictorial Field Book of the War of 1812* (New York, 1868).

FORT CANBY. A United States military post, established in 1864, on the north side of the mouth of the Columbia River, Washington. It was originally called Fort Cape Disappointment, but the name has since been changed to Canby in honor of the distinguished officer of that name, killed by the Modoc Indians. Its garrison consisted in 1902 of two companies of coast artillery. There are post-office and telegraph stations at the post, and communication is had by steamer and Northern Pacific Railroad with Portland, Ore., 114 miles, and Seattle, Wash., 222 miles.

FORT CASWELL, kâz'wel. A United States military post, established 1825, on Oak Island, N. C., 22 miles from Wilmington, N. C., and two miles from Southport. There is a post-office and telegraph station at the post, which comprises 2325 acres. The garrison consists of four companies of artillery.

FORT CHIPPEWYAN, or **CHIPPWAYAN**. A trading station of the Hudson Bay Company at the southwest end of Lake Athabasca,

Canada, opposite the mouth of the Athabasca River (Map: Northwest Territories, G 3). It is one of the most populous of the far northern stations, owing to the location here of a mission containing about one hundred hardy orphans, sent thither to be trained as future colonists.

FORT CHURCHILL. A trading station of the Hudson Bay Company, at the mouth of the Churchill River on the west shore of Hudson Bay (q.v.) (Map: Northwest Territory, L 3).

FORT CLARK. A United States military post, established 1852, on Las Moras Creek, near Brackettville, Tex., which is the post-office. The reservation comprises 3963 acres; it is 125 miles west of San Antonio on the Southern Pacific Railroad. It is intended for the protection of the southwest frontier and Mexican border, and has quarters and stables for a regiment of cavalry or infantry.

FORT CLINTON. A Revolutionary fort on the Hudson, near West Point, intended to make the river impassable for the British fleet in 1777.

FORT COLLINS. A city and the county-seat of Larimer County, Colo., 74 miles north of Denver; on the Cache la Poudre River, and on the Colorado and Southern Railroad (Map: Colorado, E 1). It has a public library, and is the seat of the State Agricultural College, opened in 1879. The city is the centre of one of the most fertile regions of the State, watered by extensive and efficient systems of irrigation, and is engaged chiefly in agriculture and stock-raising, but has good water-power and some manufactures. Population, in 1890, 2011; in 1900, 3053.

FORT COLUMBUS. A United States military post, established in 1806 on Governor's Island, in the harbor of New York, 1000 yards south of Manhattan Island. The island in 1902 comprised 65 acres, upon which are the fort proper, with quarters for four companies of artillery or infantry, Castle William (military prison), and the headquarters of the Department of the East and of the Military Service Institution of the United States. Governor's Island was first occupied by the Dutch, who called it Nutten Island; afterwards, under the English rule, it was a perquisite of the royal Governors, from which fact it derived its name. In 1710 it became a quarantine station. In 1775 the island was first fortified and occupied successively by the American and the British troops. From 1784 to 1794 it was used as a summer resort and race-course. In 1797, under the fear of war with France, steps were taken to strengthen the defenses here. In 1800 the island was deeded to the United States by the Legislature, and in 1806 a permanent fortification was built by Colonel Jonathan Williams, of the United States Engineers, upon the site of Fort Jay, an early earthwork. In 1812 the 'South Battery' was added to the defenses. At the present time (1902) the garrison consists of four companies of coast artillery. Extensive improvements were begun in 1901, which comprise doubling the area of the island, the erection of new docks, numerous warehouses, barracks, and officers' quarters for the accommodation of a regiment of infantry. For illustration of Castle William, see FORTIFICATION.

FORT D. A. RUSSELL. A United States military post in Wyoming, established in 1867, and occupying a reservation of 4400 acres on a

branch of the South Platte River, three miles from Cheyenne, on the Union Pacific Railroad. It was named after Gen. D. A. Russell, U. S. V., who was killed in the battle of Opequan, September 19, 1864. There are barracks for eight companies of infantry, and post-office and telegraph stations at the post.

FORT DEARBORN. A fort built on the site of Chicago in 1804-05, well known from a massacre which occurred near by, on August 15, 1812. On that day the garrison of 67 men, under Capt. Nathan Heald, evacuated the fort, under orders from Gen. William Hull, and, accompanied by the resident settlers, some thirty in number, including women and children, started for Detroit under the escort of a body of Miami Indians. At a short distance from the fort they were attacked by an ambushed force of about 500 Indians, assisted by most of the escort, and two-thirds of their number were killed and the rest captured. Most of the captives were subsequently ransomed at Detroit. The fort was destroyed on the following day by the Indians, was rebuilt about 1816, was evacuated in 1823, was reoccupied in 1828, and was demolished in 1856. Consult: Wentworth, *Early Chicago*, *Fort Dearborn* (Chicago, 1881); Kirkland, *The Chicago Massacre of 1812* (Chicago, 1893); an interesting narrative in Kinzie, *Wau-bun, or the Early Day, in the Northwest* (Chicago, 1857); and the version, largely from the Indian standpoint, in an article, "The Massacre of Fort Dearborn, Gathered from the Traditions of the Indian Tribes Engaged in the Massacre," by Simon Pokagon, in *Harper's Magazine*, vol. xcvi. (New York, 1899).

FORT DE FRANCE, *fôr de frâns* (formerly Fort Royal). The capital of Martinique (q.v.), situated on the western coast of the island (Map: West Indies, R 7). It has a good harbor and is strongly fortified. In 1902 Fort de France became important as the distributing centre for supplies during the terrible eruptions of Mont Pelée (q.v.). Population, in 1896, 17,800.

FORT DE L'ÉCLUSE, *fôr de lâ'kluz'.* A fortress in the French Department of Ain, about 14 miles south of Geneva (Map: France, M 5). It was erected by the dukes of Savoy, but was repeatedly destroyed by the Swiss during the sixteenth century. Rebuilt by Vauban at the command of Louis XIV., it was dismantled by the Austrians in 1815. Since 1824 it has been restored and strengthened. It occupies a crag 1385 feet high, at the foot of Mont Credo, which commands the passage of the Rhône from Switzerland through the defile of the Ecluse.

FORT DODGE. A city and the county-seat of Webster County, Iowa, 87 miles north by west of Des Moines; on the Des Moines River, and on the Illinois Central, the Chicago, Rock Island and Pacific, and two other railroads (Map: Iowa, C 2). It is an important railroad centre, and has great natural advantages. In the vicinity are vast coal-fields that employ over 2000 men, large deposits of glass-sand and excellent clay, and quarries of brown sandstone. The city has extensive manufactures of stucco and plaster, paints, brick and tile, foundry products, oatmeal, pottery, etc. There are also greenhouses with a large wholesale trade, and repair-shops of the four railroads which enter the city. Fort Dodge

maintains a public library and owns the water-works system. Population, in 1890, 4871; in 1900, 12,162.

FORT DONELSON. See FORT HENRY AND FORT DONELSON.

FORT DOUGLAS. A United States military post in Utah, established in 1862, and occupying a reservation of 9250 acres at the base of the Wahsatch Mountains, 5030 feet above the sea. There is a post-office at the post, and a telegraph station at Salt Lake City, three miles distant. It is 37 miles from Ogden on the Union Pacific Railroad, and has quarters for 500 cavalry or infantry.

FORT DU PONT. A United States military post in Delaware occupying a reservation of 173 acres opposite Pea Patch Island, in New Castle County. The nearest post-office and telegraph station are at Delaware City, Del. The garrison in 1902 included two companies of coast artillery.

FORT DU QUESNE, du'kân'. See PITTSBURG.

FORTE, for'tâ. In music, the Italian term for loud; *fortissimo*, as loud as possible. In scores these expression marks are designated respectively by *f* and *ff*. Occasionally a double *fortissimo* (*fff*) is required, especially in piano arrangements of orchestral works.

FORT EDWARD. A village in Washington County, N. Y., 55 miles north of Troy; on the Delaware and Hudson Railroad (Map: New York, G 2). By means of a dam at this point the Hudson furnishes good water-power, and the village has extensive paper and pulp mills, a shirt-factory, a brewery, a pottery, etc. It is the seat of the Fort Edward Collegiate Institute. First incorporated in 1849, Fort Edward is governed under a charter of 1857, which provides for a mayor, chosen annually, and a village council, elected on a general ticket. The water-works are owned and operated by the municipality. Population, in 1900, 3521.

The site of Fort Edward was known to the French and English in the latter part of the seventeenth century and the early part of the eighteenth as the Great Carrying Place. In 1709 Colonel Nicholson, while on his unsuccessful expedition against Canada, built a stockade on the spot. This fell into decay, but in 1755, during the French and Indian War, another fort, called Fort Lyman at first, but soon renamed Fort Edward in honor of the Duke of York, was erected here. In 1757 the survivors of the Fort William Henry massacre took refuge within its walls. Throughout the French and Indian War and the Revolution, the fort was the starting-point for expeditions against Canada. In 1777 it was for some time the headquarters of General Schuyler, and later was occupied by General Burgoyne. Near here, on July 27, 1777, Jane McCrea (q.v.) was killed by the Indians. Consult: Parkman, *Montcalm and Wolfe* (Boston, 1884), and an article, "Fort Edward in 1779-80," in the *Historical Magazine*, 2d series, vol. ii. (Boston, 1867).

FORTEGUERRI, for'tâ-gwér'râ. Niccolò (1674-1735). An Italian poet, born at Pistoja. Being a younger son, he was destined for the Church, and in 1695 he was sent to Rome to his uncle, Cardinal Fabroni. He accompanied an embassy to Spain, and, now in favor and again disgraced, occupied successively many ec-

clesiastical offices, being secretary of the Propaganda when he died. During his life only a few of his rhymes and prayers were published. His more important works, the *Capitoli* (of which the first edition, under the title of *Rime piacevoli*, appeared in 1765-67), the *Epistole poetiche*, and the satirical epic *Il Ricciardetto* (1738), which he wrote under the pseudonym Carteromaco, were not given to the press until after his death. We owe to him also a blank-verse translation into Italian of the comedies of Terence (1736). In his original works, which, as the form shows, are largely improvised, the satirical element predominates, and bitter attacks upon the monastic orders are not infrequent. Consult the edition of Forteguerra's works in the *Classici italiani* (Milan, 1813), to which is prefixed an Italian translation of Fabroni's biography in Latin; Procacci, *Niccolò Forteguerra e la satira toscana de' suoi tempi* (Pistoja, 1877); Camici, *Notizie della vita e delle opere di Niccolò Forteguerra* (Siena, 1885); Zaccchetti, *L'elemento imitativo nel Ricciardetto* (Reggio, Calabria, 1892); Zaccagnini, *L'elemento satirico nel Ricciardetto* (Pistoja, 1895).

FORT ERIE. A fort, formerly situated in Canada, at the head of the Niagara River, opposite Buffalo, N. Y., on the site of the present village of the same name (population, in 1900, 1000); the scene of considerable fighting in the War of 1812. It was abandoned and partially destroyed by the British on May 28, 1813, and in the succeeding two months was occupied alternately by the Americans and the British. On July 3d it was captured, with a garrison of 170 men, by the American General Jacob Brown (q.v.), and after the battle of Lundy's Lane, July 25, 1814, the whole American army, numbering about 2000 men, was withdrawn thither by General Ripley, who was soon replaced by General Gaines. The British under General Drummond advanced to attack, and from August 7th to August 14th kept up an almost constant bombardment. On November 5, 1814, the fort was blown up by the Americans, and it was never subsequently rebuilt. Consult: Adams, *History of the United States*, vols. vii. and viii. (New York, 1889-91); and Dawson, *Battles of the United States* (New York, 1858).

FORTESCUE, CHICHESTER SAMUEL. See CARLINGFORD, CHICHESTER SAMUEL FORTESCUE, Baron.

FORTESCUE, HUGH, third Earl Fortescue (1818—). An English author and politician, born in London and educated at Harrow and at Trinity College, Cambridge. Lord Melbourne made him his private secretary in 1840. In 1841 he was elected a member of Parliament, and sat continuously until shortly before he succeeded to his father's title and took his seat in the House of Lords (1861). He was a Lord of the Treasury in 1846-47, and secretary of the Poor Law Board from 1847 to 1851. In politics he identified himself with the Liberal-Unionists. He wrote: *Lectures on the Health of Towns* (1845); *Official Salaries* (1851); *Representative Self-Government for London* (1854); *Public Schools for the Middle Classes* (1864); and *Our Next Leap in the Dark* (1884).

FORTESCUE, Sir JOHN (c.1394-c.1476). An English judge. He came of an old Devonshire family and received his education at Exeter College, Oxford. He was King's sergeant-at-law

in 1441, and in the following year became Chief Justice of the King's Bench. It is known, from many records of the time, that in the early part of his career Fortescue was popular as a judge, but later fell into disfavor, because he belonged to the Court party; hence he also supported Henry VI. against Richard of York, and later against Edward IV. Many of his works were written to support the Lancastrian claims. Until the final defeat of the House of Lancaster at Tewkesbury, in 1471, he shared all their fortunes; and during the wanderings abroad, where Fortescue seems to have received the empty title of Chancellor from Henry VI., he wrote, for the instruction of young Prince Edward, his celebrated work, *De Laudibus Legum Angliæ*, a masterly eulogy of the laws of England. At Tewkesbury he fell into the hands of Edward IV., who pardoned him. He died at an advanced age, but the date has not been ascertained. A valuable and learned work by Fortescue, written in English, discussing the differences between an absolute and limited monarchy, was reedited by Plummer in 1885, under the title *The Governance of England*. His other works are numerous, but have little interest. Consult: Plummer, introduction to *The Governance of England* (Oxford, 1885); Gairdner, *The Paston Letters* (London, 1872-75); Clermont's edition of Fortescue's works, in which all writings attributed to Fortescue are published (London, 1869).

FORTESCUE, Sir JOHN (c.1531-1607). An English statesman and Chancellor of the Exchequer. He was a son of Sir Adrian Fortescue, and a great-grandson of Sir John, the Chief Justice. His father was executed when John was eight years old; but the son—possibly educated at Oxford—had his property restored by an act of Parliament in 1551. During Mary's reign his mother was in favor, and he was appointed instructor to the Princess Elizabeth. On the accession of Elizabeth, he was made keeper of the great wardrobe. He entered Parliament in 1572; in 1589 succeeded Mildmay as Under-Treasurer and Chancellor of the Exchequer, a very lucrative post, and in 1601 became Chancellor of Lancaster. This post in the Exchequer he lost when James came to the throne, but the patents for the other two offices were reissued, and he twice entertained the King. In 1604 he was candidate for the seat for Buckinghamshire in an election declared void by the Court of Chancery, and was returned on a second election. The Commons challenged the right of Chancery to decide in such a case, and after compromise on a third election Fortescue was returned in 1606. He died a little less than two years later.

FORT ETHAN ALLEN. A United States military post in Vermont, established in 1892, and occupying a reservation of 761 acres. The post-office is Essex Junction, Vt., distant two miles, and the nearest telegraph station is Burlington, Vt. (six miles away). There are quarters for 800 men, cavalry and artillery, and stables for 600 horses.

FORT FISHER. An earthwork in North Carolina, on the peninsula between the Atlantic Ocean and Cape Fear River, defending the entrance to the port of Wilmington. In the last year of the Civil War this was almost the only

port open to the Confederates, and it became a matter of importance to the Federals to close it. To this end a formidable fleet under Admiral Porter left Hampton Roads on December 13, 1864, and arrived in sight of the fort on December 20th. At 1.40 A.M. on the 24th, the powder-boat *Louisiana*, laden with 215 tons of powder, was exploded within 200 yards of the beach and 400 yards of the fort, but the latter sustained no appreciable damage. Later in the day the fleet opened fire, and in a little over an hour the guns of the fort were silenced. On the 25th the bombardment was renewed in order to cover the landing of the land forces under Gen. Benj. F. Butler, but though a reconnoitring force went within 150 yards of the fort, an assault was deemed unadvisable, and the troops reëmbarked and returned to James River. The fleet, however, remained near the fort, and on January 13, 1865, another military force of 8000 men, under command of Gen. A. H. Terry, was landed. The bombardment was renewed on the 13th and 14th, and on the 15th a joint assault of soldiers, sailors, and marines carried the fort, capturing more than 2000 prisoners and 169 guns. The Union loss was 266 killed and 1018 wounded. Early on the 16th a magazine explosion, probably the result of an accident, killed more than 100 of the Federals and about as many of the Confederates. The Confederates then blew up their remaining works, the control of the mouth of Cape Fear River passed from their hands, and Wilmington was evacuated. Consult: Ammen, *The Atlantic Coast* (New York, 1883); and Johnson and Buel (editors), *The Battles and Leaders of the Civil War*, vol. iv. (New York, 1887).

FORT GAINES. See MOBILE BAY, BATTLE OF.

FORT GAINES. The county-seat of Clay County, Ga., in the southwestern part of the State; on the Chattahoochee River and on the Central of Georgia Railroad (Map: Georgia, A 4). It is the centre of a cotton and fruit-growing region, and has cottonseed-oil mills, brick-yards, etc. Population, in 1890, 1097; in 1900, 1305.

FORT GARRY. See WINNIPEG.

FORT GEORGE. A fort, formerly situated on the Canadian side of the Niagara River almost opposite Fort Niagara (q.v.), and in the village of Newark (now Niagara). On May 27, 1813, it was taken by an American force under the actual command of Col. Winfield Scott and Commodore Perry (the commanding officer, General Dearborn, being ill). On December 10th the fort was evacuated by General McClure, to avoid an attack by a superior British force. Consult: Dawson, *Battles of the United States* (New York, 1858); and Lossing, *Pictorial Field Book of the War of 1812* (New York, 1868).

FORT GETTY, gèt'ti. A United States military post on Sullivan's Island, S. C., north of the main entrance to Charleston Harbor and nearly opposite Fort Sumter. The post-office is Moultrieville, S. C., and the telegraph station Charleston, S. C. There were, in 1902, on the reservation, which comprises 16 acres, permanent quarters for 12 officers and 250 artillerymen, and temporary accommodations for 225 men.

FORT GRANT. A United States military post in Arizona occupying a reservation of

42,341 acres, and originally called 'Camp Grant.' It is situated 2500 feet above the sea, at the junction of the Arivaypa with the San Pedro River, 56 miles north of Tucson, and was established about 1863 by the California Volunteers as a protection against the Apaches to the southern line of travel to California. There are quarters and stables for six troops of cavalry. A post-office and telegraph station is located at the post.

FORT GREBLE. A United States military post occupying a reservation of 80 acres on Dutch Island, R. I., at the western entrance to Narragansett Bay, $3\frac{1}{2}$ miles north of Beaver Tail, $4\frac{1}{2}$ miles west of Newport. The post-office is Jamestown, R. I., and the telegraph station Newport, R. I. The garrison in 1902 consisted of two companies of coast artillery. The post is named after Lieutenant Greble, United States Army, killed at the battle of Big Bethel, Va., in 1861.

FORT GRISWOLD, griz'wold, Conn. See GEOTON.

FORTH. A river and estuary of Scotland. The river is formed by the junction near Aberfoyle of two main headstreams, the Duchray Water, 16 miles long, and the Avonduh, 12 miles long, which rise in the mountains between Lochs Katrine and Lomond in the northwest of Stirlingshire (Map: Scotland, E 3). It traverses a country rich in romantic scenery. From Aberfoyle the Forth winds 39 miles southeasterly to Stirling, and at Alloa, 12 miles beyond, widens into the Firth of Forth (Map: Scotland, F 3). The Firth extends 6 miles southeast, then, with an average breadth of $2\frac{1}{2}$ miles, continues 10 miles to Queensferry, where it contracts to a mile in width and is spanned by the celebrated cantilever railway bridge, opened in 1890. The Firth extends 36 miles farther to the North Sea, expanding in width to 15 miles. The river is navigable to Alloa by vessels of 300 tons, and to Stirling by vessels of 100 tons. A canal 38 miles long connects it with the Clyde. It has important salmon and herring fisheries.

FORT HAMILTON. A United States post, established in 1831, and occupying a reservation of 167 acres on the southwest shore of Long Island. It is one of the principal defenses of New York City, commanding 'the Narrows.' The post-office and telegraph station is Fort Hamilton, N. Y. There are quarters for 650 men and stables for 200 horses. During the American Revolution the British landed here prior to the battle of Long Island, 1776.

FORT HAN'COCK. A United States military post established in 1892, occupying a reservation of 1366 acres at Sandy Hook, N. J., and commanding one of the entrances to New York Harbor. There are post-office and telegraph stations at the post. It was named after Major-General Winfield Scott Hancock, U.S.A. There is an artillery garrison, with quarters for 300 men.

FORTH BRIDGE, THE. A cantilever bridge erected over the Firth of Forth at Queensferry, Scotland, in 1883-90, famous on account of having the longest spans yet attempted. The two main spans are each 1710 feet long, and the total length of the bridge is 8295 feet. The towers are 343 feet in height. The bridge contains 51,000 tons of steel, and the whole cost of construction was about \$13,000,000.

FORT HENRY AND FORT DON'ELSON.

Two forts, twelve miles apart, in Tennessee, prominent in the early period of the Civil War; the first situated on the right bank of the Tennessee River, and the second on the left bank of the Cumberland River, both standing near the line between Tennessee and Kentucky. They were built and strongly manned by the Confederates in 1861, and were the two most important works in the first line of defense in the West. They were especially important in that they controlled the entrance to two avenues by which Tennessee and the States farther south might be entered. Early in 1862, General Grant, stationed at Cairo, asked and received permission to attempt their capture. On February 2d a flotilla of gunboats under Com. A. H. Foote, followed by land troops under Grant, left Cairo, and on the 4th arrived before Fort Henry, which was then defended by 3000 men under General Tilghman. A combined attack by land and water was planned for the 6th, but the fort was taken within an hour on that day by the naval forces alone, some time before the troops arrived. The unavoidable delay of the latter enabled most of the garrison to escape to Fort Donelson, though Tilghman and about 70 of his men surrendered with the fort. On the 12th Grant moved upon Fort Donelson with a force that ultimately numbered 27,000. The fort, having been considerably reinforced, had a garrison of between 18,000 and 21,000, including the commands of Generals Floyd, Pillow, and Buckner. On the 13th Grant began a cannonade, and on the 14th an attack was also made by the fleet; but within two hours every gunboat was disabled, 54 men were killed, and Foote was compelled to withdraw. The Confederates, hoping to open up a way for retreat toward Nashville, attempted a surprise on the morning of the 15th. They were at first successful and actually secured a line of retreat, but they failed to profit by it, and at 3 P.M. Grant, who had been absent during the early part of the engagement, for the purpose of conferring with Commodore Foote, then wounded aboard his flagship, ordered a general advance, drove the Confederates within their own lines, and gained a position within their works. About 2000 on each side were killed or wounded in the course of the day. Grant prepared for a general assault early the next morning; but the Confederate leaders, recognizing the futility of further resistance, decided to surrender. During the night, Floyd with about 1500 men, Forrest with five or six hundred, and Pillow with his staff, escaped, leaving the fort in command of Buckner. This officer had originally been ranked by both Floyd and Pillow, the former of whom, having his unsavory record as Secretary of War in mind, dreaded to surrender for 'personal reasons,' while the latter violently opposed the idea of surrendering at all. On the morning of the 16th Buckner sent a message to Grant proposing an armistice until noon and the appointment of commissioners to settle upon terms of capitulation. Grant returned on the instant the now famous reply: "No terms except an unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." Buckner had no alternative, and at once surrendered the fort with between 12,000 and 18,000 men, at least 40 guns, and a great quantity of ammuni-

tion. The terms of Grant's answer aroused the enthusiasm of the North, where, by a play upon the initial letters of his name, he soon came to be known as "Unconditional Surrender Grant." Consult: *Official Records*, vol. iv. (Washington, 1881); Grant, *Personal Memoirs* (New York, 1895); Johnson and Buel (editors), *Battles and Leaders of the Civil War*, vol. i. (New York, 1887); Force, *From Fort Henry to Corinth* (New York, 1881); and Swinton, *Decisive Battles of the War* (New York, 1867).

FORT HOWARD. A United States military post, established in 1900, and occupying a reservation of 149 acres. The post-office and telegraph station is Baltimore. It is situated at North Point, Patapsco River, $9\frac{1}{2}$ miles from Fort McHenry, and has a garrison of two companies of coast artillery.

FORTIFICATION (Sp. *fortificación*, It. *fortificazione*, Fr. *fortification*, Lat. *fortificatio*, from *fortificare*, to fortify, from *fortis*, strong + *facere*, to make). That branch of military engineering which has to do with the design and construction of temporary and permanent defenses for the protection of military forces under fire. The subject may be divided into Field Fortification, which is properly a branch of Military Field Engineering, and Permanent Fortification, the latter being subdivided into Permanent Land Fortification and Seacoast Defense. This classification will be observed in the present treatment.

FIELD FORTIFICATION.

The chief aim of a commander of a military force operating in the field is to have his (army not only in the best possible condition, but in the best position for conflict with the enemy). In spite of precautions, these conflicts may come about through accident, and an army forced to fight or in danger of attack must use every means at its command to strengthen or fortify a position which may or may not be of its commander's choosing. Often an unexpected collision of some portion of the force with the enemy may develop into a general battle. The army may be surprised in encampment. More frequently, the commanders of the opposing forces will be in a general way aware of the position and strength of the enemy. Each will know whether on the whole he prefers to give battle or to obstruct the progress of his opponent as much as possible without bringing on a general engagement except in positions affording his

er must attack to protect his own supplies. The commander expecting to be attacked will select the best available position for his troops—one which the natural advantages of the ground will make it easier for him to hold and more difficult for his opponent to attack. A section of the line will be assigned to each corps or division of his army. The length of the section thus assigned will vary greatly under different circumstances. Ordinarily, not less than six men, including those in the firing line, supports, and reserves, should be allotted for each yard of the line. Each subdivision, on reaching the portion of the line assigned to it, proceeds as rapidly as possible to fortify—that is, to make stronger its line. If practicable, the position of the line will be indicated by the engineers; otherwise, it will be inspected as soon as possible with a view to strengthening it, wherever opportunity offers.

In the Civil War, especially toward the latter part, the troops, as soon as they arrived on the line, began the construction of light trenches with their bayonets and cups. In several modern foreign armies the troops carry as a part of their equipment small intrenching spades or picks, with which a rifle-pit or lying-down trench (Fig. 1) is hastily constructed.

FIG. 1. CROSS-SECTION OF LYING-DOWN TRENCH.

FIG. 2. CROSS-SECTION OF KNEELING TRENCH.

FIG. 3. CROSS-SECTION OF STANDING TRENCH.

If time allows, this is enlarged, first into a kneeling trench (Fig. 2), and then into a standing trench (Fig. 3). The protection furnished by such a trench is ample against infantry fire, as thirty inches of earth will stop or deflect a modern rifle-bullet. See TRENCH.

FIG. 4. PROFILE OF FORTIFICATION

army natural advantages. (See RECONNOISSANCE.) The latter course will, in general, be the lot of the weaker. The stronger may also strive to occupy positions which the weak-

The opposing commander, if determined on a frontal attack, will probably make it at the earliest possible moment, in order that the defenders may have the minimum of advantage of

protection from their defenses. His command, too, will probably proceed similarly to strengthen certain portions of their own line, which must be held. If successful in capturing any portion of the enemy's line, he may turn their intrenchments in order to prevent recapture. To

FIG. 5. SHELTER TRENCH—FRONT VIEW.

obviate this the defender, circumstances permitting, will so strengthen his trenches that the parapets shall be able to resist artillery fire.

This requires a thickness in ordinary soil of nine feet or more. The nomenclature of the various portions of the profile is indicated on

FIG. 6. SHELTER TRENCH—REAR VIEW.

the accompanying cut (Fig. 4). If time allows, the interior crest of the parapet will be revetted with sod, fascines, hurdles, logs, sand-bags, gabions, or other available material. Provision will be made for draining the trenches, which will be constructed as inconspicuously as possible. The illustrations (Figs. 5 and 6) show a front and rear view of a shelter trench where pre-

FIG. 7. WIRE ENTANGLEMENTS.

cautions have been taken to hide it from view in front. The ground in front of the trenches within the most effective range of rifle fire should be cleared of everything which would hide an advancing enemy from view, or afford him cover. Obstacles designed to hold an advancing enemy as long as possible under sustained fire will be placed in front of the intrenchments. The

principal modern obstacles are wire entanglements (Fig. 7) and abatis (q.v.). There are also trous-de-loup, or shallow military pits, chevaux-de-frise, crows'-feet, and other similar obstructions. If time allows, a portion of the ground will be mined with charges of explosives (see MINES AND MINING, MILITARY), arranged to fire automatically upon the passage of troops over them. In many cases the site for the defensive line can be so chosen that the land in front shall be marshy, or can be flooded by damming a small stream.

There are usually along the line points naturally much stronger than others. Special pains will be taken to secure and strongly fortify these points by the construction of redoubts, which are inclosed works, usually polygonal, square, or triangular in shape, provided with as many as possible of the structural advantages of regular fortification, and built on a scale commensurate with the strength and character of the force by which they are to be held. These are laid out on the ground in such a way as best to utilize the natural features in securing the maximum effectiveness of the redoubt at a minimum of labor of construction. As guides in making these constructions light frameworks of wood, indicating the proper cross-section, are made and placed in position at the angles of the work. In designing the cross-section for a redoubt or intrenchment, it should be borne in mind that unless the excavation and embankment are equal in amount, earth may have to be carried some distance. In constructing such work it is usually best to assign tasks to each man or squad. About six feet or two paces of crest should be apportioned to each man. After slight experience a man can, under stress, excavate about one cubic yard of ordinary earth in the first hour, provided the lift and throw are not excessive. The amount which he can be counted upon to do per hour diminishes considerably after the first few hours. Traverses (q.v.) should be built where necessary on the works to protect portions of the line which would otherwise be enfiladed by fire from a distance. As soon as possible bomb-proof shelters should be dug out or constructed, and also, if the works are to be held for many days, magazines for the ammunition. The weak points of a defensive line are the flanks. The opposing commander may therefore strive to capture the line by attacking it in flank, where he can bring a heavy fire to bear, and will have to meet only a small fire. It is therefore of great importance that the flanks should, if possible, rest on or near some natural obstacle, as a marsh or river, which will retard the movements of the enemy. If this cannot be done, special provision will have to be made for strengthening and holding them.

During the Mexican War and in recent European wars, villages on the line were frequently placed in a state of defense. This was practicable because of the general use of masonry buildings and walls. The artillery of the defense will be stationed in the intervals between redoubts behind epaulments, constructed by heaping earth in front of the guns, or in gun-pits formed partially by embankments and partially by excavation.

Provision must be made for a system of roads in rear of the line along which troops can

be transferred from one portion of the line to the other, or by which supplies or reserves may be brought, or along which a defeated or demoralized portion of the army can retire to a position in the rear, where it may be re-formed. Bridges or other defiles in rear of the line which may serve as a line of retreat or supply should be well protected by blockhouses or bridge-heads at their ends, which will enable a small force to hold a large one in check while the army is passing.

The fortifications just described are generally known as hasty intrenchments. Where they are more carefully constructed or improved, they become known as deliberate, or semi-permanent, fortifications. The latter term is more particularly applied to the fortifications constructed around an important city which it is thought may become an object of attack on the part of an enemy, and which it is desired to hold at all hazards. They correspond to the permanent fortification applied in Europe to cities of similar importance, the main difference lying in the fact that the works are maintained in time of peace in the permanent system, while semi-permanent works are allowed to fall into disuse upon the cessation of hostilities. These fortifications will be found discussed later in this article, under Permanent Land Fortification.

The main principle upon which field fortifications are based is the fact that men protected by them present but a small target to the fire of the enemy, whereas troops not so protected are exposed. This becomes of great importance at the ranges at which modern battles are fought. (If held by a determined force they greatly increase the possibilities of the defense; and should the attacking force be defeated or become at all demoralized, would constitute a base from which the defenders could make a counter-attack.) They were largely used in the Franco-Prussian, Russo-Turkish, Cuban, Philippine, and South African wars, many instances occurring where a force with their assistance has held in check one many times larger than itself. The general subject of field fortifications has been carefully treated in Fiebeger, *Text Book on Field Fortifications* (New York, 1901).

PERMANENT FORTIFICATION.

Permanent defense or fortification is the art of strengthening in time of peace a position which it is feared may become the objective of an enemy in time of war. Many of its principles are the same as those upon which field fortification is based. The essential differences result from the fact that the latter depend on the movements of an army and are constructed as their necessity becomes apparent, whereas in the former an attempt is made to foresee and to fortify the objective in time of peace. Such fortifications are constructed in advance because it is not believed that a defense commensurate with the importance of the interests at stake can be extemporized in time of war. The same care is used in the design and construction as in such permanent works of civil engineering as bridges, railroads, and tunnels. Especially must they be adapted to the probable form of attack and to the probable garrison available for serving them. As the result of improvements in material and in methods of attack, permanent fortifications eventually become obsolete in cer-

tain respects unless ameliorated to keep pace with these improvements. The essential principle to be kept in view is that the works should be ready to meet the attack when it comes.

A country having no coast-line is, of course, subject only to attacks by land. One having a large seacoast rival and no military powers on its land frontiers is concerned primarily with seacoast defense. The two fundamentally different methods of attack give rise to two general subdivisions of the subject, namely, Land Fortification and Seacoast Defense. Most countries subject to both forms of attack require both methods of defense.

PERMANENT LAND FORTIFICATION.

HISTORICAL DEVELOPMENT. The art of fortification and the methods of attack which the fortifications have been constructed to resist or to supplement have developed together. Each improvement in one has found its counterpart in the other. In different countries the development has not always proceeded in exactly the same way. The constructions have been modified in accordance with the characteristics of the people and with the topographic features of the country. Probably the first attempt at defense consisted in the erection of fences or palisades of wood, intended to serve as physical obstructions to the advance of the attacking force. These appear in various shapes, sometimes being made of stakes driven in the ground and connected by wattling, sometimes by weaving together the branches of the natural growth of the woods, the entrance to the place being by tortuous and concealed routes. These wooden obstructions, which were subject to attack by fire and by battering and cutting tools, were sometimes further fortified by the addition of a second, and even a third, row of stakes. Later, the space between these two lines was filled with earth. (See STOCKADE.) The next general step was the substitution of masonry for wood. These improvements were met by the attack with provisions for escalade. The walls were then increased in height, and escalade became extremely difficult. Battering implements were developed for the purpose of making breaches in the bottom of the wall. These were met by placing earth in rear of the wall, bringing it up to within a few feet of the top, and furnishing a space for the movements of men at the top who could, by throwing missiles from above, interfere with the ordinary operations of the besieger at the bottom of the wall.

As the besieger became more pertinacious, this fire from above became of more importance, provision being made for extending platforms out, thus furnishing better positions from which missiles could be thrown down the face of the wall. To still further facilitate the defense from above, towers were constructed at intervals, from which it was easy to hurl missiles along the face of the wall. These towers were sometimes made so that they could be isolated from the main portion of the wall and would not necessarily succumb to an enemy who had succeeded in reaching the top of the wall. The besieger, to cope with these means of defense, utilized covered timber passages to protect himself from the missiles from above. In this way he was enabled to reach and attack the wall with battering and other implements. As these alone became insufficient to overcome the increased resistance

of the walls of defense, the besieger constructed high wooden towers from which he, in his turn, could hurl projectiles at the defenders on the walls. These towers were attacked by the defender with fire. To prevent them from being burned, the besieger covered them with rawhide. He also made use, either alone or in connection with these towers, of high banks of earth, which were gradually worked forward and higher. To meet these methods and render them more difficult of success, the defense surrounded the walls with large ditches, making provision where practicable for filling them with water at will.

The development of the various forms of bows and of catapults and other machines for throwing stones, etc., rendered the conflicts more severe and widened the area of contact between the defender and besieger. (See ARTILLERY.) Many of the walls constructed were most formidable in their proportions. They included sometimes entire cities. In other cases they were introduced as barriers to the approach of a large section of country, the greatest in length being the Great Wall of China. In Germany development occurred along somewhat different lines. More intricate protection was made in many places. Houses were developed into castles, which were placed in naturally inaccessible positions. They were gradually strengthened by many ingenious devices. The house was surrounded by a ditch, the only method of crossing which was by a drawbridge raised and lowered at pleasure from the castle. Devices such as machicoulis, loopholes, and embrasures, were provided along the outer wall, from which the defender could attack the assailant while being himself fairly well covered. The passage from the drawbridge to the interior could be barred by a portcullis, which was flanked by loop-holed rooms. The interior of the castle was provided with a high tower or keep, capable of defense after the outer walls had fallen.

The foregoing represents, in general terms, the state of the art of fortification at the time of the invention of gunpowder. The general use of the latter caused many changes in the system of fortification, which gave rise, during the nineteenth century, to the development and modification of what is known as the bastion system of defense. This system has exercised such a powerful influence on the development of fortification that a brief account of its history will be of interest. The underlying principles of all fortification are unchangeable; but their application must, of necessity, be affected by every new invention of warfare, mechanical or strategical. Consequently, while the bastion system, as a system, is practically obsolete, its basic features still remain, although in a modified form, and on a correspondingly larger scale.

Much of the nomenclature of the art also had its origin in this system, although many of the terms are now applied to parts of forts, which, in their present form, do not indicate the derivation of the word as originally applied. Reference has been made to the placing of towers at intervals along walls for the purpose of flanking the latter. These towers were either circular in plan, or square, and were known as roundels. The portion of the wall connecting them was called the curtain. The introduction of artillery caused increased thickness and decreased height to be given to the walls, and the roundels were enlarged to permit the introduction of the large

guns. With artillery the besieger possessed an advantage in that they could reach the besieger at a greater distance, and could destroy the various material objects the latter had heretofore used in approaching the walls. The besiegers were obliged to discontinue their wooden constructions and substitute trenches of earth to protect them in their advances. They also constructed breaching batteries at a distance off from the walls for the purpose of playing on the latter, breaking them down and making breaches through which an entrance could be made to the fort. The approach was generally made toward a tower, by zigzag trenches, but pointing, so far as possible, in such a direction as not to be subject to enfilade fire from any other part of the fort. It was observed that in the use of the roundels there were small areas called angles of dead space in front of the towers which could not be well covered by the fire from the tower itself. This led to an alteration of the plan to that of a pentagon, known as a bastion. One side of the pentagon was placed along the line of the wall. The angle farthest from the wall is known as the salient, the two sides adjacent to it as faces, the two sides connecting the faces with the wall as flanks.

This combination of a number of bastions connected with each other by curtains, the whole forming an enceinte, is the basis of the bastion system. The bastions were sometimes filled with earth to the grade where the guns were placed. The top surface of this filling was known as the terreplein. The length and direction of the faces, flanks, and curtain were such as to enable the ground in front of each portion to be flanked by the fire from some other part of the work. In front of the terreplein there was placed a wall originally breast-high, and therefore designated as the parapet. Ramps were inclined planes leading from the terreplein to the main level of the ground in rear, known as the parade. The general mass of the enceinte was sometimes called the rampart, and was of such a height as to afford the required protection to the materials and people in rear. On the outer side of the enceinte was the ditch. The front wall of the enceinte was the scarp. It was found that with this exposed to view the ditch could be reduced by the fire of artillery at a distance. The outer portion, i.e. the counterscarp, therefore, was raised to such a relative height that the masonry of the scarp could not be breached except by batteries coming to the crest of the counterscarp. The ground in front of the counterscarp is the glacis. A depressed road, known as the covered way, running around the work on the counterscarp, was added. As the weak points of the system were developed by attacks, efforts were made to strengthen them. A crescent-shaped work known as the demilune was placed in front of the curtain, and the ditch and covered way were extended around in front of it. To permit its faces better to be flanked, it was given the shape of a redan, and is now generally spoken of as the ravelin. The redan (q.v.) in its simplest form is constructed of two parapets of earth, built so as to form a salient angle, having the apex pointing in the direction of the enemy. It enabled the defense with its fire to enfilade and sometimes to take in reverse batteries which the besieger had succeeded in erecting on the counterscarp for the purpose of taking the adja-

cent bastions. It left, however, the curtain scarp exposed to distant fire. As a defense to this, a detached work, or *tenaille*, was constructed in the ditch in front of the curtain. The gates of the work were usually placed in the middle of the curtain, openings being made through the *tenaille* for the defenders to reach and return from the ravelin. The passageway through the ditch in front of the *tenaille* was sometimes protected with a small earthwork on either side. As the height of the parapet above the terreplein gradually increased, becoming a breast-height wall in name only, there was added immediately in rear a small earthen platform known as a *banquette*, on which the infantry troops could stand in delivering their fire. As a result of the increased power of guns, the length of each front increased. As the fire became more accurate, greater attention was paid to bringing a cross-fire on every portion of the work outside of the enceinte. The bastions were enlarged at the expense of the curtains. Provision was made for works inside the fort, which could be held after the fall of the bastion itself. Those erected in the bastion proper were known as *cavaliers*. The function of the covered way was

Palisades and other obstacles were introduced on the glacis. It was seen that as the fronts were made smaller and increased in number, the general outline of the work approached more nearly to a circle, the adjacent fronts came nearer to being on the same straight line, and capable of supporting each other better in resisting attacks. More attention was given to the use of the most effective angles in the bastion, and corresponding protection of the faces and flanks. Casemates were constructed in the flanks of the bastions for the better flanking of the ditches. To render it more difficult to enfilade the covered way, its crest was made *en crémaillère*. Short traverses were in some cases added. Redoubts were added in the ravelin. The accompanying illustration indicates a typical arrangement of the bastion system toward the end of the eighteenth century. (See Plate of FORTIFICATION, Figs. 1, 1a, and 1b.) The bastion system was used for many years, both for large and small works. In some instances the wall around a whole city, such as that of Paris, consisted of a great number of bastion fronts, while in other cases many small forts, containing all the essentials for their own defense, were constructed. An

FIG. 8. FORT ISSY—A DETACHED BASTIONED FORT.

enlarged. The covered way itself was increased in size both at its salient and reëtrance, the enlargements being known respectively as salient and reëtrant places of arms. These served as rallying-points for large numbers of defenders, who rushed out in sorties at times when it was thought a counter-attack would most embarrass the besieger.

example of the latter is shown in the illustration of Fort Issy, one of the outer defenses of Paris.

It is not practicable in an article of this length to cite the names of the various engineers who were prominent in the development of the features of the system. It would, however, be incomplete without the names of a few of the more celebrated. Albert Durer, the famous painter, was

is credited with great improvement in the development of roundels. It is not known who first suggested the change to bastions. Daniel Speckles, an engineer in Strassburg in the sixteenth century, devoted much thought to the development of the system and enunciated many principles, the force of which was not fully recognized until a century or more after his death. The system first became largely developed practically in Italy, and then throughout Europe, as a result of the fact that many Italian engineers were employed to develop the system of defenses in other countries. As the system was adopted elsewhere, characteristic national changes were made in it. In Spain the covered way, which is very essential where an active defense is desired, was little used, and sometimes omitted. Provisions for delaying the besieger by more gradual retirement were increased, while those for actively attacking him were diminished.

In Holland the nature of the country led to the use of wide wet ditches. The lack of earth resulted in the use of lower parapets, the main one being sometimes supplemented by a lower one in front for the purpose of covering with its fire the wet ditch. The works were frequently increased in number and made of more complicated plan, rendering an attack more difficult by an assailant unfamiliar with the ground. One of Holland's most distinguished military engineers was Baron Coehoorn (q.v.). In France the art of fortification by the bastion system was reduced to precise rules. The first French author of prominence was Bar-le-Duc, who lived in the latter part of the sixteenth century. Marshal Vauban (q.v.), more generally known than any other engineer in any country as an exponent of the system, was a constructing engineer, and a general, rather than a writer. He is said to have actually besieged over 50 forts, built 35 new ones, and improved some 300 old ones. He also developed the use of ricochet fire and of parallels connecting at intervals the approaches for the attack of forts. The approaches afforded additional opportunities for the establishment of breaching batteries. Later came General Curmontaigne, who brought the bastion system to its most highly developed state.

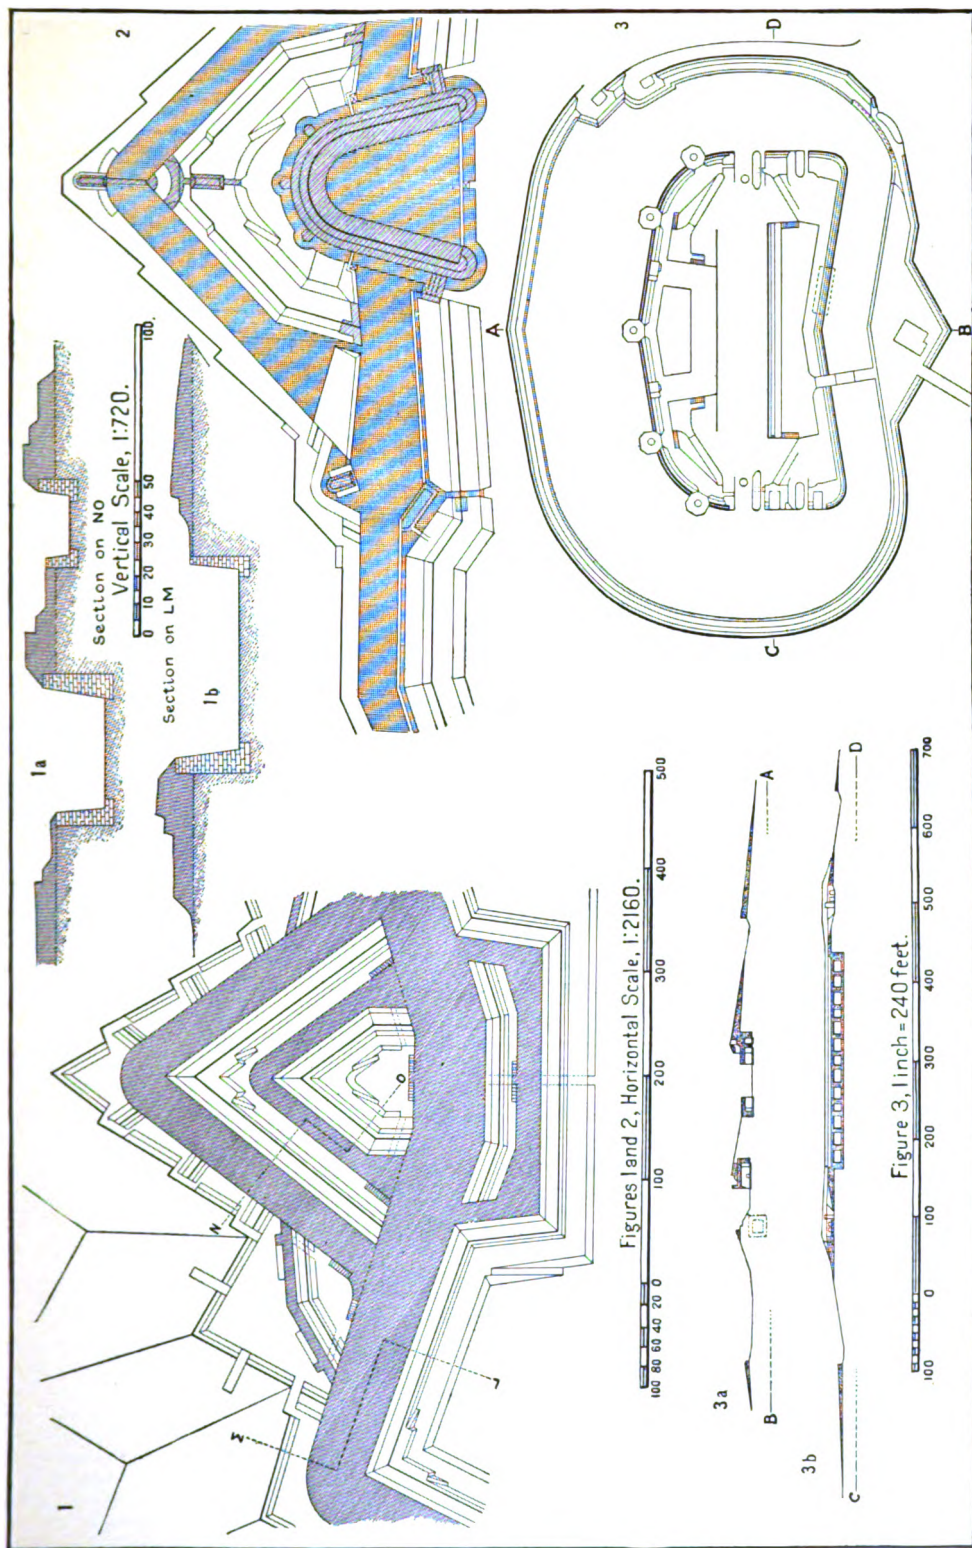

Soon afterwards ideas made their appearance which have since resulted in the development of simpler but stronger fortifications. Montalembert in France recognized the defects of the bastion system, and took the position that a siege had become primarily an artillery contest. He proposed a large use of casemates, which should protect the guns from covered fire. Instead of relying upon bastions in the salients for a flanking fire, he advocated the placing of low caponiers extending from the middle of each front into the ditch. His ideas did not meet with favor in his own country for many years, but were utilized and developed in Germany into what became known as the *polygonal system* of defense. In Sweden the habits and experience of the country led to the development of land fortifications similar to those of ships. The Swedes placed their guns in casemated batteries in two or more tiers for their land fortifications, as well as for coast defense. In Germany the bastion system had never met with great favor. It is here that we find the first extensive use of the polygonal system. The latter differs from the bastion system in the

omission of the bastions and the elongation of the main faces to the angles. It has advantages of saving the labor and ingenuity sometimes required to find suitable locations for the various sides of the bastions. The main faces of the fort adapt themselves more readily to the site. A ditch is provided in front of the enceinte, and a caponiere—that is, a casemated work—is pushed out from the middle of each face into the ditch, having a good flanking fire on the latter. It, in its turn, is protected from a distant fire by its relative lowness as compared with the covered way, or with a ravelin or other outwork placed in front of it. The system was used both for the construction of individual forts and of large enceintes surrounding great cities. Perhaps the most advanced example of its use in the enceinte of a large city is in the one constructed on the north, east, and south sides of Antwerp, Belgium. After the bastion and polygonal systems, what is known as the *tenaille* system was considered as the next most important type of construction. It consisted of a succession of redans joined to each other, giving an alternation of salient and reentrant angles. The main idea was that each face should flank the ground in front of the adjacent one. While stoutly advocated on theoretic grounds, the system was never largely applied in practice.

The many years of war at the beginning of the nineteenth century in Europe furnished a practical test of the fortification systems as they were in existence, and emphasized their defects. It was found that the inclosed enceintes were not large enough to hold a sufficient number of troops and supplies. They were too close to the cities to protect the latter from bombardment as the range of the guns increased. They exercised little influence outside of the reach of their own guns, as they did not contain room enough for a garrison larger than needed for their own service. It was found that unless a number of them surrounded the objective, the large armies simply ignored them by passing out of range of their guns.

The scope of the fortification was, therefore, enlarged by building, in advance of the main enceinte, small forts containing all the elements of defense. A line of these forts inclosed the ground necessary for the encampment of a large army. The new system was known as that of intrenched camps. As greater use was made of curved fire, it became desirable to expose less and less masonry in the scarp walls of the individual forts. In the development of the system of intrenched camps the different countries used different designs for the small forts. As the range of the artillery guns increased, it became evident that the fate of the siege depended less and less on the small, carefully arranged niceties which had been of such value in earlier days. The outer works became simpler and stronger. As the range of the artillery was increased still further by the introduction of longer and more accurate guns, and of shells containing explosives, additional bomb-proof cover in which the defending troops could remain when off duty became more important. It was becoming possible for the defender to compel the attacker to use his batteries at a range nearer to that of ordinary vision. It was found that the high forts and traverses furnished him with an excellent target, and this led to the

introduction of attempts to render the forts more nearly invisible. They were made lower, and their outer appearance harmonized more closely with the general surface of the ground. The fire of the guns was then found to attract the artillery fire of the attacker. The guns were taken out of the forts or redoubts and placed in batteries in the intervals between the forts, every attempt being made to conceal their actual position from the attacker.

The defense of Sebastopol in 1854 and 1855, the Civil War in the United States, and the Russo-Turkish War in 1877-78, showed the great value of works adapted to the site, simply and strongly built, with a view to meeting the latest phases of the attack. The more recent introduction of smokeless powder still further emphasized the advantage of invisibility in the works. The redoubts have now become essentially a place for the development of infantry fire supplemented by machine guns, and in some cases small rapid-fire guns. The use of the interior enceinte is becoming less general as the outer line of batteries becomes stronger.

It is apparent that the art of fortification developed slowly but gradually and progressively, for many centuries, but it has been within the last century and a half that radical changes have taken place. New conditions are constantly arising, and it is impracticable to indicate what the art will be in another century. An interesting account of the development of the old-type fortifications is given in Viollet-le-Duc, *Histoire d'une forteresse* (Paris, 1873). A full account of the historical development of the various systems of fortification will be found in *Woolwich Text-Book of Fortification*, part ii. (London, 1893).

MODERN PERMANENT LAND FORTIFICATION. The modern system of permanent land fortification consists of the use of forts d'arret and of intrenched camps. The former are individual

as a typical distance with modern artillery. The main conditions to be fulfilled in determining the distance are—that the works shall be so far to the front that the city cannot be bombarded from any position outside of them without coming under their fire; and that they shall be far enough out to provide sufficient room in their interior for the movements of the army to occupy the place. The accidents of the ground generally control their exact position. A work will be withdrawn or pushed out considerably, as the case may be, for the sake of securing a commanding position. The forts are now arranged essentially for a defense of infantry and machine-gun fire. They are placed at such distance apart along the circle as to enable them to be mutually supporting. Twenty-five hundred yards may be taken as a typical distance. Batteries for guns and howitzers are established in suitable positions in the intervals between the forts. The guns used rarely exceed seven inches in calibre; howitzers of the same or slightly larger calibre are used. The batteries must be so placed that the guns can bear directly on assaulting troops.

There are differences in the practice and views of engineers in the various European countries as to the exact functions of the forts and batteries. According to the practice of some, no guns larger than six-pounders are mounted in the forts. An example of a typical fort on these lines is shown on the accompanying plate (Fig. 3). Others provide for placing larger guns in the forts themselves. The use of iron armor is advocated by some as protection for such guns. Cupolas for 5.9-inch guns, 4.7-inch guns, and for 8.2-inch rifled mortars were established in the triangular forts built for the defenses of Bucharest. It seems to be acknowledged generally that it is no longer desirable to maintain large guns behind ordinary parapets in the forts. It has not yet

been settled, by war experience, whether it is better to keep them in the fort in cupolas, or to take them out, placing them in detached batteries; probably the consensus of opinion is in favor of the latter method. The former certainly has the disadvantage that the besieger in attacking a fort attacks both the infantry and artillery of the defense. In general, the individual forts are designed for a garrison of about one battalion of infantry, an example of a typical

FIG. 9. MODERN BATTERY.

1 and 3, ammunition and stores; 4 and 5, guns; 2, shelter casemate.

forts, complete in themselves, for small or medium-sized garrisons, and are placed for the protection of defiles, such as mountain passes, and of the frontier. (See **FRONTIER, MILITARY.**) The intrenched camp, which has taken the place of the old continuous enceinte as a fortification for cities and positions which it is desired to fortify in advance, consists primarily of an outer line of forts and batteries. The distance of this line from the city to be defended varies greatly in different places. Six thousand yards may be taken

battery being shown herewith.

It is intended to construct an infantry parapet in time of war across the intervals between the forts and batteries, sometimes running in front of them. Openings must of course be provided in this line to permit the egress of the troops making sorties. Arrangements are made for clearing the ground for some distance in front of the forts and batteries, and for the necessary accessories of the defense including such artificial means as towers or balloons, to assist in ob-

serving the enemy's movements; search-lights with which to illuminate his works at night; and for the running of telegraph lines, roads, and railroads. In many cases it is the practice instead of doing all these things in advance, to have projects prepared which include the most up-to-date plans for them. France, Germany, Russia, Austria, all have cities fortified on the above general lines. In many cases, however, the cities were first fortified earlier, and the present fortifications are modifications of the old ones, conforming as near as may be to the modern ideas. Most of the cities, in addition to being defended on the lines indicated, are provided with an interior enceinte, which is an additional security against surprise by any operation of the enemy's troops which may succeed in forcing the outer line. Many engineers are of opinion that an interior enceinte is no longer necessary; that if anything be placed inside it should be simply in the nature of a palisade or similar work, to prevent surprise. Still, the fact remains that most of the cities fortified as intrenched camps have also the enceinte.

PROVISIONAL FORTIFICATION.

Provisional fortification is the same in its function as permanent fortification. It is sometimes known as semi-permanent fortification, sometimes as deliberate fortification. It is used either to complete a system of permanent works which are not complete when war breaks out, or to defend a totally new position that might have been provided with permanent works had it been known definitely that an attack was to be made. Probably the most notable and extensive use of provisional fortification was in the defenses of Washington during the Civil War. The interior cities of the United States are not defended by permanent land works. It is generally believed that they are not required for coping with any foreign foe likely to attack the United States. During the Civil War, however, when the country divided into two parts, the two capitals being so close together as Washington and Richmond were, it became of the utmost importance that Washington should be provided with strong fortifications. In general, the forts were placed at intervals of about 1000 yards, and every prominent point was occupied by inclosed works, every important approach or depression of ground seen from the forts swept by field guns, and the whole connected by infantry trenches. The works were gradually constructed as the war went on; were carefully executed, provided with timber magazines for the ammunition, and with the necessary traverses, bomb-proof shelters, and other essential features. The success of the semi-permanent works of the Civil War, those used by the Turks at Plevna, and of some other works constructed only shortly before hostilities, has caused much attention to be paid to the value of this class of works.

BLOCKHOUSES. In some countries, as, for example, in the case of the Spanish in Cuba during the last insurrection, many towns were surrounded by blockhouses placed in commanding positions and within short distances of each other immediately outside the cities and towns. They were also used in connection with the construction of the famous Trocha, and in the vicinity of many sugar-mills and other valuable properties. Much ingenuity was displayed in the construction

of these houses, the system being developed probably more fully than ever before. They were sometimes frame structures, sometimes masonry, sometimes of boiler iron, and consisted of either one or two stories. Blockhouses are well adapted for use where the enemy from whom the attack is expected is not provided with artillery of sufficient power to demolish them. They were largely used by the British in South Africa.

BIBLIOGRAPHY. For fuller details on the subject of permanent land fortifications, the reader should consult Mahan, *Permanent Fortifications*, revised by Mercur (New York, 1887); Woolwich, *Text-Book of Fortification and Military Engineering*, part ii. (London, 1893); and Lewis, *Permanent Fortification for English Engineers* (Chatham, 1890).

COAST DEFENSE.

Coast defense, in its broadest sense, implies the defense of the coast against hostile attack. This may be made against fortified places by a hostile naval fleet, alone or in conjunction with a landing force; or, a landing may be attempted in an out-of-the-way place by a large army brought in transports convoyed by naval vessels. The latter will probably not be attempted unless the fleet protecting the transports is stronger than any fleet by which it will probably be attacked. Such an attack must be resisted by a stronger army on shore, and becomes, therefore, largely a problem in land warfare. Coast defense, which is discussed fully from the strategic and tactical point of view in another article (see **COAST DEFENSE**), as it is generally understood, has to do only with the resistance of attacks made by fleets. It generally resolves itself into an attack upon a harbor. This may be made for the purpose of securing control of the harbor as a base of operation and supply for the hostile fleet, or for the purpose of forbidding its use by the force of the country attacked; it may be to secure possession of naval docks, yards, and arsenals in the harbor, to prey upon commercial vessels, or to attack an inferior naval fleet which has taken refuge therein. The problem varies greatly, depending upon the population of the country, the occupations of its people, its resources, and the extent of its coast-line. France and Germany in the War of 1870-71 closed their ports for their own traffic as well as that of other countries, and carried on their war entirely on land, neither being in a position to attack the other by sea. England, being largely dependent upon other countries for her food-supply, is therefore bound, for the preservation of her existence, to protect her commerce on the seas. This policy imposes upon her the maintenance of an enormous navy, which was held for many years to be a sufficient protection against any attack that might be made on her shores. She has also, however, adopted the policy of fortifying her principal harbors. (The problem for the United States is at the other extreme. She has an enormous coast-line and a relatively small navy. It has always been her policy to fortify her principal harbors, seacoast cities, railroad terminals, and navy yards, and to leave her navy as free as possible for offensive operation. Guns afloat have an offensive advantage over guns ashore because of their mobility; but for defensive purposes the guns on shore have corresponding advantages over those afloat. They are mounted

much more economically, gun for gun, can be fired farther and more accurately, and cannot be tricked away from the place they are intended to defend. Under modern methods of mounting, they present an extremely small exposure to the enemy, whereas the entire ship of the enemy becomes their target.)

HISTORICAL DEVELOPMENT. At the outbreak of the Revolutionary War few ports in the United States had been provided with fortifications; such as had been built were small and weak earth forts. Throughout the early years of the war England's ships were comparatively free to come and go as they pleased, a notable exception being the instance of the repulse of the British fleet by a small fort on Sullivan's Island, Charleston Harbor. Between the Revolutionary War and the War of 1812 some attention was given to the necessity for fortifying the coast, and a few defensive works were built. The best known of these to-day are Fort Columbus (q.v.) and Castle William, on Governor's Island, New York Harbor, which have endured to the present date, although now of little defensive value. During the War of 1812 the English blockaded New York and Boston, but were not able to occupy them; but the damage and demoralization caused by their depredations in Long Island Sound and Chesapeake Bay, to which was added the damage wrought on the city of Washington, produced a deep impression on the public mind as to the necessity for a regular system of fortification. Shortly after this war the general subject was carefully studied by the Board of Engineers of the Army, and work continued to be carried on under the comprehensive system which they inaugurated until the time of the Civil War. Many of the principles which they formulated are still applicable, the general principles underlying their plans, as stated, being as follows:

"The means of defense for the seaboard of the United States, constituting a system, may be classed as follows: First, a navy; second, fortifications; third, interior communications by land and water; and fourth, a regular army and well-organized militia. Fortifications must close all important harbors against an enemy, and secure them to our military and commercial marine; second, must deprive an enemy of all strong positions where, protected by naval superiority, he might fix permanent quarters in our territory, maintain himself during the war, and keep the whole frontier in perpetual alarm; third, must cover the great cities from attack; fourth, must prevent as far as practicable the great avenues of interior navigation from being blockaded at their entrances to the ocean; fifth, must cover the coastwise and interior navigation by closing the harbors and the several inlets from the sea which intersect the lines of communication, and thereby further aid the navy in protecting the navigation of the country; and sixth, must protect the great naval establishments."

Reference has been made to Montalembert and his influence upon the art of fortification in Europe. He had attracted particular attention to the utility of casemates, which, as stated, were from that time forward freely used for many years in the flank defense of land fortifications. They were also deemed particularly applicable to seacoast works, and were used for this purpose in France, England, and Sweden. The first

VOL. VIII.—6.

prominent example of their use in this country was in old Castle William, which stands as a type of the masonry seacoast fortress of the early part of the nineteenth century. Where used for land fortification, the condition had been imposed that the masonry should not be exposed to the fire of guns, as its destruction was considered to be only a matter of time. The conditions covering the naval attacks of the period in question were, in certain respects, different. The ships were of wood and carried a large number of guns. The general idea of fighting consisted in bringing as many guns as were needed on land into a comparatively small space where the channels were narrow. The attack, instead of being a matter of weeks, as in land fortifications, was expected to be a matter of hours. The wooden sides of the ships were particularly vulnerable, and it was believed that by putting the shore guns behind walls of stone they would be in position to fire much longer than those on ships. The casemate especially lent itself to this style of defense, in that by using it the guns could be placed tier on tier, and even at narrow and restricted sites many guns could be emplaced.

The guns were usually mounted one to each casemate. The scarp wall in front was given a thickness designed to resist the projectiles then in use on ships during the probable time of an engagement. In the latter works this thickness was about eight feet. The walls were thoroughly braced by the sides and tops of the casemates. Much study and attention was given to details, gradual improvements being made permitting a reduction in the size of the embrasures through which the guns were fired, and an increase in their angle of fire. The guns were arranged in the more recent works for a traverse of 30° each way, making a total of 60°. This fact led to the construction of works in the shape of a hexagon. Guns on adjacent faces were enabled to fire parallel to each other when traversed to their extreme position, thus preventing the existence of a dead angle along the capital of the salients. Some of the works were of brick; others of stone. Most of them were provided with a land defense of some nature to assist the garrison in resisting an attack by a landing party. Many of the works are well known, such as Fort Warren in Boston Harbor; Fort Wadsworth, New York Harbor; Fort Sumter, Charleston; and Fort Monroe, Hampton Roads.

About the time of the Civil War, however, there came radical changes in naval ordnance and attack. Rifled guns were introduced and ships were covered with iron. (See GUNS, NAVAL.) The wonderful effect of rifled-gun fire on masonry was shown in the breaching of Fort Pulaski during the Civil War by the breaching batteries established on land by the Federals under General Gillmore. As the war progressed, the Confederate engineers found it desirable to occupy some positions on the seacoast not already fortified. This was done with provisional works of sand and timber. The magnificent resistance made by a work of this character, Fort Fisher, near the mouth of the Cape Fear River, assisted in attracting attention to the value of sand as a defense. Steam had by this time been generally introduced into navies, affording ships more latitude in taking up positions.

These changes led to the introduction of armor in many cases for the protection of forts in Europe, it being argued that if good for the protection of ships' guns, it was good for the protection of forts, and that the latter could use as much of it as needed, whereas the ships were limited by the weight they could carry. In the United States the value of sand as a protection was appreciated. Immediately after the Civil War earthen batteries were built at important positions for mounting some of the smooth-bore guns then available. About 1875, appropriations ceased, and little work except of repair nature was done on the fortifications of the United States until 1890. By this time the rapid strides which had been made along the lines already indicated—that is, the introduction of steam into navies, the addition of improved varieties of armor, and the increase in accuracy and power of rifled guns—rendered the system of fortifications already built practically obsolete, except for certain minor purposes.

MODERN DEVELOPMENT OF COAST DEFENSES IN THE UNITED STATES. The War Department having invited the attention of Congress to the condition of the national defenses, and to the necessity for doing something to place them in better condition, the matter was taken up, and an act was passed in 1885 providing for the appointment of a board to examine and report at what ports fortifications or other defenses were most urgently required, the character and kind of defenses best adapted for each, with reference to armament and the utilization of torpedoes, mines, or other defensive appliances. The board, since known as the Endicott Board, consisted of the Secretary of War, the Chief of Ordnance, and Chief of Engineers of the Army, one other officer from each of these corps, two naval officers, and two prominent civilians. Their report, which was submitted the following year, forms the basis of the present system of fortifications in the United States. As a result of their study they recommended that defenses should be provided for the following ports, which were arranged in the order of their relative urgency: New York; San Francisco; Boston; the Lake Ports; Hampton Roads; New Orleans; Philadelphia; Washington; Baltimore; Portland, Maine; Rhode Island ports in Narragansett Bay; Key West; Charleston, S. C.; Mobile; New London; Savannah; Galveston; Portland, Oregon; Pensacola, Fla.; Wilmington, N. C.; San Diego, Cal.; Portsmouth, N. H.; Cumberland Sound; Kennebec River, Maine; New Bedford, Mass.; Penobscot River, Me.; and New Haven, Conn.

The defenses as to character and kind, with reference to armament, should be fixed and floating, one or both, according to locality, and armed with powerful cannon needed to repel attack from the most formidable ships. The shore batteries were to be armored turrets, revolving or fixed, armored casemates and emplacements in barbette. Earthen parapets and traverses, sometimes arranged with core of concrete or rubble masonry to add resistance to shock, were to be used for barbette batteries.

The Civil War had developed the value of the submarine mine as an element of defense. The Endicott Board laid stress on this element as follows: "It is not generally considered possible to bar the progress of an armored fleet by the

mere fire of the battery; some obstruction sufficient to arrest the ships within effective range of the guns is necessary. The kind of obstruction now relied upon is the torpedo in the form of a submarine mine, and, except in special cases, exploded by electric currents, which are so managed that the operator on shore can either ignite the mine under the ship's bottom or allow the ship to explode it by contact. In deep channels the submarine mines are buoyant; in comparatively shallow waters they are placed upon the bottom; the object in both cases being to touch or nearly approach the hull of the vessel. Submarine mines are not accessories of the defense, but are essential features whenever they can be applied. Bomb-proof operating rooms and tunnels for the conveyance into the water of the electric cables are necessary parts of the system, and must be constructed in advance of the occasion for their use. . . . Heavy batteries and submarine mines are correlative terms of a good defense from the shore. Without powerful guns in the defense the armored ships of the enemy would proceed deliberately to the removal of the mines, either ignoring or silencing the fire of the works, and without the aid of the mines the enemy's vessels could not generally be prevented from running past the batteries."

Special batteries of guns were to be installed for the defense of the lines of mines against the attempt of unarmored or light-armored boats to countermine or grapple for their attachments. When practicable, every mine-field should be commanded by electric search-lights, so that the enemy's attempts at night to tamper with the mines may be detected and rendered abortive.

The necessities of each of the above harbors were studied in the light of the best information available, and the board made definite recommendations as to the number of guns and mortars, submarine mines, electric lights, and local floating defenses necessary for each harbor.

The first fortification appropriation act designed to carry out the recommendations of the Endicott Board was approved September 22, 1888. This act created the Board of Ordnance and Fortification, and made appropriations for commencing the manufacture of modern seacoast ordnance, but made no provision for the construction of any batteries. The first appropriation for the construction of gun and mortar batteries was contained in the act of August 18, 1890, since which time appropriations of varying amounts have been made regularly each year for carrying forward the adopted scheme of coast defense—for the manufacture of ordnance, or the construction of batteries, and for the necessary torpedo defenses.

The defensive details for each locality have been carefully elaborated from time to time by the Board of Engineers in projects which have received the formal approval of the Secretary of War prior to the actual beginning of any work. Up to 1902 projects for permanent seacoast defenses were adopted for thirty-one localities in the United States, as follows: Penobscot River, Maine; Kennebec River, Maine; Portland, Maine; Portsmouth, N. H.; Boston, Mass.; New Bedford, Mass.; Narragansett Bay, R. I.; eastern entrance to Long Island Sound; New York, N. Y.; Philadelphia, Pa.; Baltimore, Md.; Washington, D. C.; Hampton Roads,

Va.; entrance to Chesapeake Bay at Cape Henry; Wilmington, N. C.; Charleston, S. C.; Port Royal, S. C.; Savannah, Ga.; Saint John's River, Fla.; Key West, Fla.; Tampa Bay, Fla.; Pensacola, Fla.; Mobile, Ala.; New Orleans, La.; Sabine Pass, Tex.; Galveston, Tex.; San Diego, Cal.; San Francisco, Cal.; mouth of Columbia River, Oregon and Washington; Puget Sound, Wash.; Lake Champlain.

Of the existing projects for the United States, as enumerated above, many have from time to time been revised to keep pace with the changes in ordnance and ships' armament and construction. At the time the scheme of coast defense was formulated by the Endicott Board, the rapid-fire gun was in its infancy, and ships were characterized by their extremely heavy armament and great thickness of armor. With the rapid development of this weapon and the increase in the resisting powers of armor by means of the Harvey and Krupp processes, there has followed a material change in ship construction, necessitating corresponding changes in the details of coast defenses. In accordance with the recommendations of the Endicott Board, the earlier detailed projects contemplated mounting a considerable number of the heaviest guns at the more important harbors in armored works. The tendency toward a reduction in calibres of heavy guns, coupled with the adoption of a disappearing carriage (see illustration under *ORDNANCE*) for the 12-inch gun, has, up to the present time, rendered armored defenses unnecessary, and the United States has thus far not embarked upon the construction of armored casemates and turrets, to which many European governments stand committed for their land defenses. Although rapid-fire guns were proposed in the earlier projects, no definite numbers or calibres were assigned until 1896, since which time nearly all of the earlier projects have been subjected to revision, resulting in the incorporation of a definite programme as to the rapid-fire armament, a reduction in the number and calibre of the heavy guns, a reduction in the number of mortars, and the general elimination of armored defenses. These revisions have resulted in marked economies, without any sacrifice to the defensive requirements, and they will be continued as changes in ordnance and ships or other causes may render them desirable.

While the inauguration of the modern system of seacoast defenses for the United States dates from 1890, when the first appropriation for constructing gun and mortar batteries was made, it was not until 1896 that Congress began making appropriations commensurate with the magnitude of the undertaking. Stimulated by the larger appropriations of recent years and the War with Spain, the seacoast defenses of the United States were, in 1902, eleven years after the actual commencement of the work, about 50 per cent. completed. Twenty-five of the principal harbors of the United States possess a sufficient number of heavy guns and mortars mounted to permit of an effective defense against naval attack, and considerable progress has been made toward the installation of an adequate rapid-fire armament, which is now a matter of first importance. Most of the heavy guns are now in position, a considerable portion of the light rapid-fire emplacements and some of the rapid-fire guns

are completed, while a beginning has been made of inaugurating the systematic installation of search-light apparatus for night defenses. All torpedo material necessary to enable a quick and effective defense to be made is in store at each harbor for which torpedo defenses are at present projected. With few exceptions, all harbors are now equipped with torpedo storehouses, cable-tanks, and mining casemates.

Extensive torpedo experiments, with a view to improvements in the adopted system, have been carried on at the United States Engineer School and elsewhere, and such experiments, as well as inventions or ideas submitted by individuals, are considered by a board of officers known as the Board on the Torpedo System.

FEATURES OF CONSTRUCTION. Large direct-firing guns are now usually mounted singly, with traverses between them to protect them from enfilade by distant hostile fire, and to limit the destructive effects of projectiles landing in adjacent emplacements. The distances between the guns vary with their size and with the nature of the ground. Where possible, in the case of the larger guns, it is rarely less than 100 feet. Mortars for indirect firing are mounted in pits containing four mortars each. The first requirement for the mounting of a modern gun is a proper foundation from which the gun may be fired, and which will permit it to traverse freely and accurately. While modern guns, as already indicated, have increased remarkably in power in recent years, the weight of the gun proper has not increased in the same ratio. The usual precautions governing the design of foundations for heavy structures of course hold, in the case of guns and mortars, in proportion to their weight. The great increase in power of modern guns has, in addition, rendered corresponding precautions necessary to prevent the gun and carriage from being overturned by the recoil of the piece. Provision is made for offsetting the strain transmitted to the foundation by the weight and distribution of the material of the latter. In the case of some of the high-power English guns, this has resulted in the construction of practically solid concrete bases 25 feet in diameter and 10 feet deep. The traverse circle of the carriage is connected with this base by steel bolts two inches in diameter and extending nearly to the bottom of the base of concrete. A loading platform of suitable dimensions on which the men can work while loading the gun is provided in the rear of the gun. As modern ordnance is loaded at the breech instead of at the muzzle, as was the case for most ordnance used even so recently as during the time of the Civil War, the service of the gun is considerably expedited, and the cannoners are enabled to work in more safety under the cover of the parapet. The latter is a matter of considerable importance, and is placed in front of the gun, connecting with the traverses on the side. Where the gun is mounted on a disappearing carriage its muzzle projects over the parapet only in the firing position and recoils to a position in rear of the parapet for loading. If mounted on a barbette carriage, the gun stands permanently with its muzzle projecting above the parapet. (See illustrations in articles *ORDNANCE* and *COAST ARTILLERY*.) The thickness which should be given the parapet is an open question among engineers. The rule laid down by some

of the best authorities is that it should be 50 per cent. thicker than the greatest penetration of any projectile liable to strike it. The modern method of constructing parapets is to make them of a mass of sand supported by thick retaining walls of concrete immediately in front of the gun. Experience has shown that projectiles striking in the front slope of a thick mass of sand thus backed will usually be deflected upward and pass out through the superior slope of the parapet, doing little damage to it, as the sand drops back approximately into place. Lewis gives the thickness of the concrete retaining wall immediately in front of the gun for English emplacements for high-power guns at from 10 to 15 feet. The superior or upper slope, both of concrete and earth, have a slight slope to the front. The front slopes run off into the natural surface of the ground, and in this and other ways the concealment of the battery is secured in order to make it a difficult target for the enemy on the water.

The main magazine for a fort should consist of a building or buildings at suitable places convenient of access, in which powder in bulk, blank cartridges, shell, etc., may be stored. The service magazine immediately at the gun emplacement should have a capacity for 200 rounds of powder stored in cases and served to the lift by hand, 100 rounds of shell and shrapnel, and 100 rounds of armor-piercing shell served by overhead trolleys to the lifts or cranes. At the time of the Civil War in the United States projectiles had not yet attained a weight too great to be handled by hand by two men. Now the largest of them weigh half a ton, and special appliances in the way of trolleys and wheeled trucks must be provided for handling them expeditiously. Magazines and shell-rooms are placed where most convenient in view of the nature of the ground and the positions of the guns. Frequently they are in the traverses between guns. In view of the disastrous effects that may result from the explosion of a magazine, special precautions are taken to exclude hostile projectiles from it. This is accomplished by placing it in a relatively lower position than the gun, and giving its walls an ample thickness of masonry and earth covering. Moisture is injurious to powder, and although the latter may be ordinarily kept in waterproof cases, many precautions are taken to exclude dampness from the magazines. In view of the fact that the service magazines are of necessity near the coast, and that the air around them frequently contains much moisture, the problem is a difficult one. Careful attention is given to drainage, so that the surface water may be carried off as rapidly as possible. Air-spaces and French drains are provided to intercept water penetrating the mass of the cover. The masonry walls are made as tight as possible and waterproofed. By these means the infiltration of water is prevented. Condensation will, however, occur when damp air is admitted to the magazine and strikes the walls and material at a temperature below its dew-point. The prevention of condensation is a problem of relative heat and cold, and is usually met by attempts at careful regulation of the ventilation, admitting air so far as possible only at times when it is the driest. The walls are also sometimes lined with brick, with a view to absorbing water which may be deposited on them if the

magazines must be opened for a short time at unfavorable periods.

In a modern fortification there are many elements to be considered. Living-rooms for the cannoneers are sometimes built in the emplacements. Provision must be made for lighting the emplacements, magazines, etc., in case of action at night. This was formerly done by means of lamps, but recently in the United States standard specifications have been prepared by a board of engineer officers for electric light and power installations at seacoast batteries. Lookouts for the observation of gun-fire must be built in the flanks of the emplacements, and stairs and ramps provided where necessary in the emplacement for free and easy communication between its various parts.

In the United States the regulations concerning the promulgation of information relative to the permanent works of defense are quite explicit, and forbid the publication of many interesting and significant facts concerning the more modern fortifications. A paragraph in the Army Regulations provides that, "The taking of photographic or other views of permanent works of defense will not be permitted. No written nor pictorial descriptions of these works will be made for publication without the authority of the Secretary of War, nor will any information be given concerning them which is not contained in the printed reports and documents of the War Department." Accordingly, for descriptions of these fortifications, recourse must be had to these reports. The principal ones containing information on the subject are the reports of the chief of engineers of the army, including the reports of the district constructing officers, and the Drill Regulations for Coast Artillery. For the best work of reference, aside from these official sources, consult Abbot, *Defense of the Seacoast of the United States* (New York, 1888). In England, several excellent works on this subject have been prepared for general sale, among which may be mentioned Clarke, *Fortification* (London, 1890), and the various Chatham manuals. See, further, the various articles in this Encyclopædia dealing with military and naval subjects. The use and disposition of troops is discussed under TACTICS, MILITARY; the methods of coast defense are treated under that title; while the various weapons used are described in such articles as ARTILLERY; ORDNANCE; TORPEDOES; COAST ARTILLERY; FIELD ARTILLERY; GUNS, NAVAL; HORSE ARTILLERY; RAPID-FIRE GUNS; ARMOR PLATE; PROJECTILES, etc.

FORTIFICATIONS, ATTACK AND DEFENSE OF. The construction and nature of fortifications have been considered under FORTIFICATION; the present article will discuss the tactics involved in their attack and defense. The subject in its essence is more appropriately treated under SIEGE AND SIEGE WORKS; but in some respects the tactics of field artillery (see TACTICS, MILITARY), with certain necessary modifications, find application, and the latter are considered here. The attack of a fortification is a planned attack on a prepared position; but the field material is supplemented by siege artillery and engineer work. The attack and defense proceed as in the field; the infantry of the attack occupies the foreground; the siege guns are placed in position under its protection, the guns of the defender

are silenced, and the nearer means of defense are destroyed. Meanwhile the infantry moves gradually forward, and finally takes the position by storm. On both sides the work is carried on with energy, to prevent the enemy from having any rest in his work.

The cavalry first incloses the fortification and remains in observation; the infantry then occupies its position deliberately, directing its forces against at least two of the fronts of the fortification, in order to deceive the enemy, preparing against surprise by means of very strong outposts, especially on the front, selected for actual attack, and the latter must generally intrench themselves. As soon as the guns of the enemy are silenced, the works of the enemy are destroyed by the heavy artillery. The infantry can only advance under cover, consequently the outposts are first advanced, and then their previous position is improved during the night to serve as an infantry position, not by running continuous lines (parallels), but by constructing groups of fortifications previously laid out by the engineer officers. Where the infantry cannot be brought forward under natural cover, zigzag approaches must be run. If the infantry position is too far to the rear for the final assault, another, and often a third, must be prepared farther to the front. If the heavy artillery fails to destroy the enemy's works flanking the ditch, the attacker will be forced to begin the tedious engineer attack by the sap. Otherwise the assault is ordered, and is preferably begun in the early morning, and the attack is directed on a broad front. Several false attacks are made at the same time, to deceive the enemy if possible.

The same principles apply in the defense, activity and the offensive being predominant. In the early stages the infantry must go out in the open to attack, but in the later the defense becomes purely passive. See SIEGE AND SIEGE WORKS.

FORTINBRAS. The Prince of Norway, in Shakespeare's *Hamlet*. He covets the lands lost by his father to Denmark, and finally makes an invasion into the latter kingdom. He arrives on the scene in the last act, in time to see Hamlet's death and claim the realm. The part is usually omitted from acting versions.

FORT INDEPENDENCE. A fortification on Castle Island, Boston Harbor, Mass., built on the site of the former Castle William.

FORTIS, *for'tēs*, Abbe GIOVANNI BATTISTA (1741-1803). An Italian traveler and naturalist, born in Padua. He became an Augustinian monk, but was unfitted for a monastic life, and spent his time in travel, studying the natural history of the regions he journeyed through, and recounting his adventures and investigations in writing. His publications include: *Saggio d'osservazioni sopra l'isola di Cherso ed Osero* (1771); *Viaggio in Delmazia* (1774), his best-known work, containing an interesting collection of the folk-songs of the Serbs and Croats; *Della valle vulcanico-marina di Roma* (1778); *Versi d'amore e d'amicizia* (1783); *Mémoires pour servir à l'histoire naturelle et principalement à l'oryctographie de l'Italie, etc.* (1802).

FORT JACKSON. A fort on the right bank of the Mississippi, 78 miles below New Orleans, famous for its resistance to Farragut's fleet and its final capture by the Federals in 1862. It was built in 1824-32, and was enlarged and re-

paired in 1841. Together with Fort Saint Philip, on the opposite bank, a half-mile above, it defends New Orleans from maritime attack. After the passage of the South Carolina ordinance of secession, on December 20, 1860, the State authorities of Louisiana seized these forts, strongly fortified them, and stationed a fleet above. In the spring of 1862, a Federal expedition was organized against New Orleans, and the Confederates, soon hearing of it, greatly strengthened the two forts. The expedition, under the command of Captain Farragut, arrived at the mouth of the Mississippi in March, and on April 18th the powerful mortar flotilla under Commander D. D. Porter opened fire with terrible effect upon the forts. At 2 A.M. on the 24th Farragut's fleet started in single line up the river, and, in the face of a tremendous fire from the two forts and from a Confederate fleet, succeeded in passing first Fort Jackson and then Fort Saint Philip. Soon afterwards the city was occupied by Federal troops, and on the 28th both Fort Jackson and Fort Saint Philip capitulated to Commander Porter, who had remained below. The two forts were under the command of Brig.-Gen. J. K. Duncan, and were garrisoned by about 700 men each. Fort Jackson was under the immediate command of Lieut.-Col. Edward Higgins. The loss of the Federals was 37 killed and 147 wounded, while that of the Confederates is not definitely known. Consult: Johnson and Buel (editors), *The Battles and Leaders of the Civil War*, vol. ii. (New York, 1887); Mahan, *Admiral Farragut* (New York, 1892); and Nicolay and Hay, *Abraham Lincoln: A History*, vol. v. (New York, 1890).

FORT KEOGH, *kē'ō*. A United States military post in Montana, established in 1876, and comprising a reservation of 57,600 acres. There are a post-office and railroad and telegraph station at the post, which is situated on the Northern Pacific Railroad, 746 miles from Saint Paul, Minn. It was named for Capt. Myles Keogh, Seventh United States Cavalry, one of the victims of the Custer massacre. There are quarters for 27 officers and 300 men, and stables for 200 horses.

FORT LAFAYETTE, *lä'fä-ët'*. A fort on the Long Island shore of the Narrows, New York Harbor, in front of Fort Hamilton.

FORT LEAVENWORTH. A United States military post in Kansas, established in 1827 by Colonel Leavenworth, U. S. A. The reserve comprises 6899 acres, all but 939 acres (timber) being on the west side of the Missouri River. It is about 500 miles above the junction of the Missouri with the Mississippi, on the Kansas City, Wyandotte and Northwestern and Missouri Pacific railroads. There are quarters and barracks for 100 officers and 1500 men, with stables for 1000 animals. The station of the general service and staff college (postgraduate), and a garrison comprising a due proportion of cavalry, artillery, infantry, and engineer troops, are located at the post, which has both post-office and telegraph station.

FORT LEE. A fort formerly situated in Bergen County, N. J., on the west bank of the Hudson River, along the lower Palisades. At the old fort here, opposite 160th Street, New York City, General Greene, with 2000 troops, narrowly escaped capture by a force of 5000

British under Cornwallis, on November 20, 1776. Warned just in time, he hastily evacuated the fort and retreated with Washington across New Jersey, leaving behind all his provisions and military stores.

FORT LO'GAN. A United States military post, established in 1887, and comprising a reservation of 640 acres, three miles from Denver, Colo. There are quarters and stables for a squadron of cavalry.

FORT McALLISTER. A strong earthwork, erected by the Confederates during the Civil War on Genesis Point, on the right bank of the Great Ogeechee River, six miles from Ossabaw Sound, and 12 miles south of Savannah, Ga. Early in 1863 Admiral Du Pont, wishing to give the recently constructed monitors a preliminary trial before using them against Fort Sumter (q.v.), ordered the *Montauk* (Commander J. L. Worden), assisted by the gunboats *Seneca*, *Wissahickon*, *Dawn*, and *Williams*, to attack Fort McAllister. Bombardments occurred, without serious damage either to the fleet or the fort, on January 28th and February 28th, the Confederate privateer *Nashville*, which had grounded near the fort, being destroyed on the latter day. On March 30th an eight-hour attack, with little effect, was made by the monitors *Passaic*, *Patapsco*, and *Nahant*, under Commander Drayton. Finally, on December 13, 1864, the fort was assaulted and captured by General Hazen's division of General Sherman's army. This was the concluding operation of Sherman's march to the sea, and led to the surrender of Savannah several days later. Consult: Ammen, *The Atlantic Coast* (New York, 1883); Johnson and Buel (editors), *Battles and Leaders of the Civil War*, vol. iv. (New York, 1887); and Sherman, *Memoirs*, vol. ii. (New York, 1875).

FORT McHENRY. A United States military post, established in 1794. It occupies a reservation of 35 acres, on Whetstone Point, Patapsco River, Md. The post-office and telegraph station are Baltimore, Md., from the centre of which city it is distant three miles. Its site was first occupied for military purposes in 1775. In 1794 it was established as a permanent fortification, and was named after James McHenry, one of Washington's private secretaries during the Revolution, and Secretary of War, 1798. In September, 1814, it successfully withstood a bombardment by the British fleet under Admiral Cockburn. It was this attack which suggested to Francis S. Key his famous ode, "The Star Spangled Banner." During the Civil War the fort was used as a rendezvous and military prison. In 1902 there was an artillery garrison of four companies. Forts Armistead and Carroll are suburbs.

FORT MA'CON. A fort commanding Beaufort Harbor, N. C., taken by Federal land and naval forces on April 26, 1862.

FORT McPHERSON. A United States military post, established in 1867 as McPherson Barracks, and now located on a reservation of 236 acres, acquired by the United States Government in 1886, and situated four miles south of Atlanta, Ga. There are post-office and telegraph stations at the post. There are quarters for four companies of infantry.

FORT MADISON. A city and the county-seat of Lee County, Iowa, 18 miles southwest of Burlington; on the Mississippi River, and on the Atchison, Topeka and Santa Fé and the Chicago, Burlington and Quincy railroads (Map: Iowa, F 4). It is the seat of the State penitentiary, and has the Catermole Memorial Library, and several public parks. A fine railroad and wagon bridge crosses the river at this point. There are pork-packing houses, shops of the Atchison, Topeka and Santa Fé Railroad, foundries and machine-shops, flour and saw mills, farm-implement works, wrapping-paper mills, car-wheel works, and manufactures of automobiles, buttons, boots and shoes, chairs, boxes, tools, etc. Fort Madison was settled in 1832, on the site of a fort dating from 1808, and was incorporated as a town in 1836. The government is administered by a mayor, elected every two years, and a unicameral council. Population, in 1890, 7901; in 1900, 9278.

FORT MEADE. A United States military post, established in 1878, and occupying a reservation of 7842 acres, in Meade County, near Sturgis, S. D., on the Fremont, Elkhorn and Missouri Valley Railroad. There are quarters for 25 officers and 500 men, and stables for 600 horses. It was improved and modernized in 1902.

FORT MEIGS, mēgz. A former fort at the Maumee Rapids, in northwestern Ohio, famous for its defense by the Americans against the English and Indians during the War of 1812. General Harrison had established his advanced post here after the 'Massacre of the River Raisin' (see FRENCHTOWN), and on May 1, 1813, the British General Proctor, at the head of more than 2200 men (including about 1500 Indians under Tecumseh), began an attack, which lasted, with little intermission, until the 5th. On this day an American reinforcement of about 1100 men, under Gen. Green Clay, arrived, and a battle, or series of battles, ensued, without decisive result. Proctor, however, seeing the hopelessness of further attack, and being considerably weakened by Indian defections, withdrew from the vicinity of the fort on the 9th. Consult: Dawson, *Battles of the United States* (New York, 1858); and Lossing, *Pictorial Field Book of the War of 1812* (New York, 1868).

FORT MERCER. An abandoned fort at Red Bank, N. J., on the Delaware River, which during the Revolutionary War formed one of the defenses of the city of Philadelphia. Immediately after occupying Philadelphia, in 1777, Sir William Howe (q.v.) perceived the necessity of securing Forts Mercer and Mifflin, in order to open communication by water with New York, and thus prevent the forcing of his army into a state of siege. Late in October, accordingly, a force of about 2500 picked men, mostly Hessians, under Colonel Donop, was sent against Fort Mercer, and a supporting fleet was ordered up the river. On the 22d the Hessians attacked with vigor, but were fiercely beaten back by the small American garrison, numbering 300, under Col. Christopher Greene, and were finally forced to withdraw. After the capture of Fort Mifflin (q.v.), Fort Mercer was abandoned (November 20th) by the Americans, and soon afterwards was destroyed by the British. Consult: Dawson, *Battles of the United States* (New York, 1858); and

Lowell, *The Hessians in the Revolution* (New York, 1884).

FORT MIFFLIN. A fort on Mud Island, in the Delaware River, near the mouth of the Schuylkill River. It is one of the defenses of the city of Philadelphia, and in American history is well known for its siege and capture by the British during the Revolutionary War. Together with Fort Mercer (q.v.), on the New Jersey shore, it controlled the approach by water to Philadelphia, and when that city was captured by Sir William Howe, in 1777, shut the British off from communication with their fleet, and obstructed the passage of supplies. On October 23d it was bombarded for several hours, but with little effect, by a British fleet, assisted by a land battery, an American fleet (called the Pennsylvania Navy), under Col. John Hazelwood, coöperating with the fort, which was then garrisoned by only 300 men, under Col. Samuel Smith. Finally, the British erected a strong battery on Province Island, and greatly reinforced their fleet. On the 10th of November they again attacked, and after an almost constant bombardment for six days the Americans evacuated the fort and crossed over to Fort Mercer. An extended account of Fort Mifflin during the Revolution is given in Wallace, *An Old Philadelphian*, Colonel William Bradford (Philadelphia, 1884). Consult also Dawson, *Battles of the United States* (New York, 1858).

FORT MIMS, MASSACRE OF. An Indian massacre on August 30, 1813, during the Creek War, at Fort Mims, a temporary stockade 35 miles north of Mobile, Ala. On the outbreak of the war, 553 men, women, and children had assembled here for protection, under the command of Dixon Bailey; but were surprised by a greatly superior force of Indians, under the half-breed Weathersford, at noon on August 30th, and, though they offered brave resistance, all of them were killed, except 15 who escaped, and a few negroes and half-breeds, who were taken prisoners. Consult: Pickett, *History of Alabama*, vol. ii. (Charleston, 1851); Lossing, *Field Book of the War of 1812* (New York, 1869); and Dawson, *Battles of the United States* (New York, 1858).

FORT MONROE. A United States military post, situated at Old Point Comfort, Elizabeth City County, Va., and commanding the entrance to Hampton Roads. There is a post-office and telegraph station at the post, which includes a reservation of 282 acres. The station of the Artillery School (postgraduate), with quarters for 50 officers and 600 men, is located here. For two years after the close of the Civil War Jefferson Davis (q.v.) was imprisoned here.

FORT MONTGOMERY. A fort on the Hudson, near West Point, intended to close the river against the British fleet in 1777.

FORT MORGAN. A United States military post in Alabama, occupying a reservation of 322 acres on Mobile Point, the eastern entrance to Mobile Bay, 33 miles from Mobile. The post-office is Mobile, and there is a telegraph station at the post. The garrison in 1902 consisted of two companies of coast artillery. See **MOBILE POINT**.

FORT MOULTRIE, mól'trī. A fort on Sullivan's Island, at the entrance to Charleston Harbor, notable for its defense against the British in

the Revolutionary War. In the summer of 1776 Sir Peter Parker, with a fleet, and Sir Henry Clinton, with a force of British regulars, proceeded to Charleston Harbor for the purpose of taking Charleston, and of using that place as a base of operations against the Southern Colonies. A total American force of about 6500 had assembled for the defense of Charleston, of which 435, under Col. William Moultrie, were stationed in an unfinished fort, then known as Fort Sullivan, at the eastern end of Sullivan's Island. On June 28th Sir Henry Clinton took up a position on the sand-bank near Sullivan's Island, with the intention of crossing over and making a land attack. Meanwhile Sir Peter Parker, with his fleet, made a vigorous attack on the fort; but, after an artillery duel lasting almost ten hours, was forced to withdraw. Owing to the depth of the shoals, through which he had expected to reach Sullivan's Island, Clinton was detained on the sand-bank, and virtually took no part in the engagement. The effect of the victory was to insure the Southern States from invasion for almost two years. Subsequently the name of the fort was changed to Fort Moultrie. On May 7, 1780, a short time before the capture of Charleston by the British, the fort was forced to surrender.

Immediately before the outbreak of the Civil War, Fort Moultrie was occupied by the United States garrison assigned for the defense of Charleston Harbor; but on December 26, 1860, the fort being virtually unprotected from land attack, and hostilities appearing imminent between the Federal and State forces, Major Anderson removed the garrison to Fort Sumter (q.v.). A detachment of South Carolina militia promptly took possession, and subsequently during the war Fort Moultrie formed one of the important defenses of Charleston against Federal attacks. Consult: Dawson, *Battles of the United States* (New York, 1858); and McCrady, *History of South Carolina in the Revolution, 1775-80* (New York, 1901).

FORT MYER. A United States military post in Virginia, occupying a reservation of 186 acres, on the west bank of the Potomac River, opposite Washington, D. C., which is the telegraph station. There are post-office and telephone at the post, which was named after Gen. A. J. Myer, the founder of the Signal Service, U. S. A. It has quarters for 33 officers and 300 men, and stables for 450 horses.

FORT NIAGARA. A fort at the mouth of the Niagara River, on the American side. La Salle seems to have built a house here in 1669, and a fortified trading-post, called Fort Conti, ten years later; but both were soon destroyed. In 1686 Denonville built here a fort, which was named in his honor. Soon afterwards this place was besieged by the Senecas. In September, 1688, the fort was destroyed and abandoned; but in 1725-26 Vandreuil built here another fort, called Fort Niagara, which was destined to be more permanent, and which was soon recognized, not only as the most important military station on the Great Lakes, but also as perhaps the greatest trading-post in the country. During the French and Indian War it was the objective point of a futile expedition under Governor Shirley of Massachusetts in 1755, and in July, 1759, after a siege of about

sixteen days, was captured by a British and Indian force under Sir William Johnson. In July, 1764, important treaties were made here by Sir William Johnson with various Indian tribes who had participated in Pontiac's War. During the Revolutionary War the fort was the starting-point of many expeditions sent to ravage the Western frontier, was the headquarters for a time of John Butler and Joseph Brant, and was the place where the Wyoming and Cherry Valley expeditions were organized. Finally, in August, 1796, it was evacuated by the British, in accordance with the Treaty of 1783, and was immediately occupied by an American garrison. It was bombarded from Fort George (q.v.), on October 13-14, 1812; was captured by the British on December 19, 1813; and was again surrendered to the United States on March 27, 1815. In May, 1826, various circumstances having combined to make the fort relatively unimportant from a military point of view, the United States garrison was wholly withdrawn. Consult: Porter, *A Brief History of Old Fort Niagara* (Niagara Falls, 1896); Marshall, *The Niagara Frontier* (Buffalo, 1865); and Severance, *Old Trails on the Niagara Frontier* (Buffalo, 1889).

FORT NINETY-SIX (S. C.). See **NINETY-SIX**.

FORTOUL, fôr'tool', HIPPOLYTE NICHOLAS HONORÉ (1811-56). A French author and statesman, best known for his educational policy under the Second Empire. He was born at Digne, and in 1845 became a professor of literature at Toulouse, and afterwards at Aix. In 1849 he was elected Deputy from the Department of Basses Alpes, and joined the party of Louis Bonaparte. After a few months in the Ministry of Marine, he became, on the coup d'état, Minister of Public Instruction, and did his best to serve the new régime, especially in carrying out the law of 1850, in its narrow opposition to the university. He stopped the courses of Jules Simon at the Sorbonne, and retired Quinet, Mickiewicz, and Michelet from the Collège de France; suppressed the chair of philosophy and replaced it by a chair in logic; and introduced the quasi-elective system of bifurcation, or division of science from letters. This last plan, and the introduction in general of practical features—farming in the primary schools and drawing in the *lycées*, for example—were the only points in which Fortoul showed himself an educator, and not a mere politician.

FORT PAYNE. A city and the county-seat of De Kalb County, Ala., 92 miles northeast of Birmingham; on the Alabama Great Southern Railroad (Map: Alabama, D 1). It has coal and iron mining interests, and among its industrial establishments are iron-works, lumber-mills, fire-clay works, etc. Population, in 1890, 2698; in 1900, 1037.

FORT PICK'ENS. A fort on Santa Rosa Island, Fla., commanding the entrance to Pensacola Harbor, and intended as a defense to the harbor and the United States Navy Yard at Warrington. Early in 1861, at the outbreak of the Civil War, it was under the command of Lieut. Adam J. Slemmer (q.v.), who transferred hither the small garrison of Fort Barancas, directly opposite, and with a force numbering only 81, withstood for some time a siege by a large force of Confederates under Gen. Braxton Bragg

(q.v.). Federal reinforcements, under Col. Harvey Brown, arrived in the middle of April to relieve Slemmer and his garrison, and the fort was held by the Federals throughout the war.

FORT PILLOW. A fort in Tennessee, on the east shore of the Mississippi River, about 40 miles north of Memphis, the scene of the so-called 'Massacre of Fort Pillow' during the Civil War. It was constructed by the Confederates, under the direction of General Pillow, in the spring of 1862; but was abandoned and dismantled by them on May 25th of the same year, and on June 5th was occupied by a small Federal force. Subsequently it was a starting-point for a number of Federal raids, but was regarded as of relatively little strategic importance, and was never strongly garrisoned. On April 12, 1864, it was attacked by a strong Confederate force under Gen. Nathan B. Forrest (q.v.). After offering a stubborn resistance, prolonged even when capture had become inevitable, the garrison was overpowered and almost annihilated. The Confederates were accused of having deliberately massacred the Federals, fully half of whom were negroes, after the latter had surrendered, and color was given to the charge by Forrest's summons to surrender, which closed with the words: "Should my demand be refused, I cannot be responsible for your command." The testimony, moreover, of the survivors almost unanimously confirmed the charge. On the other hand, Forrest and his officers always asserted that the resistance of the garrison was insanely and recklessly prolonged; that the garrison never surrendered; that the Confederates ceased firing as soon as one of their own officers had cut down the United States flag; and that no prisoners, white or colored, were killed or maltreated. The Confederate loss was 20 killed and 60 wounded. Consult: Johnson and Buel (editors), *Battles and Leaders of the Civil War*, vol. iv. (New York, 1887); Nicolay and Hay, *Abraham Lincoln: A History*, vol. vi. (New York, 1890); Wyeth, *Life of General Forrest* (New York, 1899); and Mathes, *General Forrest* (New York, 1902), in the "Great Commanders Series."

FORT PORTER. A United States military post, established in 1867, on a reservation of 28 acres, on the Niagara River, within the limits of the city of Buffalo, which is the post-office and telegraph station. Originally, in 1844, there was a defensive work at Black Rock. The fort has quarters for 15 officers and 225 men.

FORT PREBLE, préb'l. A United States military post, established in 1808, and occupying a reservation of 24 acres at Spring Point, on the east side of Portland Harbor, Maine, two miles from the city of Portland, which is the post-office and telegraph station. Its garrison in 1902 was two companies of coast artillery.

FORT PULASKI. A fort erected on Cockspur Island, Ga., for the defense of the Savannah River. It was occupied by the Confederates at the beginning of the Civil War, and on April 11, 1862, after a virgorous bombardment, was captured by the Federals, its garrison then numbering 350 men, under Col. Charles H. Olmstead.

FORTRESS. See **FORTIFICATION**.

FORTRESS ARTILLERY. See **COAST ARTILLERY**; and **ORDNANCE**.

FORTRESS MONROE. See **FORT MONROE**.

FORT RILEY. A United States military post, established 1852, on a reservation of 19,899 acres, on the Kansas River, $3\frac{1}{2}$ miles from Junction City, Kan., which is the telegraph station, post-office, and station of the Kansas Pacific Railroad at the post. This post was first known as Camp Centre, it being considered the geographical centre of the United States; but subsequently was named after Gen. B. C. Riley, U. S. A. It is the station of the United States Cavalry and Field Artillery School (postgraduate), and has quarters for 50 officers and 1350 men, with stables for 1000 horses.

FORT ROBINSON. A United States military post, on White River, 3 miles from Crawford, Neb. There are post-office and telegraph stations at the post, which has quarters for 520 men, and cavalry stables for 530 horses. It was established in 1874, and occupies a reservation of 20 square miles.

FORT ROYAL. See FORT DE FRANCE.

FORT SAINT PHILIP. See FORT JACKSON.

FORT SAM HOUSTON, hū'ston. A United States military post, established in 1865, as the post of San Antonio, Tex., and occupying a reservation of 469 acres, near the city of San Antonio, which is the telegraph station. There is a post-office at the post. There are quarters for 35 officers and 700 men, and stables for 520 animals.

FORT SCHUYLER, ski'lér. See FORT STANWIX; and Rome, N. Y.

FORT SCHUYLER. A United States military post, which forms one of the defenses to the northern entrance to the harbor of New York. The post was established in 1856, although the fortification was begun in 1833. The reservation comprises 82 acres, on Throgg's Neck, Long Island Sound, $3\frac{1}{2}$ miles from Westchester, which is the post-office and telegraph station. There are quarters for 9 officers and 120 men.

FORT SCOTT. A city and the county-seat of Bourbon County, Kan., 100 miles south of Kansas City; on the Marmaton River, and on the Kansas City, Fort Scott and Memphis, the Missouri, Kansas and Texas, and the Missouri Pacific railroads (Map: Kansas, H 4). It is the seat of the Kansas Normal College, and has a public library, an academy for girls, and Mercy Hospital. The city is in a region of great mineral wealth, deposits of coal, flagstone, cement rocks, clays, mineral paints, zinc, and lead being found. There are foundries and machine-shops, flouring-mills and grain-elevators, cement, pottery, brick, and tile works, etc. Population, in 1890, 11,946; in 1900, 10,322.

FORT SHERIDAN. A United States military post, established in 1887, in the State of Illinois, on Lake Michigan, about 25 miles from Chicago. The reservation comprises 632 acres. There is a post-office and telegraph station at the post, which has quarters for a regiment of infantry and a battalion of field artillery.

FORT SMITH. A city and one of the county-seats of Sebastian County, Ark., at the junction of the Arkansas and Poteau rivers, and on the Saint Louis and San Francisco, the Missouri Pacific, the Kansas City Southern, and other railroads (Map: Arkansas, A 2). It has important wholesale jobbing interests in groceries, meats, dry goods, drugs, furniture, leather goods,

etc.; a large trade in coal, corn, cotton, lumber, live stock, and hides; and extensive manufactures of furniture. There are also sawmills, planing-mills, cottonseed-oil mills, etc. Settled in 1838, Fort Smith was first incorporated in 1842, and was chartered as a city of the first class in 1886. Its government is administered by a mayor, chosen biennially, who nominates the board of health, chief of police, and chief of the fire department, and a city council, elected on a general ticket, which controls the appointments to the other municipal offices, excepting the board of school directors, who are elected by the people. The school district has a large fund, derived from the sale of lands donated by the Government; this, with the revenue accruing from taxation, has enabled the city to build a number of fine public schools, the most notable of which is the high school, costing \$60,000. Population, in 1890, 11,311; in 1900, 11,587.

FORT SNEL'LING. A United States military post in Minnesota, at the junction of the Minnesota and Mississippi rivers, seven miles from Saint Paul and eight miles from Minneapolis. It was established in 1820, and embraces a reservation of 1531 acres. There are a post-office and telegraph station at the post, which was named after Col. Josiah Snelling, U. S. A., its first commander. It has quarters for 37 officers and 520 men.

FORT STANWIX. A fort built in 1758, by Brigadier Stanwix, on the site of the present Rome, N. Y., and near the spot where another fort, soon abandoned, had been built in 1756. From its location on the watershed between Lake Ontario and the Hudson, it commanded the principal line of communication between New York and Upper Canada. Here, in the fall of 1768, a treaty was negotiated by Sir William Johnson with the Six Nations, about 3200 Indians being present. The latter agreed, for the sum of \$10,000 in money and goods, to surrender their title to a vast tract of territory which now constitutes Kentucky, West Virginia, and the western part of Pennsylvania. Soon afterwards the fort was dismantled; but in 1776 it was rebuilt and named Fort Schuyler, in honor of Gen. Philip Schuyler. In the following year Col. Peter Gansevoort, with a garrison of about 750, held it from August 3d to August 22d against Saint Leger, with a force of about 1700 British regulars, Tories, and Indians. The fort was destroyed by flood and fire in 1781, but was subsequently rebuilt again as Fort Stanwix, and here, on October 22, 1784, Oliver Wolcott, Richard Butler, and Arthur Lee, acting on behalf of the Continental Congress, negotiated an important treaty with the Six Nations.

FORT STEPHENSON. See FREMONT, Ohio.

FORT STEVENS. A United States military post, at the mouth of the Columbia River, 110 miles from Portland, Ore. It was established in 1864, and includes a reservation of 1250 acres. There are post-office, telegraph, and railroad stations at the post, which has quarters for six officers and two companies of artillery.

FORT STRONG. A United States military post, on the east end of Long Island, Boston Harbor, Mass. The garrison consists of two companies of coast artillery, and there are connected, as subposts, Forts Andrews and Standish.

FORT SUMTER. A fort on an island at the entrance of Charleston Harbor, about three miles from Charleston, the firing upon which by the Confederates, in April, 1861, precipitated the Civil War. Work was begun on the fortifications about 1830, but was subsequently discontinued, and in 1860 the fort was still in an unfinished condition. For illustration, see Plate of **FORTIFICATIONS**. On November 21st Major Robert Anderson replaced Col. J. L. Gardner as commander of the forts in Charleston Harbor, and, like his predecessor, occupied Fort Moultrie (q.v.). Hostilities with the State forces appearing imminent, however, and Fort Moultrie being almost wholly unprotected against land attacks, he secretly removed his small garrison to Fort Sumter, on the evening of December 26th—six days after South Carolina had passed her ordinance of secession. Anderson and his small garrison applied themselves with energy to the strengthening of the fortifications. After much vacillation on the part of the Administration at Washington, an attempt was made in January, 1861, to relieve the scantily provisioned fort; but the *Star of the West*, a merchant vessel which had been sent for this purpose, and which arrived at the mouth of the harbor early on the 9th, was fired upon by the authorities and forced to put back. After the inauguration of President Lincoln, the policy to be pursued with regard to Fort Sumter was the subject of many Cabinet discussions, and, in large part, of the unofficial negotiations between Seward and the Confederate commissioners in Washington. (See **CONFEDERATE STATES OF AMERICA**.) On April 9th President Lincoln notified Governor Pickens that an attempt would be made to send provisions to the fort, and on the 11th, acting under orders from President Jefferson Davis, General Beauregard, in command of the Confederate forces at Charleston, demanded the evacuation of the fort. Anderson promptly refused to withdraw, though, after a prolonged conference with his officers early on the 12th, he wrote: "I will . . . evacuate Fort Sumter by noon on the 15th instant, and I will not in the meantime open my fires upon your forces, unless compelled to do so by some hostile act against this fort or the flag of my Government. . . . should I not receive prior to that time controlling instructions from my Government or additional supplies." This answer proved unsatisfactory, and the bombardment of the fort began at 4.30 A.M., though Anderson did not return the fire until 7 o'clock. Meanwhile, on the same morning, the relieving fleet sent by President Lincoln arrived at the mouth of the harbor, but was able to accomplish nothing. The artillery duel continued throughout the 12th, and during the morning and part of the afternoon of the 13th, when terms of evacuation were agreed upon between Anderson and Beauregard, the garrison, which consisted of only 128 men, leaving the fort on the following day with the honors of war. There was no one wounded or killed on either side during the bombardment. The contest was of immense importance, since it marked the beginning of the Civil War and put a stop to all peace plans and negotiations.

After taking possession the Confederates greatly strengthened the fort, both for offensive and defensive operations. On April 7, 1863, a Federal fleet of nine ironclads—the *Weehawken*, *Passaic*,

Montauk, *Patapsco*, *New Ironsides*, *Catskill*, *Nantucket*, *Nahant*, and *Keokuk*—under Admiral Dupont, attacked the fort with great energy and gallantry; but after an engagement of about two hours and a half was repulsed, the *Keokuk* sinking on the following day, and several vessels being considerably damaged. General Gillmore, the commander of the land forces engaged against Charleston, established breaching batteries on Morris Island, and after a seven days' bombardment, August 17-23, 1863, virtually reduced the fort to ruins. Thenceforth it was garrisoned only by a small force of infantry, which held it in spite of frequent bombardments, a gallant boat attack made by a force of 400 men under T. H. Stevens, on the night of September 8, 1863, and of a disastrous magazine explosion on December 11, 1863, until February 17, 1865, when it was finally evacuated. During 1863-65 Fort Sumter was commanded successively by Colonel Rhett, Major Stephen Elliott, Capt. J. C. Mitchell, and Capt. T. A. Huguenin. On April 14, 1865, by order of Secretary Stanton, General (formerly Major) Anderson raised over the fort the same flag which he had been forced to lower exactly four years before. Consult: *Official Records*, Johnson and Buel (editors), *Battles and Leaders of the Civil War*, vols. i. and iv. (New York, 1887); Anderson, *Political Conspiracies Preceding the Rebellion*; or, *The True Stories of Sumter and Pickens* (New York, 1882); Crawford, *Genesis of the Civil War: the Story of Sumter, 1860-61* (New York, 1887); Doubleday, *Reminiscences of Forts Sumter and Moultrie in 1860-61* (New York, 1876); and Gillmore, *Report on Engineer and Artillery Operations Against Charleston in 1863* (Washington, 1865).

FORT TERRY. A United States military reservation of 150 acres, on Plum Island, between Long Island Sound and Gardiner's Bay, N. Y. The post-office and telegraph station is New London, Conn. The works are garrisoned by two companies of coast artillery.

FORT THOMAS, tōm'ās. A United States military post, established in 1887, consisting of a reservation of 280 acres (including a rifle range of 169 acres). It is situated in Kentucky, on a bluff overlooking the Ohio River, 3 miles from Newport, Ky., and 4 miles from Cincinnati. There are post-office and telegraph station at the post. Quarters are provided for 31 officers and 9 companies of infantry.

FORT TOT'TEN. This post, for many years the headquarters of the United States Battalion of Engineers, was established in 1862, and was originally called Willets Point. The reservation comprises 136 acres on the East River at the western end of Long Island Sound, two and one-half miles from Whitestone. The post-office and telegraph station is Willets Point, N. Y. It is one of the defenses of the northern entrance to New York Harbor. There are quarters for five companies of artillery.

FORT TRUMBULL. A United States military post, established in 1839, and occupying a reservation of 13 acres on the south side of New London Harbor, Conn. In 1777 a small redoubt by this name, and another in 1812, occupied this site. The post-office and telegraph station is New London, Conn. The garrison in 1902 consisted of two companies of artillery.

FORTUNA (Lat., from *fors*, chance, probably connected with *ferre*, to carry). In classical mythology, the goddess of chance, called by the Greeks Tyche. According to Hesiod, she was a daughter of Oceanus; according to Pindar, a sister of the Parce. She differed from Destiny or Fate, in so far that she worked without law, giving or taking away at her own good pleasure, and dispensing joy or sorrow indifferently. She had temples at Sicyrna, Corinth, and Elis. In Italy she was extensively worshiped from a very early period and had many names such as *Patricia*, *Plebeia*, *Equestris*, *Virilis*, *Primigenia*, *Publica*, *Privata*, *Mulieris*, *Virginensis*, etc., indicating the extent and also the minuteness of her superintendence. Particular honors were paid to her at Antium and Praeneste; in the temple of the former city two statues of her were even consulted as oracles. Greek poets and sculptors generally represented her with a rudder, as a symbol of her guiding power, and a cornucopia; or with a ball, or wheel, or wings, as a symbol of her mutability.

FORTUNATÆ INSULÆ. See CANARY ISLANDS.

FORTUNATUS. The chief figure of a popular tale, or rather collection of tales, centring about the fortunes and misadventures of Fortunatus and his sons with a wishing cap and an inexhaustible purse, which prove their possessor's ruin. Many of the materials are ancient, but the composition is German of about 1450. *Fortunatus* was first printed at Frankfurt in 1509 (reprinted in Simrock's *Deutsche Volksbücher*, 1846), and often afterwards in German, French, Italian, Dutch, English, Danish, Swedish, Icelandic. It was dramatized by Hans Sachs (1553), and in English by Thomas Dekker (1600), whose *Old Fortunatus* was turned back into German in 1620. The best modernization of the story is by Tieck in *Phantasiën* (1816). Uhland left an unfinished narrative poem on Fortunatus and the idea was used by Chamisso in his *Peter Schlemihl*.

FORTUNATUS, VENANTIUS HONORIUS CLEMENTIANUS (c.530-c.600). Bishop of Poitiers, and chief Latin poet of his time. He was born at Ceneda, near Treviso, and studied at Ravenna. After traveling through Germany and France he took up his residence at the Court of Sigbert, King of Austrasia, where he wrote an epithalamium to celebrate the King's marriage with Brunhilda. He again took up the wandering life, but finally settled at Poitiers, where he was brought into association with Radegunda, wife of Clotaire II., who was living there in retirement in a convent which she had founded, and also met Gregory of Tours and other eminent ecclesiastics. He became a priest, and in 599 was chosen Bishop of Poitiers. Fortunatus wrote hymns, epitaphs, poetical epistles, verses in honor of his patrons, and descriptions of events in his life. He also wrote a life of Saint Martin of Tours and several other lives of saints. His hymn, *Vexilla regis prodeunt* ('The royal banners forward go'), is well known in the English translation by J. M. Neale. His works are in Migne, *Patrol. Lat.*, lxxxviii.; the best edition is by Leo and Krusch (Berlin, 1881-85). For his life consult: Leroux (Paris, 1885) and Nisard (Paris, 1880).

FORTUNE. A poem attributed by John Shirley to Chaucer. It first appeared in a set of poems brought together by the latter, the manuscripts of which are now in the Harleian Collection in the British Museum. The sources of the poem were partly Boëthius and partly the *Roman de la Rose*. It is described in the subtitle as "The Face of the World as it really is, not painted."

FORTUNE. A painting by Guido Reni, representing the Goddess of Fortune undraped, moving over a globe, and scattering money from a purse, while a cupid clings to her flowing hair and scarf. The painting is in the Accademia di San Luca, Rome.

FORTUNE, THE. A play-house which once stood near Blackfriars Bridge, London, close upon the site of the ancient Monastery of the Black Friars. It was first erected in 1599 by Philip Henslowe and Edward Alleyne, and occupied by the Lord Admiral's Company. It was originally of wood, was burned down in 1621, was rebuilt in brick, and was torn down by the Puritans in 1649.

FORTUNE, TEMPLE OF. One of the most ancient extant temples of Rome, and one of the best preserved, in the Forum Boarium, near the Æmilian Bridge. It was erected by Servius Tullius, and was rebuilt in the third century B.C. In the ninth century A.D. the spaces between the columns were walled up and the edifice became the Church of Santa Maria Epiziaca. The temple is remarkable for its pure Ionic architecture, and for the absence of marble in its construction. The exterior was covered with painted stucco. It contained a wooden statue, draped in a toga, which Pliny says lasted until the time of Tiberius. The popular name of the temple, *Fortuna Virilis*, is probably due to a mistranslation of its original title, *Templum Fortis Fortunæ*, in which Fortis was the genitive of *fors*, not of the adjective *fortis*.

FORTUNE, ROBERT (1813-80). An English botanist and traveler. After receiving a common school education he was employed in the Edinburgh Botanical Gardens, and at the conclusion of the Chinese War in 1842 he was sent to collect plants in northern China by the Royal Horticultural Society. His second journey to China in 1848, in the interests of the East India Company, like the first, gave to Europe many of the beautiful flowers of the Far East, and also resulted in the introduction of the tea shrub into India, where formidable competition with China in the production of tea immediately began. A third expedition included Formosa and Japan; and in 1857 Fortune again visited China to collect seeds of the tea shrub for the United States Patent Office. His published works include: *Three Years' Wanderings in the Northern Provinces of China* (1847); *Report upon the Tea Plantations in the Northwest Provinces* (1851); *A Journey to the Tea Countries of China* (1852); *Two Visits to the Tea Countries of China* (1853); *A Residence Among the Chinese* (1857); *Yeddo and Peking: A Narrative of a Journey to the Capitals of Japan and China* (1863).

FORTUNES OF MOLL FLANDERS, THE. A novel by Defoe (1722), the story of a harlot, thief, and convict, who finally reforms.

FORTUNES OF NIGEL, THE. An historical novel by Walter Scott (1822). The scene is laid in London, and gives a vivid sketch of life in that city in the early years of the seventeenth century.

FORTUNE-TELLING. The telling of fortunes, whether by the arts of astrology, palmistry, or other forms of divination, was not an offense at the common law. But by the English Vagrancy Act of 1824 (5 George IV., c. 83) any person who pretends to tell fortunes or practice palmistry is liable to summary punishment by imprisonment as a rogue and a vagabond. Modern statutes in this country generally class those 'pretending to tell fortunes' as disorderly persons, and provide for their arrest and summary examination.

FORTUNIO. The daughter of an octogenarian lord, who in disguise goes as her father's substitute when he is summoned for military service. With the aid of resources granted her by a fairy, she accomplishes many wonderful feats. The character appears in many fairy tales, ancient and modern.

FORTUNY Y CARBO, för-tōō'nē ē kär'bō, (1839-74). A Spanish painter and etcher. He was born at Réus, in Catalonia, June 11, 1839. He studied at the academy at Barcelona, under Claudio Lorenzalez, and received inspiration from lithographs of Gavarni. Afterwards he turned for his motives directly to nature. In 1856 he won a school prize, which enabled him to study at Rome. During the Spanish war against Morocco (1859-60), he was on the staff of General Prim, and was completely absorbed in sketching those Oriental scenes which appealed most strongly to his nature. With a view of copying the Spanish masters he went, in 1865, to Madrid, where he fell somewhat under the influence of Goya. There he made the acquaintance of Madrazo, whose daughter he married. In 1866 he visited Paris and received from the art dealer Goupil commissions which placed him above want, and soon after he settled in Rome. Henceforth he devoted himself to kaleidoscopic pictures of the Rococo period, which became his special province. His studio in Rome was a salon in which men of letters, artists, and many brilliant members of the social world were wont to congregate. He was forced by ill health to leave Rome for a while, but in 1874 returned to that city, suffered a relapse, and died October 21st of that year. His canvases were usually small in dimensions, but filled with multitudinous details painted with great freedom, skill, and vivacity of colors. He was very successful in dazzling sunlight effects. The city hall of Barcelona contains several of his paintings, notably the "Battle of Tetuan," considered one of his finest works, although unfortunately not finished. The sketch for this is in the Museo de Arte Moderno at Madrid, which also contains "Queen-Regent Maria Christina and Her Daughter Inspiring the Government Troops."

His work is to-day the dominating influence in Spanish art, in so far as it is individual, and has influenced the French school as well. Of his Oriental subjects, the best-known are the "Praying Arab," "Fantasy of Morocco" (1866), "Tribunal of a Cadi," and, especially, the "Snake Charmers," which he duplicated. His most cele-

brated Rococo picture is the "Spanish Marriage" ("La Vicaria," 1869), containing portraits of the painter Regnault (q.v.), Madame Fortuny, and other friends. Others are the "Trial of the Model," the "Poet," the "Rehearsal," the "China Vase." There is a large number of his works in America, both in public and private possession. Among these are three good examples: "An Ecclesiastic," "Don Quixote," and the "Mendicant," in the Waters Collection, Baltimore, and a portrait of a "Lady in Black," in the Metropolitan Museum, New York. Others of his most widely admired creations are "Hindoo Snake-Charmers," in the Walters Collection, Baltimore; "Wedding in the Vicaria at Madrid," "The Butterfly," and "Academicians Choosing a Model." One of his Oriental subjects, "Camels at Rest," is in the Metropolitan Museum, New York.

Fortuny was also an aquarellist of note, and a brilliant etcher, his works resembling those of Goya. Like him, he uses as a background the aquatint, and the outlines of his figures are drawn with light and spirited strokes. Some of his chief etchings are the "Dead Arab," the "Shepherd," the "Reader," the "Pensioner," the "Anchorite," the "Arab Mourning." Consult the biographies of Fortuny by Davillier (Paris, 1875) and Yriarte, in *Les artistes célèbres* (ib., 1885). See also the *Fortuny Album*, published by Goupil (ib., 1889); Bell, *Representative Painters of the Nineteenth Century* (New York, 1899); Muther, *History of Modern Painting*, vol. iii. (London, 1896).

FORT WADSWORTH. A United States military post, established in 1827, and occupying a reservation of 221 acres on Staten Island, N. Y., commanding 'the Narrows.' The post-office is Rosebank, N. Y., while the telegraph station is Quarantine, Clifton, S. I. It was named for Gen. J. S. Wadsworth, who was killed in the battle of the Wilderness (1864).

FORT WALLA WALLA, wōl'la wōl'la. A United States military post, established in 1857, and occupying a reservation of 612 acres, one mile from Walla Walla, Wash., which is the post-office, telegraph, and railroad station. Its garrison consists of two companies of field artillery.

FORT WARREN. A United States military post, established in 1837, and occupying a reservation 28 acres in extent on Georges Island, 7¼ miles southeast of Boston, Mass. The post was first occupied in 1861, and during the Civil War was used as a military prison. The post-office and telegraph station is Boston, Mass. The garrison comprises two companies of artillery.

FORT WASHINGTON, An important military post during the American Revolution, occupying the highest part of Manhattan Island, and covering the ground overlooking the Hudson between the present 181st and 182d Streets, New York. It was surrendered to the English under Sir William Howe on November 16, 1776. After the battle of White Plains (q.v.), Washington crossed over to New Jersey, but against his better judgment, left a considerable force under Colonel Magaw in Fort Washington. Howe invested the fort on November 15th, and commanded the garrison to surrender on pain of being put to the sword. Magaw replied that he would defend the place to the last

extremity. The next day the British attacked in four divisions, led respectively by General Knyphausen and General Matthews (supported by Lord Cornwallis), Lieutenant-Colonel Sterling and Lord Percy. Soon after daybreak the cannonading began, and it continued with great fury on each side until noon. Knyphausen's Hessians then advanced in two columns, one of which, under General Rahl, ascending circuitously to the summit of the hill, penetrated Magaw's advanced works, while the other ascended the hill in a direct line, suffering much on the way from the well-directed fire of Colonel Rawling's riflemen. The second division made good their landing, forced the opposing Americans from their sheltering rocks and trees up a steep and rugged hill; while the third, landing under a heavy fire, succeeded, after a stubborn fight, in carrying an advanced redoubt. Percy's division, with conspicuous gallantry, carried other advanced works. On a second summons from Howe, Magaw, seeing the uselessness of further resistance, surrendered the fort, his troops (2600 in number) becoming prisoners of war. The American loss in killed and wounded was 130; the British, 454. The English had been materially assisted by the treason of one of Magaw's officers, William Demont, who, on November 2d, had deserted, and furnished Howe with detailed plans of the American works. The loss of the fort caused great consternation throughout the United States, and has been regarded as, in some respects, one of the greatest military misfortunes of the Americans during the war, the garrison representing the flower of Washington's army. Consult: De Lancey, *The Capture of Fort Washington, the Result of Treason* (New York, 1877); Dawson, *Battles of the United States* (New York, 1858); and Carrington, *Battles of the American Revolution* (New York, 1876).

FORT WASHINGTON. A United States military post, established in 1815, and comprising a reservation of 334 acres on the left bank of the Potomac River, $1\frac{1}{2}$ miles below Washington, D. C. The garrison consists of three companies of coast artillery.

FORT WAYNE. A United States military post, established in 1842, and containing a reservation of 63 acres on the Detroit River, near the city of Detroit, which is the post-office and telegraph station. There are quarters for a battalion of infantry.

FORT WAYNE. A city and railroad centre, the county-seat of Allen County, Ind., 150 miles east by south of Chicago, Ill., at the junction of the Saint Joseph's and Saint Mary's rivers, which here unite in the Maumee, and on the Pittsburg, Fort Wayne and Chicago, the Lake Shore and Michigan Southern, the Grand Rapids and Indiana, the New York, Chicago and Saint Louis, the Wabash, the Lake Erie and Western, and the Cincinnati, Hamilton and Dayton railroads (Map: Indiana, D 1). It occupies an area of nearly 10 square miles on a plateau at an elevation of 775 feet, and has a United States Government building, a court-house that cost over \$1,000,000. Saint Joseph's and Hope hospitals, Indiana School for Feeble-Minded Youth, orphan asylums, a public-library building, for the erection of which Andrew Carnegie gave \$75,000, three public parks, and monuments to Anthony Wayne and Henry W. Lawton. It is also the seat of Concordia Col-

lege (Lutheran), opened in 1839. The city is in an agricultural district and has important manufacturing interests. The industrial plants include shops of the Pennsylvania and the Wabash railroads, foundries and machine-shops, wheel-works, flouring-mills, electric-light works, knitting-mills, oil-tank works, packing houses, shirt and waist factories, etc.

Fort Wayne is governed by a mayor, who holds office for four years, and a unicameral council. Of the municipal officials, the boards of health, public works, and public safety are appointed by the mayor and confirmed by the council. The annual income of the city, including revenues of water-works, amounts to about \$650,000, expenditures to \$475,000, the principal items of expense being \$30,000 for the police department (including amounts for police courts, jails, etc.), \$50,000 for the fire department, and \$100,000 for schools. The water-works, which are owned by the city, are operated at a yearly cost of about \$40,000. Fort Wayne is built on the site of the principal village of the Miami Indians and near the site of the old French Fort Miami. In October, 1790, General Harmar burned the village. In 1794 Gen. Anthony Wayne built a fort here which, in September of 1812, was closely besieged by the Indians. A village gradually grew up and was chartered as a city in 1839, though growth of the place was very slow until after the completion of the Wabash and Erie Canal in 1840, and of several railroads between 1850 and 1860. Population, in 1850, 4282; in 1870, 17,718; in 1890, 35,393; in 1900, 45,115.

FORT WILLIAM. A town in Algoma District, Ontario, Canada, on the Kaministiquia River, near Lake Superior (Map: Ontario, L 8). It is an important landing-place for lake steamboats and the terminal station of the east division of the Canadian Pacific Railroad. It has grain-elevators in connection with an important shipping trade, and is a favorite summer resort for boating, fishing, and shooting. It is picturesquely situated at the foot of McKay Mountain, and was founded by the Hudson Bay Company in 1801; their old fort is now a powerhouse. The United States is represented by a consular agent. Population, in 1891, 3000; in 1901, 3633.

FORT WILLIAM. See CALCUTTA.

FORT WILLIAM HENRY. A fort erected in 1755 by Sir William Johnson (q.v.) on the site of the present Caldwell, N. Y., at the head of Lake George. During the early part of the French and Indian War it was an important strategic position, and was the starting-point for many minor expeditions against the French and Indians. Rigaud, at the head of a considerable French force, made a half-hearted and unsuccessful attack upon it in the spring of 1757 (March 18-23), and later in the year Montcalm marched against it at the head of a force of about 8000, including 2000 Indians. On August 2d he demanded the surrender of the fort, then garrisoned by about 2200 men, and on the refusal of Colonel Munro, the commanding officer, began a vigorous attack. Although Colonel Webb was stationed at Fort Edward, only fifteen miles away, with an English and colonial force of 1600, Colonel Munro was not reinforced, and on the 9th was compelled to surrender. Montcalm agreeing that the garrison should march out with the honors

of war, and should be escorted to Fort Edward by a detachment of French regulars. Early on the 10th the survivors began their march, but were soon set upon by the Indians, and a general massacre ensued, an unknown number of the troops being killed outright, and many more being carried into captivity. Though this attack was not instigated by the French, contemporary evidence seems to show that no earnest effort was made by them to force the Indians to observe the treaty stipulations. Cooper used this incident in his *Last of the Mohicans*. Consult Parkman, *Montcalm and Wolfe* (Boston, 1884).

FORT WORTH. A city and the county-seat of Tarrant County, Texas, 30 miles west of Dallas; on Trinity River, and on the Gulf, Colorado and Santa Fé, the Texas and Pacific, the Chicago, Rock Island and Pacific, the Fort Worth and Denver, the Fort Worth and Rio Grande, and other railroads (Map: Texas, F 3). It is the seat of Fort Worth University (Methodist Episcopal) founded in 1881, Polytechnic College (Methodist Episcopal, South) opened in 1891, and the Fort Worth Medical College. Among the finest structures in the city are the Carnegie Public Library, railroad depots, post-office, city hall, and county court-house. Fort Worth has an annual trade valued at \$30,000,000; it is the centre of a vast stock-raising country, and is an important cotton market. The industrial establishments include stock-yards, packing houses, grain-elevators, flour-mills, tanneries, breweries, railroad repair-shops, foundries and machine-shops, cotton and oil mills, etc. Settled in 1849, Fort Worth was incorporated in 1872. The government is administered under a charter of 1900, by a mayor elected biennially, and a council which controls the appointments to most of the subordinate municipal offices. The city owns and operates its water-works and electric-light plant. Population, in 1880, 6663; in 1890, 23,076; in 1900, 26,688.

FORT YELLOWSTONE. A United States military post, established in 1886, and formerly Camp Sheridan (1874). The reservation comprises 28 acres on Beaver Creek, and is eight miles from Cinnabar on the Northern Pacific Railroad, within the limits of Yellowstone National Park. The post-office and telegraph station (June to October) is Mammoth Hot Springs, near the post; and telegraph station (October to May) Cinnabar, Mont. The garrison is one company of cavalry, and has charge of the Yellowstone National Park.

FORTY-NINERS. A name popularly applied to the throng of fortune-seekers who emigrated to California in the years immediately following the discovery of gold there in 1848, especially to those who went during the period of greatest excitement in 1849. They were also called 'Argonauts.' They came, some by land and some by sea, from all parts of the world, and had among them representatives of almost every nationality, of every color, and of every social stratum. Those who came by sea embarked, for the most part, from ports in the Eastern States, some making the long and dangerous voyage around Cape Horn, and others proceeding to Chagres, and thence across the Isthmus to Panama, where they again embarked on any vessel obtainable. The chief carriers were the three side-wheelers, the *California*, the *Oregon*, and the *Panama*,

of the Pacific Mail Steamship Company, which frequently transported more than three or four times the number of passengers for which they were designed. Besides these, nondescript vessels, of every size and kind, were commissioned for the service, and were likewise greatly overcrowded, while many reckless adventurers, unable to force their way aboard, left for their destination in clumsy Indian dug-outs. Much as passengers by the sea suffered, however, overland travelers suffered even more. The majority of these gathered from May to June of each year at Independence or Saint Joseph, Mo., at that time on the frontiers of civilization, and then proceeded to Sacramento in long caravans, continually harassed on the way by the Indians, and forced to suffer terribly from starvation, exposure, and fatigue. The first emigrant train reached Sacramento in August, 1849, and others followed in quick succession. By the end of 1849 it is estimated that 42,000 emigrants had arrived by land, and 30,000 by sea. Consult: Bancroft, *History of the Pacific States*, vol. xviii. (San Francisco, 1888), and ib., *California Inter-Pocula* (San Francisco, 1888); Bayard Taylor, *El Dorado* (New York, 1862); Stillman, *Seeking the Golden Fleece* (San Francisco, 1877); and Bret Harte, *Tales of the Argonauts* (Boston, 1875).

FORTY THIEVES, THE. A band of robbers, in the tale of "Ali Baba," in the ordinary translations of the *Thousand and One Nights*, although not found in the best Arabic manuscripts. They dwelt in a cave in the forest, the door of which opened only in response to the words 'Open, sesame.'

FORUM (Lat., market-place; connected with *foris*, door). The term applied by the Romans to the large open space in the central part of any city, which was the common resort of the people for business and pleasure. It was the political centre, where the magistrates and people met, and where elections were held; here were the administrative and civic buildings or inclosures, such as the *comitium*, with its tribunals and rostra for the large assembly; the *curia* or senate-house, temples, treasuries, and basilicas, or law courts. At each end of the road or roads crossing the fora were often archways, or *Jani*, used as resorts for merchants and scribes. The other buildings bounded the forum on different sides, and between them were shops or *tabernæ* belonging to the different trades.

HISTORIC EVOLUTION. In the early days of the Royal and Republican ages, there appears to have been but a single forum in each city, serving not only for political, legal, and mercantile purposes, but also for the popular games and amusements—the theatrical shows, wild-beast contests, gladiatorial fights, and races. The old Roman Forum and all those modeled upon it, like that of Sinuessa, were of this type. The next stage was the distinction into two fora, one devoted to law, administration, and politics, and the other to the sale of commodities. This was due, perhaps, to the influence of Greece, where there were often two agoras of this description—as at Athens. The Greek agoras were microcosms of the city, filled with tents, shops, and benches, surrounded by special buildings, and with bazaars in the connecting streets; here laborers were hired, slaves bought, and all business transacted. Until a few decades ago the plan and buildings of

THE ROMAN FORUM
SHOWING THE COLUMNS OF THE TEMPLE OF SATURN (RIGHT), THE ARCH OF SEPTIMIUS SEVERUS, THE CHURCH OF SS. MARTINA E LUCA, AND THE COLUMNS OF THE TEMPLE OF VESPASIAN

such Greek squares were hardly known at all, except for Pausanias's description of those at Athens, Megalopolis, Corinth, Messene, Elatea, Sparta, and Elis; but a number have recently been excavated or investigated with great success, not only in Greece, but in Asia Minor, especially at Priene, Miletus, Side, Termessus, Aphrodisias, Antiphellus, Pessinus, and Cnidus. It is not possible to compare closely these Greek agoras with the Roman fora. The differences are due, not merely to the very different schemes of administration, but to the great importance given to law by the Romans, which finally made of the basilicas the great factor in the administrative fora.

THE DIFFERENT FORA. The third stage, however, in the differentiation of the fora, had been reached before the basilicas (q.v.) had attained this importance; it was through the establishment of a separate forum for the sale of each important commodity. There were one or more cattle or meat markets (*forum boarium*, *forum saurium*, *forum pecuarium*), for horned cattle, pigs, and sheep; a fish-market (*forum piscarium*); a wine-market (*forum vinarium*); a vegetable-market (*forum olitorium*); a grain-market (*forum pistorium*). Less space was required for the trades, such as goldsmiths, saddlers, glaziers, money-changers, dry-goods merchants, blacksmiths, tinmiths, etc., and they occupied shops around these separate squares, or on streets leading from them. There were evidently sometimes covered markets, such as cloth-markets, like that of Pompeii. The city theatre often adjoined the forum, as at Ostia and Timgad; so did the circus and amphitheatre in many cases. The temples of the forum often served more than a religious purpose: in Rome the Temple of Concord served for meetings of the Senate, and that of Saturn was at one time the State Treasury, and even the public archives until the erection of the Tabularium (q.v.). In many Imperial Roman cities there was a *Capitolium* in connection with the forum, a triple temple in imitation of the Temple of Jupiter (Juno and Minerva), as at Susestula. Of the fora outside of Italy, those of the cities of North Africa are the most interesting and direct imitations, and their ruins are numerous and untouched. The most important is at Thamugadi (Timgad), like so many other African cities, a military colony. It had its two triumphal arches at each end of its main road, its temples, curia, scholæ of the corporations, tribunal and rostra, basilica and colonnades inclosing the square.

The fora at Pompeii are also well preserved. They were: The *forum triangulare* to the south, with the Doric Greek temple, a colonnade on two sides, and an Ionic portico at the entrance; the principal forum, about 450 feet from north to south, with the Temple of Jupiter, flanked by a memorial arch on each side, formerly the main entrance, on the north, with the three *curiæ* or tribunals, occupying the south end, with the Basilica and the Temple of Apollo on the west, and the *macellum* or market, the 'Senaculum,' the Temple of the Genius of Augustus, and the Scholæ or corporation building on the east side, and near by the building of the Eumachia, or cloth-market.

The open spaces in all the fora were so filled with honorary statues even as early as the Republican period, as well as with altars, arches,

wells, memorial columns, etc., that it was necessary at times in the Roman forum to order a wholesale removal of them. The fora of Rome were naturally in a class by themselves, although in the fourth century A.D. those of the new Imperial capital, Constantinople, were made almost to rival them in number and wealth of artistic decoration by the Emperors from Constantine to Honorius.

THE FORUM ROMANUM. The original Roman Forum (*Forum Romanum Magnum*) occupied the lowlands between the Palatine, Capitoline, and Quirinal hills, and served as political and commercial common ground for the separate tribes inhabiting these different hills, as well as those on the Caelian and Esquiline, before the closer union under the Tarquins when Rome became one city. Then the Forum took a more regular and monumental shape, and was underdrained and surrounded by shops. The temples of Saturn (B.C. 497), of the Dioscuri (B.C. 484), and of Concord (B.C. 367) added substantially to its beauty, but it was not until quite late (B.C. 184) that the first court-house, the Basilica Porcia, was built, to be followed by the Fulvia (Æmilia), Sempronia, and Opimia, giving to the Forum the characteristic colonnaded effect that was imitated in other cities. This crowding of the open space with buildings and honorary monuments, and the increasing importance of the political aspect of the Forum (being the place of meeting of people and Senate), as well as its legal aspect, led to the relegation to a separate market of the malodorous fish-mongers' stalls (*forum piscatorium*), and this example was followed for the other venders, as explained above. Even this failed to give sufficient room for the rapidly expanding political-judicial life of the city, and in B.C. 54 a new era was commenced by the construction of the Æmilian basilica, in pursuance of a scheme carried forward by Julius Cæsar, who began the addition of the special fora.

IMPERIAL FORA. The Forum Julium was followed by Augustus with his Forum Augustum or Forum Martis, by Vespasian with his Forum Pacis, by Domitian and Nerva with the Forum Transitorium, and finally by Trajan with his magnificent Forum Traiani, the most superb architectural group in Rome—all communicating with the Forum Romanum in a continuous line to the north and east of it. Of these, the Julian Forum was in the form of a sacred inclosure, around a temple of Venus Genetrix, Cæsar's patroness; the Augustan, dedicated to Mars, was an inclosure ending in the Temple of Mars Ultor, flanked by two triumphal arches, and intended to be an heroum, filled with a gallery of statues of great Romans who had extended the boundaries of Roman power; the Forum of Nerva was dedicated to Minerva, and besides her temple contained the main thoroughfare of this part of the city, which gave it the name Transitorium. Finally, the Forum of Trajan had its own special basilica (*Basilica Ulpia*), like the great Forum: it was entered through a colossal triumphal arch leading to the open square of the forum surrounded by a double colonnade, with the Emperor's equestrian statue in the centre, and flanked by a large hemicycle on each side. Then came the Basilica Ulpia, also with two end hemicycles, and a double two-storied colonnade, the double Library with the Memorial Column in the intermediate area, and, finally, the Temple of

Trajan, erected by Hadrian. The importance of this forum was increased by the fact that it took the place of the hill connecting the Capitoline and Quirinal, and so for the first time established an adequate connection between the two sections of the city on either side of the Capitoline Hill. As for the Roman Forum itself, its decoration was continued to the latest days of the Empire, many honorary statues being set up and buildings repaired during the fourth century. Its appearance at that time was about as follows: Backing against the Capitol were the temples of Concord, of Vespasian, and the Dii Consentes, while the Temple of Saturn occupied the space between the ascent to the Capitol and the Vicus Jugarius, where the Arch of Tiberius also stood, across the forum facing the Arch of Septimius Severus, with the Rostra between them. Beyond the Arch of Severus were the political buildings, the Curia or Senate-house, and its annexes, on the Comitium, the other buildings on the north side being the Temple of Janus and the Basilica Æmilia. On the opposite (south) side was the great Basilica Julia, occupying the space between the Vicus Jugarius and the Vicus Tusculus, and the Temple of Castor (Dioscuri)—one of the most exquisite works of Roman architecture. The centre of the open space is here occupied by the Temple of Julius, flanked by a triumphal arch of Augustus. Continuing eastward we reach the primitive religious centre of this region, the Regia and the Shrine of Vesta with its atrium opposite, which are the Temple of Antoninus and Faustina and the Templum Urbis. Here anciently stood the Arch of the Fabii, originally the entrance to the Via Sacra.

LATER HISTORY. The topography and monuments of the Forum appear to have suffered but slight damage from the barbarian invasions of the fifth century, and it was not until the ninth century that its ruin was noticeable, accompanied by a rise in its level. It was the fire of 1084, when Guiscard captured the city, which gave the old buildings their death blow, and buried them partly out of sight, the more conspicuous being occupied as feudal fortresses, and the level spaces turned into gardens. The Renaissance combined, with its antiquarian curiosity, a destructive vandalism which was more fatal to the Forum and the monuments surrounding it than any previous disasters, especially under Paul III. (1534-49). The area became waste land, in which stood a few melancholy columns. It was called the Campo Vaccino. The destruction stopped only at the beginning of the nineteenth century under Pius VII. and his antiquarian Fea, and excavations have been carried on almost continuously ever since then. It is to be regretted that they have not been conducted in an absolutely scientific manner until those of recent years under Boni (whose admirable methods deserve high praise), and resulted until then in the destruction of many landmarks. Much remains to be done, especially in the region of the Basilica Æmilia and in the lower strata of the Republican and Royal periods.

BIBLIOGRAPHY. The scientific works of Jordan, *Topographie der Stadt Rom im Alterthum* (Berlin, 1871); Richter, *Topographie der Stadt Rom* (Munich, 1901); and Gilbert, *Geschichte und Topographie der Stadt Rom* (Leipzig, 1883-85), may be supplemented by Middleton, *The Remains of Ancient Rome* (London, 1892);

Nichols, *The Roman Forum* (London, 1877), and the various publications of Lanciani and Hülsen, especially Lanciani, *Ruins and Excavations of Ancient Rome* (Boston, 1897), as well as the recent handy guide of Marucchi, *Le Forum Romain* (Rome, 1901 et seq.). Hülsen has published a restoration of the Forum (in *Das Forum Romanum*, Rome, 1892), and with Kiepert a plan in *Formæ Urbis Romæ Antiquæ* (Berlin, 1896), while Lanciani, *Forma Urbis Romæ* (Milan, 1901), gives the ancient plan on a larger scale and by different methods. The inscriptions of the Forum are given in the *Corpus Inscriptionum Latinarum*, vol. vi. (Berlin, 1893); the best photographs are by Anderson and Alinari. An early detailed restoration, Canina, *Gli edifizii di Roma Antica* (Rome, 1848-56), is spectacular but unreliable; Dutert, *Le Forum Romain* (Paris, 1876), is far preferable. The official report of Boni is to be found in *Notizie degli scavi* (Rome, 1899 et seq.).

FORUM. In law, a court, or a place of jurisdiction. It is used by Blackstone in the first sense, when he speaks of leaving a person to his "common remedy in *foro contentiosis*"—in a court of litigation, that is in an ordinary court of justice. Judges sometimes refer to a domestic court as *forum domesticum*. The term is used in a similar sense when an advocate is described as eminent or successful in the forum. It is more frequently employed in the second sense, as a place of jurisdiction. It bears this signification in Kent's commentaries. "In respect to remedies," writes the Chancellor, "there are properly speaking three places of jurisdiction: (1) The place of domicile of the defendant, commonly called the *forum domicilii*; (2) the place where the thing in controversy is situate, commonly called the *forum rei sitæ*; (3) the place where the contract is made, or the act done, commonly called the *forum rei gestæ* or the *forum contractus*." When it is said that a question is to be determined by the *lex fori*, it is meant that the decision is to be in accordance with the law of the jurisdiction within which the action is brought. (See **CONFLICT OF LAWS**.) The employment of the term in these and similar significations is due to the fact that Roman courts of justice were held in or near the Forum. Consult Forsyth, *Hortensius the Advocate*, ch. iii. (Jersey City, 1881).

FORUM APPII. A town on the famous Appian Way (q.v.); the modern Foro Appio, 43 Roman miles from Rome. Here a canal began which ran southward parallel with the Appian Way to within a short distance of Terracina. Horace (*Satires* i., 2 sqq.) has an amusing description of the place as "abounding in boatmen and wretched inns." Here travelers might, if they preferred, change from the road to the canal-boat. This was Horace's choice, much to his discomfort. At this place, Paul, on his journey to Rome, being met by brethren of the Roman Church, 'thanked God and took courage' (Acts xxviii. 15).

FORUM BOA'RIMUM. The ancient cattle-market of Rome, situated between the Velabrum and the Tiber; on its side stands the elegant circular Temple of Hercules (?), popularly called the Temple of Vesta.

FORUM JULIUM, or FORUM OF CÆSAR. The first of the five Imperial fora at Rome. It

was built by Cæsar from the spoils of the Gallic war, on ground to the northeast of the Forum Romanum, for which \$4,000,000 was paid. It was surrounded by arcades and contained the magnificent temple of Venus Genetrix. Nothing now remains of its buildings but some half-buried arches.

FORUM OF AUGUSTUS. See AUGUSTUS, FORUM OF.

FORUM OF NERVA. See NERVA, FORUM OF.

FORUM OF TRAJAN. See TRAJAN, FORUM OF.

FORUM OL'ITO'R'IUM (Lat., vegetable market). The vegetable market of Rome, adjoining the Forum Boarium. The space contained several temples, of which some remains are preserved.

FORUM PA'CIS (Lat., Forum of Peace), or **FORUM OF VESPA'SIAN.** The third of the Imperial fora at Rome, built to inclose Vespasian's Temple of Peace, called by Pliny one of the three most magnificent buildings in Rome. In it were dedicated the spoils taken from Jerusalem. There are no remains of the temple. This forum was separated from the Forum of Augustus by a wide street leading from the Subura to the Forum Romanum. This strip later became the Forum Transitorium of Nerva.

FORUM ROMA'NUM. See FORUM.

FORUM TRAN'SITO'R'IUM. See NERVA, FORUM OF.

FORWARD, WALTER (1786-1852). An American lawyer and Cabinet officer, born in Hartford County, Conn. In 1803 he removed to Pittsburg, Pa., where for some time he was an editor of the Democratic newspaper, the *Tree of Liberty*. He then studied law, was admitted to the bar in 1806, and for some time combined both law and journalism. In 1822 he was elected to Congress as a Democrat, to fill a vacancy, and in 1823 took his seat for a full term, to serve until 1825. During this time he became associated with the followers of John Quincy Adams, whom he supported for the Presidency. Thenceforth his affiliations were with the Whigs. He was a leading member of the Protectionist Convention at Harrisburg in 1827, was active in the Pennsylvania Constitutional Convention in 1837, and in 1841 was appointed by President Harrison First Comptroller of the Treasury. After the death of Harrison and the subsequent resignation of his Cabinet, Forward was appointed by President Tyler, in September, 1841, as Secretary of the Treasury; but as Tyler broke away more and more from the Whigs, his position became more difficult, and finally, in March, 1843, he resigned. From 1843 to 1849 he practiced his profession at Pittsburg; from 1849 to 1851, by appointment of President Taylor, was chargé d'affaires at Copenhagen, Denmark, and from 1851 to his death was president judge of the Allegheny County District Court.

FORWARDING. The business of receiving and transmitting goods. The forwarding merchant assumes the expense of transportation, and receives compensation from the owners. Such a person is not deemed a common carrier, but is merely a warehouseman or agent, and is required only to use ordinary diligence in sending the property by responsible persons, and to obey the in-

structions of his principal. Forwarding merchants have in the United States been superseded largely by express companies. Common carriers often act as forwarders of goods from points on their own line to other places. A person who holds himself out as a public forwarder is under a legal duty to receive and forward all goods tendered to him by any person for a reasonable compensation, unless he can show a valid excuse for his refusal or failure so to do. See CARRIER, COMMON.

FOSCARI, fôs'kà-rê, FRANCESCO (1372-1457). Doge of Venice from 1423 to 1457. Previous to his election he had acquired considerable reputation as the guardian of the young Marquis of Mantua, and as one of the procurators of San Marco. He was always an advocate of an aggressive policy on the Italian mainland, for the purposes of territorial aggrandizement, and he was elected to the Dogate as an exponent of such a policy. He soon entered upon a course of conquest, which continued, with intervals of peace, for nearly thirty years, and which, in spite of many defeats, resulted in the reduction of a large part of northern Italy under Venetian rule. In 1426-27, in league with Florence, Naples, Savoy, and many minor principalities, he carried on a conflict with the Visconti of Milan. As a result, Venice acquired the towns of Bergamo, Cremona, and Brescia. War broke out again in 1431; the Venetian forces suffered defeat; but in the treaty of peace the territories of the Republic were nevertheless extended to the Adda. Two years later hostilities were recommenced; this time Venice, Florence, Genoa, and the Pope were arrayed against Milan, Mantua, and Naples, and by the peace signed in 1441 Venice gained possession of Peschiera and other places. Hostilities were finally terminated by the Peace of Lodi, in 1454. In spite of his uniform success in Italy, Foscari was forced to meet bitter opposition at home. This was based mainly on the fact that, owing to the Italian wars, the influence of Venice had suffered greatly at the hands of the Turks in Greece and in the Grecian Archipelago. This opposition took the form of a cruel persecution of Foscari's youngest son, Giacopo, who, with his father, forms the subject of Byron's tragedy *The Two Foscari*. In 1444 Giacopo was denounced for having received bribes in order to use his influence in the disposal of State offices. He was tried by the Council of Ten and banished; but in 1447, on the Doge's petition, he was allowed to return, and he lived quietly at Venice for three years. In 1450 one of the Council of Ten was murdered, and suspicion fell upon Giacopo, who in the following year was tried, tortured, and banished to Candia, the Doge taking no part in the trial. There was great doubt about Giacopo's guilt, though he seems to have engaged in treasonable correspondence. He was again recalled, tried, and again banished. There was still so much uncertainty about his guilt that a movement to recall him had almost succeeded when his death was announced, in 1457. Foscari, worn out and broken-hearted, was soon after deposed illegally by the Council of Ten, through the machinations of his enemy, the Admiral Giacopo Loredano, who had been the chief instigator in the relentless persecution of the younger Foscari. He resisted at first, but yielded to force, and left the Doge's palace on Octo-

ber 24, 1457. He died on November 1st. Consult Brown, *Venice* (New York, 1893).

FOSCO, COUNT. A corpulent villain in Wilkie Collins's *Woman in White*. He combines fiendish relentlessness in the pursuit of his designs with a gentle tenderness for pet canaries.

FOSCOLO, fós'kò-lò, Ugo (1778-1827). An Italian writer, born at Zante, in the Ionian Isles, the son of a Venetian family then settled there. Originally called Niccolò, he early changed his name to Ugo. Part of his childhood was spent in Dalmatia with his father, a physician practicing at Spalato, and when this parent died he returned to Zante, whence, probably in 1793, he went to Venice. His education was continued in this city, and he made occasional visits to the University of Padua, but does not seem to have regularly matriculated there. With 1795 began his multitudinous love affairs (consult Chiarini, *Gli amori di Ugo Foscolo, etc.*, Bologna, 1892), an account of which could only bring out his inordinate vanity and fickleness. Fired with patriotic fervor, Foscolo served as an officer in armies of the several ephemeral Italian republics from 1796 on. To the period between 1799 and 1803 belong two of his best odes, those entitled "Luigia Pallavicini caduta da cavallo" and "All' amica risanata." He served in France, with the Italian division of the French Army, from 1804 to 1806, and spent some time at Boulogne-sur-Mer and at Valenciennes, where his natural daughter Floriana was borne to him by an English mother. Back in Italy in 1806, he was appointed to the chair of eloquence at the University of Pavia in 1808, and there he pronounced his inaugural discourse, "Dell' origine e dell' uffizio della letteratura," metaphysical in conception, but highly finished in form. He lost his post before long, when the chair of eloquence was abolished in all the Italian universities, and from that time on his life was marked by many vicissitudes and much suffering. A classical tragedy of his, the *Ajace*, was performed at Milan in 1811, and as it was supposed to contain some flings at Napoleon—formerly Foscolo's idol, but now his bane—the author was obliged to leave Milan. In 1813, when Napoleon's power declined, he returned to Milan, only to leave the place again when the Austrians regained control of it and his patriotic sentiments prevented him from taking the oath of allegiance to the foreigner. Self-exiled, he went to Switzerland, and then to England, where he was welcomed as a type of the fearless patriot. He lived at Kensington and in London, and in both places burdened himself with debts by his foolish lavishness. He was rescued from poverty and misery by his friend, Hudson Gurney, and died at Turnham Green. His remains were interred at Chiswick; but in 1871 the Italian Government had them transferred to Florence.

Beginning at an early date to write verses in both Italian and modern Greek, Foscolo rapidly approached excellence of composition in the former language, as is proved by the two odes mentioned above, and some exquisite sonnets produced between 1800 and 1803. *Tieste*, a youthful tragedy, was published at Venice in 1797, and was followed by the *Ajace* (1811), which was first published posthumously at Naples in 1828. Another tragedy, the *Ricciarda*, dealing with a mediæval subject, was performed at Bologna in 1813, and

published at London in 1820. The influence of Alfieri is clear in all these dramas, of which the *Ajace* alone has decided merits. By 1807 Foscolo had written his masterpiece, *I Sepolcri*, a poem of 295 hendecasyllables in blank verse, which in magnificently lyrical passages extols burial monuments as incentives to virtue and good deeds, since they commemorate those of the dead. Some of the inspiration for this work came to Foscolo from other poets. Many commentaries have been written upon it, one of the best being that of Ferrari in his school edition of the *Poesie di Ugo Foscolo* (Florence, 1891). Of *Le Grazie*, addressed to the sculptor Canova and intended to be a poetical history of art, only a fragment remains, first published by Orlandini (Florence, 1848), and since in the excellent edition of the *Poesie di Ugo Foscolo* by Chiarini (Leighorn, 1882). A passing notice may be given to the poetical *Epistola a Vincenzo Monti* (1804-06), the hymn *Alla nave delle Muse* (1806), and his numerous revisions of Greek, Latin, and French poems—as, for example, his translation of parts of the *Iliad*.

Although the *Sepolcri* is the best work of Foscolo, he owes his greatest fame to his prose works, and especially to his *Ultime lettere di Jacopo Ortis* (1798), a novel produced under the influence of Goethe's *Werther*, and unfortunate in its attitude with regard to suicide. As instances of Foscolo's well-developed critical powers, we have the inaugural discourse given at Padua, and his "Illustrazioni," furnished to an edition of the *Opere di R. Montecucoli* (Milan, 1807-09). His Italian translation of Sterne's *Sentimental Journey* was begun at Boulogne-sur-Mer. It was published under a pseudonym at Pisa in 1813, and republished in the *Hypercalypseos Didimi Clerici* (Zurich, 1815). In England he produced considerable prose. Thus, for an edition of Boccaccio's works (London, 1825) he wrote as a preface his *Discorso storico sul testo del Decamerone*, and for an edition of Dante's great poem he prepared an essay, *Sul testo della Commedia di Dante* (Brussels and London, 1842), which is a treatise of no little importance in the history of Dante studies. Foscolo also contributed articles to English magazines. Many of his letters are printed in the *Epistolaria*, prepared by Orlandini and Mayer for the edition of his works published at Florence (1850-62); others have been since edited by Tobler (Leipzig, 1871), and many more scholars.

FOSS, CORPORAL. In George Colman's *The Poor Gentleman*, the disabled soldier, the servant of Lieutenant Worthington. The character is

based on Corporal Trim, in Sterne's *Tristram Shandy*.

FOSS, CYRUS DAVID (1834—). An American clergyman of the Methodist Episcopal Church. He was born at Kingston, N. Y.; graduated at Wesleyan University in 1854, and entered the itinerant ministry of the Methodist Episcopal Church, in the New York Conference, in 1857. From 1857 to 1859 he was a pastor at Chester, Orange County, N. Y.; from 1859 to 1865 in Brooklyn, N. Y., and from 1865 to 1875 in New York, N. Y. He was president of Wesleyan University from 1875 to 1880, and in the latter year was elected a bishop. In 1878 he was delegate to the General Conference of the Methodist Episcopal Church South, held in Atlanta, Ga., and in 1886 to the British Wesleyan Conference, held in London, England. He made tours of the missions of his Church in Europe (1886), Mexico (1893), and India and Malaysia (1897-98), and wrote *From the Himalayas to the Equator* (1899).

FOSSA, or **FOUS-SA** (Malagasy). The largest carnivorous mammal of Madagascar, a slender, lithe creature, connecting the cats and civets and in structure partaking of both. It is about twice the size of a house cat, and has a very long, tapering tail, so that it measures fully five feet from tip of nose to end of tail. It is nearly uniformly pale brown in color, with the hair short and close and no spots. Each foot has five cat-like toes, the claws of which are sharp, curved, and retractile; but the soles of the hind feet are entirely naked, and rest upon the ground in walking. The dentition is a mixture of forms characterizing both the cats and the civets, the teeth numbering thirty-six in all. A separate family has been proposed for this strange carnivore by several zoologists; but it seems best to regard it as alone representing a group *Cryptoproctinae* within the civet family (*Viverridae*), under the name *Cryptoprocta ferox*. It seems to be confined to Madagascar, where it is not numerous; and although much dreaded by the natives, on account of its reputation for ferocity and ability to do harm, is rarely seen, since it is wholly nocturnal. It feeds upon small animals and birds, and occasionally invades poultry yards; but its general habits are little known.

FOSSA MARIANA (Lat., trench of Marius). The canal made B.C. 102, by Marius, from the Rhône to the Gulf of Stomolimne, near the modern village of Foz (*Fossa Marinæ*). It was constructed to avoid the difficult navigation at the mouths of the river, caused by the accumulations of sand by the several streams. It was about 16 miles long, and was later given to the inhabitants of Massilia (Marseilles), who derived large revenues from it.

FOSSANO, fôs-sâ'nô. A city in North Italy, 1240 feet above the sea, on the left bank of the Stura, 40 miles south of Turin (Map: Italy, B 3). The name Fossano, derived from the Latin *fons sana*, indicates the presence of much-visited mineral springs. The city has promenades on the site of the old walls, a fourteenth-century cathedral, a seminary, a gymnasium, and an academy of science. It manufactures silk fabrics, gunpowder, leather, paper, and baskets. Fossano was purchased by the House of Savoy in 1340, was the residence in the sixteenth century of Philibert Emmanuel and several of his successors,

and in 1796 and 1799 was the scene of battles between the French and the Austrians. Population, in 1881, of commune, 18,000; in 1901, 18,133.

FOSSANO, AMBROGIO. See BOGGOGNONE.

FOSSIL (Fr. *fossile*, from Lat. *fossilis*, dug up, fossil, from *fodere*, to dig; connected with Corn. *bedh*, Welsh *bedd*, grave, OChurch Slav. *bosti*, Lith. *badyti*, to pierce). Any remains or trace of the form of animals or plants found buried by natural causes in deposits or rocks before the present era. The term was formerly applied to anything dug up out of the ground, and included minerals, prehistoric implements, etc. At the present day the word is used as an adjective in this latter sense, and also to designate anything pertaining to prehistoric times. Thus, we read of fossil salt, fossil rain-drops and mud-cracks, and fossil lakes, deserts, sea-beaches, and shores. The word petrification is often incorrectly employed as a synonym for fossil, although it properly designates only such organic remains as have been turned to stone, as described below. Fossils are the relics of the animals and plants that have lived upon the earth and in the waters of the earth during the long periods of its geological history, and study of their organization, occurrence, and relations to each other and to modern organisms constitutes the science of paleontology (q.v.). Fossils are naturally absent from all rocks of igneous and volcanic origin, and, on the other hand, they are present originally in nearly all rocks of sedimentary origin. From large masses of these latter they have been obliterated by chemical and physical changes, so that they are now seldom or sparingly found in metamorphic rocks. The processes by which organic remains have been preserved are grouped under the term fossilization. This includes entombment and the subsequent changes that have ensued. The place of entombment may be on land, in fresh water, or in the salt water of bays, seas, or oceans.

The degree of preservation of fossils varies greatly. In some few cases the flesh of animals has been preserved as if in an ice-box. Mammoth carcasses embedded in the frozen mud cliffs of Siberia for thousands of years had meat so fresh that it was eaten by the dogs of the exploring party. The most perfectly preserved fossils are undoubtedly those insects found in the Tertiary amber of the Baltic Provinces, where the form, structure, and colors are retained intact. Then we find shells preserved in the rocks with their original organic matter replaced by some mineral, usually silica, or perhaps barytes, pyrites, or even zinc blende. Such replacements rightly receive the name of 'petrifications.' In other cases we find cavities in rocks, the sides of these retaining impressions of the outer and inner surfaces of shells which have been dissolved and destroyed by percolating waters. These 'molds' are sometimes filled with calcite, or quartz, or other mineral matter, and then we have 'casts' of the original organic forms. The study of these molds is puzzling to the beginner, because of the multiplication of forms so caused. A single shell like a limpet, if preserved in the rocks, may present four different aspects as a fossil—the outer and inner surfaces of the shell itself, and the molds of each of these. The mold of the outer surface may pull away such delicate spines

as may ornament the shell, and for this reason molds should always be carefully collected and treated with acid, after which the impression of the original shell surface is often shown with the utmost fidelity to detail. Another class of fossils consists of the impressions or trails made by animals crawling over the bottom of the water or over the beach, and also of burrows or casts of burrows that served as dwelling-places or passageways for worms, crustaceans, etc. The study of the footprints of reptiles and supposed birds, which are so abundant on the surfaces of the Jurassic sandstones of Massachusetts and Connecticut, was named ichnology by E. Hitchcock, who described and figured a host of such impressions. Similar footprints are found in rocks of shallow-water origin of Mesozoic and Tertiary age all over the world.

The parts of animals likely to be preserved are always those that resist longest the destructive agencies that may attack them both before and after their entombment. The soft parts are seldom preserved, and often also the hard parts are destroyed. Because of this certain groups of animals are represented by insignificant parts of their anatomy, which, though of great importance to the paleontologist, are usually laid aside by the zoölogist as of trivial interest. Thus, the presence of sponges in certain formations is demonstrated by their isolated spicules; holothurians are recognized by their minute calcareous plates and anchors; worms by their teeth and dwelling-tubes; dibranchiate cephalopods by their internal shells; and many fish by their teeth, ear-bones (otoliths), spines, and dermal scales.

The manner of entombment of fossils varies greatly. In many cases the shells of mollusks have been dead a long time, and have become incrustated with polyzoans and corals before they were entombed. In other cases they were washed along the shore and broken and worn by the waves so that now in fragmentary condition they form 'shell limestones.' Among the crustacean fossils we find those that were killed suddenly, perhaps by some change in the temperature of the water, in which case their remains are usually well preserved. In some rocks of fresh-water or estuarine origin certain layers are covered with the remains of fish. These evidently lived in shallow pools that were either dried up suddenly or became so heated by the sun that the fish were killed, soon to be covered by sediment. Such conditions are frequent in the Catskill, Old Red Sandstone, and Jurassic formations. Myriads of insects of Tertiary time became entangled in the soft gum of coniferous trees, and are now preserved in the amber of the Baltic and the fossil resins of Africa and New Zealand.

The old ideas regarding fossils were curious and often fantastic. A few of the Greek and Roman philosophers had well-defined ideas of their true nature as entombed animals and plants that had once lived in the sea and upon the earth; but the majority of early writers attached to them some fanciful or supernatural origin. Thus they were explained as due to the *vis plastica*, or creative force that formed living things out of inorganic materials; as sports of nature; as due to some peculiar fermentative process in the earth, or as originating in some unknown influence of the stars. Another hypothesis, maintained for centuries, and even now persisting in uneducated

communities, explains fossils as the remains of animals and plants washed up on the land, and there stranded by the waters of the Noachian deluge. These erroneous ideas persisted in the face of true explanations by some observers, until the beginning of 1800, when slowly the true nature of fossils and their relations to the rocks in which they are entombed began to be more universally understood, and at last during 1800 to 1840 there were laid the foundations of the science of paleontology.

For further information on the early ideas regarding fossils, consult: Lyell, *Principles of Geology*, vol. i. (New York, 1872); Von Zittel, *History of Geology and Palæontology*, translated by Ogilvie-Gordon (London and New York, 1901). For modes of fossilization and the relations between fossils and the rocks containing them, consult: Geikie, *Text-Book of Geology* (London and New York, 1893); White, "The Relations of Biology to Geological Investigation," in *Smithsonian Institution Report of the United States National Museum for 1892* (Washington, 1894); Marr, *Principles of Stratigraphical Geology* (Cambridge, 1898); Schuchert, "Directions for Collecting and Preparing Fossils," in *Smithsonian Institution United States National Museum, Bulletin No. 39* (Washington, 1895). See also PALEONTOLOGY; PALEOBOTANY; GEOLOGY.

FOSSIL BOTANY. See PALEOBOTANY.

FOSSIL FOOTPRINTS. See ICHNOLOGY.

FOSSIL FORESTS. The popular term applied to groups of petrified tree-trunks. Such forests may be found at the locality and in the position in which they grew, or, what is more frequently the case, they may have been carried some distance from their native soil before being buried and silicified. Fossil trees are not uncommon in the coal measures of the United States; but the most celebrated examples, belonging to more recent geological periods, are those of Arizona and the Yellowstone Park. Along the Little Colorado River, in Arizona, there are great numbers of well-preserved trees, scattered over the surface, some of which attain a diameter of 5 feet, and a length of more than 50 feet. The wood-cells have been replaced by silica, which is either colorless, like quartz, or shows the beautiful tints of agate, opal, and jasper; the structure of the wood is preserved to a most remarkable degree. Heavy beds of Triassic marls cover the surface, and it is in this formation that the trees are found. The silicification was probably accomplished by hot alkaline waters, carrying dissolved silica; there is evidence of volcanic activity in the region which might well give rise to thermal springs. Many of the trees have been removed for cutting and polishing into various artistic objects, rivaling onyx and the rarer marbles in delicacy of color, and this wholesale destruction has given much concern lest the forest be entirely destroyed. A similar fossil forest in the Yellowstone Valley has many erect stumps of large size. Along the shore of Chesapeake Bay, south of Baltimore, is a forest in which the giant trunks of cypress rise from a bed of peat that is covered by Pleistocene clays. The Bad Lands of the Little Missouri abound in petrified trees which have been washed out from shales and sandstones of the Laramie group. Another forest, remarkable for the great size of its trees, is found in

Napa County, Cal. In England fossil trees were laid bare at Parkfield Colliery, near Wolverhampton, in 1844. Within the space of one-fourth of an acre there were 73 stumps with attached roots, the trunks lying prostrate in every direction. The wood was converted into coal. Silesia, Egypt, and the island of Antigua, in the West Indies, also have fossil forests. Consult: Marsh, *American Journal of Science* (New Haven, 1871); Hague and others, "Geology of the Yellowstone National Park," *United States Geological Survey, Monograph 32* (Washington, 1899).

FOSSILIFEROUS ROCKS (from Lat. *fossilis*, dug up, fossil + *ferre*, to bear). Rocks which contain organic remains. If we except the lowest metamorphic rocks of the Algonkian system, in which, as yet, no undoubted fossils have been found, the term is equivalent to 'stratified rocks,' and 'sedimentary rocks,' when used comprehensively; but it may also be applied to a particular bed, barren of organic remains, as in case of an unfossiliferous sandstone compared with a neighboring fossiliferous shale or limestone.

FOSSIL INVERTEBRATES. See PALEONTOLOGY.

FOSSIL PLANTS. See PALEOBOTANY.

FOSSIL VERTEBRATES. See PALEONTOLOGY.

FOSSOMBRONE, fôs'sôm-brô'nâ. A city in central Italy, 44 miles northwest of Ancona by way of Fano, on the ancient Via Flaminia. A noteworthy feature is its cathedral containing a fifteenth-century altar by Domenico Rosselli. The city has a gymnasium, technical schools, and important silk industries. In the vicinity are ruins of the Roman colony Forum Sempronii, which was destroyed by the Goths and Lombards; the hill of Pietralata, sometimes called Monte d'Asdrubale, where, according to tradition, the battle of the Metaurus took place in B.C. 207; and Furlo Pass, a tunnel, 96 feet long, 17 feet wide, and 14 feet high, hewn through the solid rock, as the inscription shows, by Emperor Vespasian in A.D. 76. Population, in 1881, of commune, 9100; in 1901, 10,428.

FOSSOMBRONI, fôs'sôm-brô'nê, VITTORIO (1754-1844). An Italian statesman and scientist, born at Arezzo. He studied at the University of Pisa, and after holding various other offices in the Grand Duchy of Tuscany, became Minister of Foreign Affairs (1796). When Tuscany was converted into the Kingdom of Etruria (1801), he refused office in the Council of State, but acted as Commissioner of Finance and proposed a scheme of monetary reform. In 1805 he became lieutenant-general of the Tuscan troops, and held high office under the French régime. He was a Senator of the Empire and president of a commission appointed by Napoleon to devise means of sanitation in Rome and the Pontine Marshes. When the grand duchy was reestablished, in 1814, Fossombroni was made Prime Minister and president of the Legislature. Here his main work was putting the Tuscan finances on a sound footing. His published works are: *Sur les équations irréductibles au troisième degré* (1778); *Sur l'intensité de la lumière* (1782); the very important *Memorie idrolico-storiche sopra le val di Chiana* (1789); *Sur l'équation conditionnelle* (1794); *Sur le principe de la vé-*

locité virtuelle (1796); and *Sur l'amélioration des marais Pontins* (1805).

FOSS-WAY, or **FOSSE**, THE. A road in England, built by the Romans. It ran probably from the seacoast at Seaton in Devonshire to Lincoln, with a continuation northward to the Humber, known as 'High Street.' The earliest mention of the Foss is in some Anglo-Saxon charters dating from the eighth century, and travelers along it enjoyed from early times the special protection known as the King's Peace. This sanctity it enjoyed together with the other three so-called Roman ways: Watling Street, Icknield Street, and Ermine Street. There can be no doubt that the Foss was constructed early during the Roman occupation in order to facilitate that easy communication so necessary for the military control of the island. It was still in good condition in the twelfth century, but has now almost disappeared. Consult Guest, "The Four Roman Ways," in *Origines Celticae* (London, 1883).

FOSTER, ABBY KELLEY (1811-87). An American reformer, born of Quaker parentage, at Pelham, Mass. After attending the Friends' School at Providence, R. I., she taught for several years in various Massachusetts towns. In 1837 she gave up teaching, and delivered a series of lectures in favor of the abolition of slavery. She was the first woman who had ever appeared before mixed audiences as an advocate of anti-slavery principles, and although she was the object of considerable harsh criticism, and was compelled to suffer indignities and rough treatment, her attempt met with considerable success. In 1845 she married Stephen Symonds Foster (q.v.), the abolitionist, and for several years they continued their speaking tours together. Afterwards she became an advocate of prohibition and woman's suffrage.

FOSTER, ANTHONY. The miserly custodian of Amy Robsart, at Cumnor Hall, in Scott's novel *Kenilworth*. He assists in her murder, but meets his reward by accidentally shutting himself in a secret chamber, in which he starves to death. Ashmole's *Antiquities of Berkshire* do not agree with Scott's account of Foster's death, but state that after the murder he pined away and died of remorse.

FOSTER, SIR AUGUSTUS JOHN (1780-1848). An English diplomat. Through his mother's influence (she had married the Duke of Devonshire after the death of John Thomas Foster) he was made secretary of the English legation at Naples, and in 1811 was sent to the United States as Minister. At the outbreak of the war he returned to England and was elected member of Parliament. Two years later he was made Minister at Copenhagen; passed ten uneventful years there, and in 1824 went to Turin, where he stayed until 1840 and then retired. He committed suicide on August 1, 1848, probably being deranged at the time.

FOSTER, BENJAMIN. An American landscape painter, born at North Anson, Maine. He was a pupil of Abbott Thayer in New York City, and of Olivier Merson and Aimé Morot in Paris. He is particularly successful with the misty effects of early morning and evening, and moonlight nights, and his pictures usually represent such subjects. His "Mists of the Morning" (1901) obtained the Webb prize. He received a

medal at the Columbian Exposition of 1893, a bronze one at the Paris Exposition of 1901, a silver medal at Carnegie Institute, Pittsburgh, 1900, and another at the Pan-American Exposition of 1901. His night scene at the Paris Exposition was purchased by the French Government for the Luxembourg Gallery.

FOSTER, BIRKET (1825-99). An English painter and engraver, born at North Shields, February 4, 1825. Early apprenticed to E. Landell, a wood-engraver, he devoted some years to illustrating, and also engraved plates for Gray's *Elegy*, *The Ancient Mariner*, *Old English Ballads*, and Longfellow's *Evangeline*. He drew for the *Illustrated London News*, and was for a time represented in the early numbers of *Punch*. About 1859 he began drawing in water-colors, and in 1862 was made a member of the Society of Painters in Water-Colors. His choice of subjects was drawn mostly from rural life, and he especially emphasized the landscape element. He became very popular, and his works were much reproduced in photographs and chromos. Among those well known are "Nutting," "The Bird's Nest," "Sailing the Boat," "Cows in the Pool," "Feeding the Ducks," "Arundel Mill," "Castle of Rheinfels," etc. At a later period he also painted in oils, but not with equal success. Consult: Hulsh, *Birket Foster: His Life and Work* (London, 1890); Scherer, *The Birket Foster Album* (Münich, 1890).

FOSTER, CHARLES (1828-1904). An American politician and Secretary of the Treasury. He was born near Tiffin, Ohio. He was educated at Norwalk Academy, and entered his father's store, becoming a partner, and finally succeeding to the control of the business, which under his efficient management became one of the largest retail and wholesale mercantile establishments in the State. In connection with this business he established a bank, and dealt largely in grain and produce. During the Civil War he actively aided in the recruiting and equipment of the Ohio troops. It was not until 1870 that he entered political life. In that year he was nominated by the Republicans of his district for Congress, and was elected. He was reelected in 1872, 1874, and 1876. In the winter of 1874-75 he visited New Orleans as chairman of a sub-committee of Congress appointed to examine into frauds in Louisiana. In 1879 he was nominated for Governor of Ohio, and was elected by 17,000 majority, and two years later, in 1881, was reelected, serving until January 1, 1884. His administration was marked by reforms in the management of State institutions, and by an attempt to reform the taxation of the liquor traffic. In 1889 Foster was appointed by President Harrison chairman of a commission to draw up a treaty with the Sioux Indians. In February, 1891, he succeeded William Windom as Secretary of the Treasury in Harrison's Cabinet.

FOSTER, FRANK HUGH (1851—). An American clergyman of the Congregational Church. He was born in Springfield, Mass., graduated at Harvard in 1873, from 1873 to 1874 was assistant professor of mathematics in the United States Naval Academy, and in 1877 graduated at Andover Theological Seminary and was ordained to the Congregational ministry. In 1877-79

he was pastor at North Reading, Mass.; in 1879-82 studied at Göttingen and Leipzig; and from 1882 to 1884 was professor of philosophy in Middlebury College. In 1884 he was appointed professor of Church history in the Oberlin Theological Seminary; and in 1892 was chosen professor of systematic theology in the Pacific Seminary, Berkeley, California. He was at various times an editor of the *Bibliotheca Sacra*; associate editor of Jackson's *Concise Dictionary of Religious Knowledge and Gazetteer* (1891); and contributed to Jackson's *Huldreich Zwingli* (1901).

FOSTER, GEORGE BURMAN (1858—). An American theologian, born at Alderson (Monroe County), W. Va. He graduated in 1883 at West Virginia University (Morgantown, W. Va.), at the Rochester (N. Y.) Theological Seminary in 1887, and was pastor of the First Baptist Church of Saratoga Springs (Saratoga County), N. Y., from 1887 to 1891. In 1891-92 he studied at the universities of Göttingen and Berlin, from 1892 to 1895 was professor of philosophy in McMaster University, and in 1895 was appointed to the chair of systematic theology in the University of Chicago.

FOSTER, GEORGE EULAS (1847—). A Canadian political leader. He was born in Carleton, New Brunswick, and graduated at the University of New Brunswick in 1868. For three years he taught school at Fredericton, and in 1871 was appointed to the chair of history and classics in his *alma mater*, spending two years in study at Edinburgh and Heidelberg before entering upon his duties. He resigned his professorship in 1879, and after two years spent in lecturing on temperance problems in Canada and the United States, he entered politics, and was returned in 1882 to the Dominion House of Commons as a Liberal-Conservative from Kings County, New Brunswick. His scholarship and his fluency as a speaker won him early recognition, and in December, 1885, he entered Sir John A. Macdonald's Cabinet, as Minister of Marine and Fisheries. In this office he was called upon to prepare the case for Canada to be presented to the joint commission in Washington which had been appointed to settle the long-standing dispute over the deep-sea fisheries. His brief for Canada was an able presentation, and left its impress on the Bayard-Chamberlain Treaty of 1888. In May, 1888, he succeeded Sir Charles Tupper as Minister of Finance, and continued to hold this portfolio in all the succeeding Cabinets until the fall of the Conservative Party from power in January, 1896. He is an ardent champion of British Imperial federation.

FOSTER, HENRY (1796-1831). An English navigator. He entered the navy in 1812; accompanied the commission on the northwest boundary between the United States and British North America, and made surveys of the mouth of the Columbia. In 1819-20 he sailed to South America, and began his important observations with the pendulum. He was a member of the expedition to Greenland and Norway in 1823; and in the following year, and again in 1827, sailed with Parry on his northwestern and polar voyages. The results of his observations on the variation of the needle were printed in the *Philosophical Transactions* (1826), and he received the Copley medal and the grade of commander for this work. In 1828 he started for

the South Seas to make pendulum observations and to study ocean currents and meteorology. He rounded Cape Horn after observations near Montevideo, touched on the South Shetland Islands, and after much cruising landed at Panama, and measured by rockets the meridian distance between Panama and Chagres. He was drowned in the river Chagres a day or so after. His note-book was stolen, but his other papers were published by Webster in a *Narrative of a Voyage to the Southern Atlantic Ocean* (1834).

FOSTER, ISAAC (1740-81). An American physician and surgeon, born in Charlestown, Mass. He graduated at Harvard in 1758, studied medicine in Paris and London, and returned to practice at Charlestown. He was a delegate to the first Provincial Congress of Massachusetts in October, 1774, and on the outbreak of the Revolution he gave up his large practice and joined the Continental Army as a volunteer surgeon. In the fall of 1775 he was appointed by Washington acting director-general of the military hospital service of the American forces. He remained in the service after the appointment of Dr. John Morgan to that position by Congress, was personally attached to Washington's headquarters, and in 1777 was surgeon-in-chief of the Eastern Department of the Continental armies. He resigned in 1780 on account of failing health.

FOSTER, JOHN (1770-1843). An English essayist, son of a weaver, born in the parish of Halifax, Yorkshire, and educated for the ministry at the Baptist college in Bristol. After preaching for several years to small congregations, he resolved to devote himself mainly to literature. In 1805 appeared his popular *Essays, in a Series of Letters*. The volume contained four essays, entitled: "On a Man's Writing Memoirs of Himself," "On Decision of Character," "On the Application of the Epithet Romantic," and "On Some of the Causes by which Evangelical Religion has been rendered less Acceptable to Persons of Cultivated Tastes." In 1808 Foster married a Miss Snooke, to whom his essays were addressed, and retired to Bourton, a village in Gloucestershire, where he lived a studious life, preaching, however, in the neighboring villages on Sundays. In 1820 appeared his celebrated *Essay on the Evils of Popular Ignorance*, in which he urges the necessity of a national system of education. To the *Eclectic Review* he contributed nearly two hundred articles. He died at Stapleton, near Bristol. Consult his *Life and Correspondence*, edited by Ryland (London, 1846; republished in Bohn's Library, 1852).

FOSTER, JOHN GRAY (1823-74). An American soldier, born at Whitefield, N. H. He graduated at West Point in 1846, and served with the rank of brevet second lieutenant in the southern campaign of the Mexican War. From 1855 to 1857 he was principal assistant professor of engineering at West Point, and between 1857 and 1861 served as superintending engineer of the survey of the site of the fort at Willets Point, N. Y., and of the construction of Fort Sumter and the repairing of Fort Moultrie in Charleston Harbor. On December 26, 1860, he received the brevet of major for his part in transferring the Federal garrison from Fort Moultrie to Fort Sumter, and on April 12-13 he assisted in the defense

of the latter fort. He then acted as superintending engineer of the construction of the fort on Sandy Hook, N. J., from May to November, 1861; was raised to the rank of brigadier-general of volunteers in October, 1861; and commanded a brigade during General Burnside's North Carolina expedition of January to July, 1862, receiving the brevet of colonel. He became a major-general of volunteers in July, 1862; and from July, 1862 to July, 1863, was in command of the Department of North Carolina. From July to November, 1863, he commanded the Department of Virginia and North Carolina, and from December, 1863, to February, 1864, the Army and Department of the Ohio, and was brevetted brigadier-general and major-general in the Regular Army. He was in command of the Department of the South from May, 1864, to February, 1865, and of the Department of Florida from August, 1865, to December, 1866; was mustered out of the volunteer service in September, 1866, and subsequently, until his death, was engaged as lieutenant-colonel of engineers on various important engineering works for the Government, notably the improvement of Boston Harbor and the construction of the defenses in Portsmouth Harbor. In addition to a number of magazine articles, he published *Submarine Blasting in Boston Harbor* (1869).

FOSTER, JOHN WATSON (1836-). An American diplomat, born in Pike County, Ind. In 1855 he graduated at the Indiana State University. At the beginning of the Civil War he entered the Union service as a major of volunteers, and after attaining the rank of colonel headed a brigade in General Burnside's expedition to East Tennessee, and was the first to occupy Knoxville (1863). In 1873-80 he was Minister to Mexico, in 1880-81 Minister to Russia, and in 1883-85 Minister to Spain. In 1891 he was engaged as a special agent to assist President Harrison and Secretary Blaine in the negotiation of reciprocity treaties, in which capacity he assisted in settling the dispute with Chile. During the Bering Sea controversy he acted as agent to prepare and conduct the case of the United States before the arbitration tribunal. Upon the death of Mr. Blaine General Foster succeeded to the Secretaryship of State (1892-93). Later he was legal adviser to the Chinese plenipotentiaries in their peace negotiations with Japan (1895); again represented the United States in the Bering Sea question (1897); and in 1898 was a member of the Anglo-American Joint High Commission to settle the disputes between Canada and the United States. Besides numerous magazine articles, he published *A Century of American Diplomacy* (1900).

FOSTER, JOHN WELLS (1815-73). An American geologist and paleontologist. He was born at Brimfield, Mass., and graduated at Wesleyan University, Middletown, Conn., in 1834. He removed to Ohio, studied law, and was admitted to the bar at Zanesville; but having spent his leisure in the study of geology, he accepted a position as assistant in the Geological Survey of Ohio in 1837, and was employed until 1844 in investigating the coal-beds of the State. In 1844 he returned to Massachusetts. In 1847 he was assigned with Josiah Dwight Whitney (q.v.) to assist Prof. Charles T. Jackson in a geological survey of the Lake Superior region. Foster and

Whitney completed the work alone, and the results of their investigations were published by authority of Congress as *A Synopsis of the Explorations of the Geological Corps in the Lake Superior Land District in the Northern Peninsula* (1849), and *Report on the Geology and Topography of a Portion of the Lake Superior Land District in the State of Michigan: Part I., The Copper Lands* (1850); *Part II., The Iron Region* (1851). For the next few years Foster remained in Massachusetts, where he was active in the 'Native American' movement, and was associated with Henry Wilson in the organization of the Republican Party in the State. In 1858 he removed to Chicago, where he lived for the remainder of his life, for some years holding the chair of natural philosophy in the old University of Chicago, and devoting himself to scientific investigation, in particular to the paleontology and ethnology of the Mississippi Valley. He was president of the American Association for the Advancement of Science (1869). Among his later published works are: *The Mississippi Valley* (1869); *Mineral Wealth and Railroad Development* (1872); and *Prehistoric Races of the United States* (1873).

FOSTER, JUDITH ELLEN (HORTON) (1840—). An American lecturer, born at Lowell, Mass. She removed to Iowa, studied law, and was admitted to the State bar in 1872. She also became superintendent of the Legislative Department of the Woman's Christian Temperance Union, and when that organization was affiliated with the Prohibition Party, identified herself with the Non-Partisan Woman's Christian Temperance Union, to whose presidency she was elected. She has been known as a popular lecturer on various topics, and has published a *Constitutional Amendment Manual* (1882).

FOSTER, LAFAYETTE SABINE (1806-80). An American political leader and legislator. He was born in Franklin, Conn., and graduated at Brown University in 1828. He studied law, settled at Norwich, and took an active part in politics as a Whig. He was elected to the Connecticut Legislature in 1839 and 1840, and was chosen to its sessions of 1846, 1847, and 1848, in the latter two sessions acting as speaker of the Assembly. In May, 1854, he was elected to the United States Senate by the combined votes of Whigs and Free-Soil Democrats. In 1856 he joined in the movement for the organization of the Republican Party, and in 1860 was reelected to the Senate as a Republican. During the entire Civil War period he was chairman of the important Committee on Foreign Affairs, and was often consulted by President Lincoln. In 1865 he was chosen president *pro tempore* of the Senate, and on the death of Lincoln and the succession of Johnson he became, according to the Constitution, the acting Vice-President of the United States. He declined to be a candidate for reelection in 1867, became a Liberal Republican in 1872, and two years later he was an unsuccessful candidate for Congress on the Democratic ticket. He was a judge of the Connecticut Superior Court from 1870 to 1876, and in 1878-79 was a commissioner to settle the New York-Connecticut boundary dispute.

FOSTER, Sir MICHAEL (1836—). An English physiologist, born at Huntingdon. He was educated at University College, London, and in

1869 became professor of practical physiology there. A year afterwards he accepted a similar position at Trinity College, Cambridge, and in 1883 was appointed professor of physiology at the University of Cambridge. In 1899 he was president and afterwards was elected secretary of the British Association; and in 1900 he was elected to Parliament as representative of London University. His publications include: *Report on Modern Microscopes* (1867); *Primer of Physiology* (1874); *Studies from the Physiological Laboratory in the University of Cambridge* (1876-77); *A Text-Book on Physiology* (1877); *The Elements of Embryology* (1874), with F. M. Balfour; and *Course of Elementary Practical Physiology* (1876), with J. N. Langley.

FOSTER, RANDOLPH SINKS (1820-1903). An American clergyman of the Methodist Episcopal Church, born at Williamsburg (Claremont County), Ohio. He studied at Augusta College (Milledburg, Ky.), and entered the itinerant ministry of the Methodist Episcopal Church in the Kentucky conference in 1837. Subsequently he was transferred to the Ohio and New York conferences, from 1857 to 1860 was president of the Northwestern University (Evanston and Chicago, Ill.), and from 1860 to 1862 held pastorates successively in New York City and Ossining, N. Y. In 1868 he became professor of systematic theology in Drew Theological Seminary (Madison, N. J.), and in 1872 president of that institution. He was elected a bishop in 1872, and made visits to the missions of his Church in South America (1874), Germany and Scandinavia (1874 and 1883), India (1882), Italy (1883), and Mexico (1886). His publications include: *Objections to Calvinism as It Is* (1848); *Christian Purity* (1869); *Centenary Thoughts* (1884); *Beyond the Grave* (1879); *Union of Episcopal Methodisms* (1892); *Philosophy of Christian Experience* (1890); *Studies in Theology* (6 vols., 1889-99).

FOSTER, Sir ROBERT (1589-1663). An English jurist, the youngest son of Sir Thomas Foster, a judge under James I. He was called to the bar in 1610; was knighted and made a justice of common pleas in 1640. An eager upholder of Charles, he condemned Captain Turpin (1644), but was merely removed from office by Parliament, while his colleague was impeached for high treason. During the Commonwealth he practiced as a conveyancer, and on the Restoration he was appointed Chief Justice of the King's Bench (1660), and dealt as sternly with sectaries and political prisoners as if he had not himself enjoyed great toleration under Cromwell. He urged the King to approve the execution of Sir Harry Vane, and was justice at the trial of Sir Charles Sedley in 1663.

FOSTER, STEPHEN COLLINS (1826-64). An American song composer, born at Lawrenceville, near Pittsburg, Pa. Foster's musical gifts seem to have been natural, as he taught himself the flageolet when he was but seven. Many of his songs, the first of which, "Open Thy Lattice, Love," was published in 1842, have become so popular that they may be regarded as veritable folk-songs; for which reason it is fortunate that, although simple in technical treatment, they are, as a rule, refined and graceful in their melody. "Louisiana Belle," "Old Uncle Ned," "My Old Kentucky Home," "Massa's in the Cold, Cold

Ground," "Ellen Boyne," the famous "Old Folks at Home" ("Down on the Suwanee River"), "Come Where My Love Lies Dreaming," are some of the most popular of Foster's 175 published songs. His last song was "Beautiful Dreamer." Foster was improvident, and notwithstanding the enormous sales of his songs (e.g. "Old Folks at Home," 300,000 copies), was frequently harassed for want of money, and obliged to sell his manuscripts outright for pitifully small prices. He died in New York.

FOSTER, STEPHEN SYMONDS (1809-81). An American abolitionist, born at Canterbury, N. H. He followed the carpenter trade for several years, then entered Dartmouth College with the intention of preparing for the ministry, and graduated in 1838. While studying at the Union Theological Seminary he became imbued with abolitionist ideas, and determined to give up the ministry and become an anti-slavery advocate. This decision he followed, and soon became widely known as an earnest and fearless orator. The refusal of the churches to coöperate in the abolition movement aroused his indignation, and he bitterly denounced both churches and clergy as hypocritical and non-Christian. His radicalism caused him frequently to be attacked by mobs, and his method of appealing to the people by entering churches during service and addressing the audiences unannounced gave rise to numerous grave disturbances and precipitated several riots. In 1845 he married Abby Kelley (see **FOSTER, ABBY KELLEY**). Besides numerous articles on the slavery question in magazines, he published *The Brotherhood of Thieves: A True Picture of the American Church and Clergy* (1843, reprinted 1886).

FOSTER, THEODOSIA TOLL (1838—). An American author, born at Verona, N. Y., and educated at Oneida Seminary. She married James H. Foster in 1869, and for many years was principal of the Home School at Verona. She has written her many stories under the pen name of "Faye Huntington," including *Mr. McKenzie's Answer* (1876); *Ripley Parsonage* (1877); *From Different Standpoints*, with Mrs. Alden (1878); *Echoing and Re-Echoing* (1879); *Mrs. Deane's Way* (1880); *Millerton People* (1884); *What Fide Remembers* (1885); *The Boynton Neighborhood* (1895); *A Modern Exodus* (1897); *His First Charge* (1897); and *Lewis Elmore, Crusader* (1898).

FOSTORIA. A city in Seneca and Hancock counties, Ohio, near the boundary line of Wood County. 35 miles south by east of Toledo; on the Baltimore and Ohio, the Lake Erie and Western, and three other railroads (Map: Ohio, C 3). It is the seat of the Ohio Normal University. Fostoria was settled by the father of Charles Foster, Governor of Ohio and Secretary of the United States Treasury in 1891-93, and by the latter was built up and made an important manufacturing place. It has several glass-factories, flour-mills, brass and iron works, a carriage-factory, spoke and bending works, planing-mills, stave and barrel factories, carbon-works, a safe-factory, etc. In the vicinity are oil-fields and a productive farming section. The government, under a charter of 1889, is vested in a mayor, biennially elected, and a city council. The water-works are owned and operated by the municipality. Population, in 1890, 7070; in 1900, 7730.

FOTHERGILL, fōth'ēr-gil, JESSIE (1856-91). An English novelist, born in Manchester, where her father was a wealthy cotton manufacturer. Her first novel, *Healey*, was published in 1875, and her great success, *The First Violin*, in 1877. Her novels, most of which depict life on the moorland and in the factory towns of the north of England, are remarkable for their powerfully drawn studies of character. Her published books, besides those mentioned, include: *Aldyth* (1876); *The Well-fields* (1880); *Kith and Kin* (1881); *Made or Marred* (1881); *One of Three* (1881); *Peril* (1884); *Borderland* (1886); *The Lass of Leverhouse* (1888); *A March in the Ranks* (1890); and *Oriole's Daughter* (1893). A dramatization of *The First Violin* by Sidney Bowkett has been successfully produced.

FOTHERGILLIA, fōth'ēr-gil'ī-ā. A variety of *Nerine curvifolia* grown in conservatories to a slight extent for its numerous brilliant red flowers, which are borne in umbels on long scapes. The flowers are especially attractive on account of their glistening in the light, as if sprinkled with hoar frost. Owing to the habit of making growth during the winter and blossoming during the autumn, this plant, like others of its genus, will not become popular as a florist's flower, but will be grown only in private greenhouses. See Colored Plate of **AMARYLLIDACEÆ**.

FOTHERGILL PROCESS. A process in photography which has for its object the preservation of sensitive plates ready for exposure. It consists in the partial removal of the free silver nitrate which adheres to the collodion film when it is withdrawn from the sensitizing bath by washing with water, and the subsequent conversion of the remaining free silver nitrate into silver aluminate and chloride by pouring over the plate dilute albumen containing ammonium chloride, the excess of the albumen being finally washed off with water. The plates are set aside to drain on folds of blotting-paper, and when dry are ready for use.

FOTHERINGAY, fōth'ēr-īn-gā, THE. The stage name of Emily Costigan (q.v.), in Thackeray's *Pendennis*.

FOTHERINGAY CASTLE. A famous castle which once stood near Peterborough, Northampton, England. It was built in 1405, and was the birthplace of Richard III. in 1452, and the place of execution of Mary, Queen of Scots. It was demolished by James I. Its site is at present occupied by a church noteworthy for its admirable architecture, belonging to the Perpendicular period.

FOUCAULT, fō'kō', JEAN BERNARD LÉON (1819-68). A French physicist. He was born in Paris and was educated for the medical profession. His early physical researches were carried on in connection with Fizeau, and the first direct measurements of the velocity of light were due to independent researches by these physicists. In 1850, in the course of his experiments, Foucault proved that the velocity of light in air was greater than in water. His apparatus consisted of a plane mirror capable of rapidly revolving about a vertical axis, and a concave mirror to which the light was reflected from the first mirror. An achromatic lens, a transparent mirror to reflect the light on to an eye-piece, and a source of light comprise the other essential features of the ap-

paratus, which differed from that of Fizeau's in that it could be entirely contained in a laboratory, and did not involve the reflection of the beam of light from a mirror far distant. In 1851 he demonstrated the rotation of the earth on its axis by the diurnal rotation plane of oscillation of a long pendulum with a heavy weight. The following year he invented the gyroscope (q.v.). In 1854 he was appointed physicist at the Paris Observatory. In 1857 he invented the polarizing prism known by his name, and in 1858 succeeded in giving to the mirrors of reflecting telescopes the form of a spheroid or a paraboloid of revolution. He adjusted the great reflector in the telescope of the Paris Observatory in 1859. In 1865 he published a series of papers on a modification of Watt's governor, showing how its period of revolution could be made constant, and on an apparatus for regulating the electric light. He also showed how the sun can be observed without injury to the eye from the excess of light. He was scientific editor of the *Journal des Débats* from 1845. In conjunction with Regnault he published an important paper on binocular vision. He received the decoration of the Legion of Honor in 1850, and was made an officer in 1864. For his biography consult: *Léon Foucault, sa vie et son œuvre scientifique* (Brussels, 1879); and Lissajous, *Notice historique sur la vie et les travaux scientifiques de Léon Foucault* (Paris, 1875).

FOUCAULT CURRENTS, or **EDDY CURRENTS**. Induced currents of electricity generated in a plate or other mass of metal by its motion with regard to a magnetic field or by variations of that field. These currents circulate entirely within the metal, and their energy is expended in generating heat. They are known as Foucault currents, after this famous physicist, who demonstrated that when a copper disk was rotated between the poles of a strong electro-magnet its temperature was greatly increased, though the currents thus produced had been previously observed by other investigators. They play an important part in electrical work, and their effect was first noticed in the construction of compasses where it was found that the magnetic needle would come to rest much quicker when it was placed above a plate of metal. That the currents were due to induction (q.v.) was shown by Faraday, and Foucault and others constructed interesting apparatus to exhibit their action. In the galvanometer a useful application is found when it is desired to damp the vibrations of the magnetic needle, so that it will return to a point of rest quickly through the action of the magnetic field generated by the induced currents in surrounding plates or masses of metal. The most important effects of Foucault currents occur perhaps in dynamo-electric machinery (q.v.), and in the armatures of dynamos and motors and the cores of transformers a laminated form of construction is employed and the different parts separated from each other, so that there will be no currents circulating as the armature revolves or the alternations of current occur. The greatest care in the design and construction is necessary in such cases in order to prevent the generation of a large amount of heat. See **DYNAMO-ELECTRIC MACHINERY**; **ELECTRICITY**; **INDUCTION**; **MAGNETISM**; **TRANSFORMER**.

FOUCAUX, fōō'kō', MARIE FILON (1842—). A French author, the wife of Philippe Edouard Foucaux. Under the pseudonym of Mary Summer she wrote several works on Sanskrit literature, including: *Histoire du Bouddha Sākya-Mouni* (1874); *Contes et légendes de l'Inde ancienne* (1878), a work which was crowned by the Academy; and *Les héroïnes de Kālidāsa et les héroïnes de Shakespeare* (1879). She also wrote several studies and romances of the Empire and the Restoration, among which are: *Le dernier amour de Mirabeau* (1877); *Les belles amies de M. de Talleyrand* (1880); and *Une intrigante de la Restauration* (1888).

FOUCAUX, PHILIPPE EDOUARD (1811-94). A French Orientalist, born at Angers. He was a pupil in Sanskrit of Eugene Burnouf at Paris, and directed a course in Thibetan at the Bibliothèque Royale. In 1852 he was appointed to occupy temporarily the chair of Sanskrit literature in the Collège de France, and in 1862 succeeded Burnouf as titular professor. His publications include: *Grammaire de la langue thibétaine* (1859); *Onze épisodes du Mahābhārata* (1861); and *Le religieux chassé de la communauté* (1873).

FOUCHÉ, fōō'shā', JOSEPH, Duke of Otranto (1759-1820). A French politician and Minister of Police. He was born at Pellerin, in the Department of Loire-Inférieure, May 21, 1759. His father was a merchant captain, and the son was educated with a view to following the same calling; but early in life young Fouché decided for the Church, and after attending the Oratory at Paris, became a teacher at Juilly, Arras, and Vendôme, successively. In 1789 he had risen to be principal of the Collège of Nantes. As soon as the Revolution seemed likely to succeed, Fouché threw aside his ecclesiastical habit and had himself elected a deputy to the National Convention (1792) from Loire-Inférieure. No one was more ardent in bringing about the death of Louis XVI. than Fouché, who took a leading part in the inauguration of the Worship of Reason, and in the spoliation of the churches which took place in 1793-94—a measure which replenished the coffers of the Republic. In October, 1793, he was sent with Collot d'Herbois as commissioner to Lyons, and showed himself a monster of cruelty, boasting publicly of the number of victims he had caused to be put to death. Excluded from the Jacobin Club by Robespierre, after he had held the presidency, Fouché was in danger of losing his life, and was even arrested, but was released by the amnesty of October 26, 1795. He ingratiated himself with Barras by betraying Babœuf and his friends to the Directory, and was sent as Minister Plenipotentiary to Milan. There he plotted against the Cisalpine Republic and was expelled, but immediately was sent as Ambassador to Holland. A few months later he was recalled and made Minister of Police, July, 1799. In this capacity he showed great vigor; he suppressed the newly organized Jacobin Club, and a large number of newspapers, and created an extensive system of espionage. He was won over to the Bonapartist cause, however, participated in the coup d'état of the 18th Brumaire, and became Minister of Police under the Consulate. In the new Government, strangely enough, he became the champion

of moderation; by his advice the list of émigrés was closed, a general amnesty was proclaimed, and a policy of conciliation steadily pursued. He was forced to resign his office in 1802, though raised to the Senate with a large pension, but he still kept up a police system of his own, and in 1804 was reappointed to his former place on account of the many plots against the life and power of Napoleon. It was at this time that he made his famous remark on the execution of the Duc d'Enghien: "It is worse than a crime; it is a blunder."

Under the Empire Fouché was Minister of the Interior as well as head of the police, and controlled the internal government of France during the frequent and prolonged absences of the Emperor. In 1809, on the occasion of the landing of English forces at Walcheren, he issued a proclamation calling on France to show that she could repel the invader without the presence of the Emperor. The proclamation had the desired effect, but it so incensed Napoleon that Fouché was deprived of the portfolio of the Interior, and shortly afterwards another mistake in diplomacy cost him his office as Minister of Police (1810). Disobeying the commands of the Emperor to take charge of the Government of Rome, and to deliver up secret papers which were in his possession, Fouché fell into further disgrace, and fled from France. Later he was allowed to return and reside on his estate at Pont Carré. In 1813 he was sent as governor to the Illyrian Provinces, but after the battle of Leipzig was recalled, and sent to Naples to watch Murat. Fouché, however, had been in secret negotiations with the Bourbons for some time, and did little to prevent Murat's defection. In 1814, on returning to Paris, he was welcomed by Louis XVIII. and offered the police portfolio, but declined. He foresaw the return of Napoleon from Elba, and during the Hundred Days resumed his police functions, though at heart a traitor to the cause he espoused. After Waterloo he went over to the Bourbons and aided in the pacification of the country as Minister of Police, but the law against the regicides in 1816 exiled him from France. He retired to Prague, became an Austrian subject in 1818, and spent his last years at Trieste, where he died, December 25, 1820. There is no good single work on Fouché. His *Mémoires* (4 vols., Paris, 1822-24; English translation, 1828-29), while based on genuine documents, have been declared a forgery by his family. For various aspects of his career consult: Martel, *Types révolutionnaires: Étude sur Fouché* (Paris, 1879); Desmarest, *Témoignages historiques, ou quinze ans de haute police sous Napoléon* (Paris, 1833); Lord Brougham, *Historical Sketches*, vol. iii. (London, 1858).

FOUCHER, fō'shā', JEAN (1508-67). An explorer and colonizer in South America. He was born at Cambrai, Flanders, became a sailor, and accompanied Sebastian Cabot on the voyage to South America which resulted in the discovery of the Paraguay River. He remained at the mouth of the Plata until 1529, and after a few years in Europe, joined the Spanish expedition of Mendoza to Paraguay, in 1534, as pilot. After the founding of Buenos Ayres, he led an exploring party inland, and after an adventurous journey in which he reached as far as the base of the Cordilleras in Peru, he returned to the eastern coast in 1539. He became one

of the advisers of Cabeza de Vaca, the Governor, whom he induced to adopt a friendly policy toward the natives, and with whom, in 1544, he was imprisoned and sent back to Spain. In the following year he was pardoned, and returned to South America, where, as Governor of Entre Rios, he continued his explorations, and did much to establish friendly relations between the colonists and Indians.

FOUCHER DE CAREIL, fō'shā' de kā'rā'y', LOUIS ALEXANDRE, Count de (1826-91). A French diplomat and author, born in Paris. In 1872, he became Prefect of the Department of Seine-et-Marne, in 1876 a member of the Senate, and in 1883 Ambassador at the Court of Vienna. The last-named post he resigned in 1886. He was a recognized authority on the philosophy of Leibnitz. He wrote a series of expository volumes on the subject, including: *Réfutation inédite de Spinoza par Leibniz* (1854); *Leibniz, la philosophie juive et la Cabale* (1861); and *Leibniz, Descartes et Spinoza* (1863). His chief literary work was connected with his edition of the *Œuvres de Leibniz* (1859 et seq.; 2d ed. 1867 et seq.; to include, as projected, 20 vols., of which 7 appeared).

FOUGÈRES, fō'szhā'. The capital of an arrondissement in the Department of Ille-et-Vilaine, France, picturesquely situated on a hill on the Nançon River, 28 miles northeast of Rennes (Map: France, E 3). It is a handsome, well-built town, with wide streets, and in the old quarter retains mediæval traces in the ancient houses with arcades which overhang the sidewalks. There are also some remains of its ancient walls. The castle of Fougères, a picturesque object, was at one time considered the key to Brittany. The churches of Saint Sulpice and of Saint Leonard have many interesting features; a college and three hospitals are among the principal public buildings. In the neighborhood is a great forest containing prehistoric megalithic remains. Population, in 1901, 20,952. Fougères is celebrated for the engagement which took place in the vicinity between the Vendean Royalists and the Republicans, November 15, 1793.

FOUILLÉE, fō'yā', ALFRED JULES EMILE (1838-). A French philosopher, born in La Pouëze, Maine-et-Loire. He began his career as a teacher in the colleges of Louhans and Auxerre, and the lycée of Carcassonne, and was afterwards professor of philosophy at Douai and Montpellier. For three years (1872-75) he held an important position in the normal school at Bordeaux, but was forced by ill health to retire, and devoted himself to the production of treatises upon the philosophies of Plato and Socrates, a *Histoire de la philosophie* (1875, 6th ed. 1892); *L'idée moderne du droit en Allemagne, en Angleterre et en France* (2d ed. 1883); *La science sociale contemporaine* (2d ed. 1885); *Critique des systèmes de morale contemporaine* (2d ed. 1887); *L'enseignement au point de vue national* (1891); *La psychologie des idées-forces*, and other philosophical works, besides contributing articles to the *Revue des Deux Mondes* and the *Revue Philosophique*. His substance is speculative and his style graceful.

FOUL BROOD. A virulent contagious disease of bees due to the action of a pathogenic organism, *Bacillus alvei*. The disease, which

has been known since the time of Aristotle and occurs wherever bee-keeping is practiced, affects chiefly the young bees, and especially weak and badly nourished colonies. When attacked by foul brood the larvæ become extended, lose their plumpness, turn yellow and later brown. Dead larvæ emit a disagreeable odor. When the larvæ die after the cells have been capped, the caps become brownish and sunken; perforations may later be developed. As a rule, the bees show a disinclination to work, remain fanning at the entrance to the hive, and do not remove the dead larvæ. The adults may also become infected. The disease varies in its virulence, and is at times much more fatal than at others. Perhaps the robbing of diseased hives by healthy bees is the chief method by which the disease is spread; but infection may result from the visiting of flowers which have previously been visited by diseased bees. Wax and other bee-keeping supplies may spread the disease. The bacillus of foul brood grows in the presence or the absence of oxygen. The spores may be destroyed by long exposure to direct sunlight or for a period of $2\frac{3}{4}$ hours to a temperature of 100° C. The disease may be eradicated by destroying infected bees, combs, frames, and hives; removing the bees, allowing them to fast for a few days, and then placing them on new comb; or by chemical treatment, such as feeding certain antiseptics in syrup, or in using them to fumigate infected hives and supplies. Formalin has given best results, but carbolic acid, salicylic acid, camphor, thymol, creolin, eucalyptol, and naphthol have been successfully employed. For literature, consult publications referred to under BEE-KEEPING, and Harrison, "The Foul Brood of Bees," in *Centralblatt für Bakteriologie Parasitenkunde und Infektionskrankheiten*, vol. vi., 1900, Nos. 13 to 16 (Jena, 1900).

FOULD, fôld, ACHILLE (1800-67). A French financier and statesman. He was born in Paris, November 17, 1800, of Jewish parents, and was educated at the Lycée Charlemagne. Fould came naturally by his financial gifts, his father being a wealthy banker of Paris. In 1842 he began his political career as a member of the Council-General of the Department of Hautes-Pyrénées, and was immediately after elected a Deputy for Tarbes, the chief town of that Department. In the Chamber of Deputies he acquired a high reputation for the ability with which he handled questions of finance, and in 1844 was appointed reporter to the commission on stamps on newspapers. At that time he was a staunch supporter of Guizot. After the Revolution of 1848, however, he accepted the new régime, and offered his services to the Provisional Government. In July, 1848, he was elected to the Constituent Assembly for the Department of the Seine, and rendered valuable services to the Government, in particular by advising against the issue of assignats. During the Presidency of Louis Napoleon he was four times Minister of Finance, and his repeated resignations for State reasons did not prevent him from being again appointed on the occasion of the coup d'état, December 2, 1851. He once more resigned his position in January, 1852, in consequence of the decree ordering the confiscation of the property of the Orleans family. The same day, however, he was created a Senator, and shortly afterwards returned to power as

Minister of State. In this capacity he superintended the Paris Exposition of 1855 and the completion of the Palace of the Louvre. He remained one of the confidential ministers of Napoleon III. till December, 1860, when he was succeeded as Minister of State by Count Walewski. In November, 1861, he was re-appointed Minister of Finance and held office until January, 1867. He died October 5th of the same year, at Tarbes. His three sons were all prominent in French politics.

FOUL IN THE FOOT. A contagious disease in the feet of sheep, characterized by ulcers and granulations. It is generally controlled and cured by applications of tarry substances. The name has been applied also to tubercular foot-rot, tubercular disease of the bones, and canker.

FOULIS, fow'lis, ROBERT (1707-76) and ANDREW (1712-75). Two eminent printers of Glasgow, brothers, whose names are usually classed together. Robert, the elder, for some time practiced as a barber—in those days a profitable and respectable profession. Having by his abilities attracted the notice of the celebrated Dr. Francis Hutcheson, then professor of moral philosophy in Glasgow University, he was advised by him to establish a printing-press. Accordingly he spent 1738 and 1739 in England and France with his brother Andrew, who apparently had been designed for the Church, and so had enjoyed a better education. In 1741 he started in business as a printer, his first publications being chiefly of a religious nature, and in 1743 was appointed printer to the university. In this year he published an elegant edition in octavo of *Demetrius Phalereus on Elocution*, supposed to be the first Greek work printed in Glasgow. In 1744 he brought out his celebrated immaculate edition of Horace, small 8vo, each printed sheet of which was hung up in the college at Glasgow, and a reward offered for the discovery of any inaccuracy. But, in spite of all efforts, six errors remained. Soon after he took his brother Andrew into partnership; and for thirty years they continued to bring out, particularly in the Latin and Greek classics, some of the finest specimens of correct and elegant printing which the eighteenth century produced, either in Great Britain or on the Continent. Among them were Cicero's *Works*, in 20 volumes; Caesar's *Commentaries*, folio; Homer, 4 vols.; Æschylus; Herodotus, 9 vols., etc.; also an edition of the Greek Testament; Vergil; Gray's *Poems*; Pope's *Works*; a folio edition of Milton, and other publications in English. In all over five hundred and fifty publications came from their press. With the view of promoting the cultivation of the fine arts in Scotland, Robert Foulis, after a two years' visit to the Continent in preparation, commenced, in 1753, an academy at Glasgow for the instruction of youth in painting and sculpture. The expense attending this institution proved too great, and the printing business declined, but continued to be carried on till the death of Andrew, September 18, 1775. In 1776 Robert exhibited and sold at Christie's, Pall Mall, London, the remainder of his paintings, in the hope of recouping his broken fortunes; but after all expenses were defrayed the balance in his favor amounted to only 15 shillings. He died the same year at Edinburgh, on his return to Scotland.

For a catalogue of the publications of the Foulis brothers, consult: Duncan, *Notices and Documents Illustrative of the Literary History of Glasgow* (1831); also Tedder in *Dictionary of National Biography*, vol. xx. (London, 1889).

FOULK, GEORGE C. (?-1894). An American naval officer and diplomat. He was born in Pennsylvania in the early sixties and entered the United States Naval Academy at Annapolis at fourteen, graduated four years later at the head of his class, and as ensign served in the United States Navy on the Asiatic Station. In addition to the ordinary routine of his profession, he mastered the Japanese language and subsequently the Korean. He was detached in 1883, to serve as interpreter and secretary to the Korean Embassy, the first ever sent to Western countries. Arriving in Seoul in June, 1884, he was made naval attaché to the United States Legation and at Government instance made a journey through the country, publishing in the *United States Foreign Relations* his report. He enjoyed the confidence of the King and the progressive men, and on their behalf brought out military instructors and school-teachers from the United States, and aided in the formation of a stock farm and breeding station. Though foreseeing the political storm which broke December 4, 1884, he made a journey in the southern provinces, and after many dangers and hair-breadth escapes, he reached Seoul, acting as chargé d'affaires *ad interim* for 18 months, the youngest man ever intrusted with the duties of a Minister from the United States to a foreign country. Re-entering the service of the Navy, he later resigned, married a Japanese lady, and became professor of mathematics in the Doshisha University in Kyoto, where he died in 1894.

FOULKE, WILLIAM DUDLEY (1848—). An American lawyer, civil-service reformer, and author, born in New York City. He graduated at Columbia in 1869, at the law-school of the university in 1871, was admitted to the bar in 1870, and practiced at New York City until 1876. Having removed to Richmond, Ind., he was there for fifteen years an attorney of the Pittsburg, Cincinnati, and St. Louis railway, and for one year (1883) an editor of the *Palladium* newspaper. About 1890 he retired from the bar. He was a member of the Indiana State Senate from 1882 to 1886; in 1885 introduced a bill to establish civil-service reform in Indiana, and subsequently organized and became president of the Indiana Civil-Service Reform Association. His investigations into the management of the State Hospital for the Insane revealed grave mal-administration, due principally to the 'spoils' system. In the interest of the National Civil-Service Reform League, as chairman of a special commission, he also conducted in 1889-90 a series of investigations into the condition of the Federal civil-service. His publications include: *Slav or Saxon. A Study of the Growth and Tendencies of Russian Civilization* (*Questions of the Day*, No. 43, 1887); *Civil-Service Reform, Its Later Aspects* (*Economic Tracts*, No. 31, 1890); *The Present State of Our Civil Service* (printed with Warner's *The Silver Question*, in the *Publications of the American Social Science Association*, 1891); *The Theory and the Practice of Civil-Service Reform* (in the *Proceedings of the annual meeting of the National Civil-Service*

Reform League for 1894); *Proportional Representation, An Address Before the Municipal League of Boston* (*Publications of the League*, No. 4, 1896); a biography (1898) of Oliver P. Morton, war governor of Indiana; and *Maya, a Story of Yucatan* (1900).

FOULLON, fōŭ'lon' (often wrongly spelled FOULON), JOSEPH FRANÇOIS (1717-89). A French administrator, and one of the earliest victims of the French Revolution, born at Saurmur. He served as Intendant-General of the French Army during the Seven Years' War, and became in 1771 Intendant-General of Finance. Possessor of great wealth through marriage with the daughter of a rich Dutch family, he came to be in the popular mind the personification of all that was detestable, avaricious and hard-hearted, although he seems to have been really generous and sympathetic, and to have spent thousands of francs a year in giving employment to laborers on his estates at Viry. He was, however, active in furthering the measures for the defense of the Crown at the outbreak of the Revolution, and on July 12, 1789, was appointed Minister of Finance to succeed Necker. His task was not only thankless, but impossible of success. Threatened by the populace, he fled to his estates, but was overtaken and brought back to Paris. He was dragged through the streets with a bunch of hay stuffed in his mouth and a garland of thistles about his neck, and finally, in spite of the pleas of Lafayette, was hung to a lamp-post. Consult Chassin, *Les élections et les cahiers de Paris en 1789* (Paris, 1889).

FOUL PLAY. A romance by Charles Reade and Dion Bouicault, published in London, 1869. It was adapted for the stage and produced as a drama in six acts at the Holborn, in 1868, and in five acts at the Olympic, under the title of *The Scuttled Ship*, in 1877. The scene is laid partly in Australia and partly on an island in the Pacific.

FOUL WEATHER, CAPE. See CAPE FOUL WEATHER.

FOUL-WEATHER JACK. A nickname given to the English Admiral John Byron (1723-1786), on account of his ill luck at sea, whether sailing or fighting. He was wrecked in the *Wager* (1740), and afterwards made a hazardous voyage around the world.

FOUNDATION (from Fr. *fondation*, Lat. *fundatio*, from *fundare*, to found, from *fundus*, bottom). The term foundation is employed to designate either the lower courses of a masonry structure or the prepared surface upon which this structure rests. In this article the prepared surface will be called the foundation bed, and the artificial structure above it will be called foundation structure, although there are many cases in practice in which this distinction cannot be adhered to strictly. The importance of foundation work in architecture and engineering hardly needs proof, for it is evident that upon the permanency and strength of its foundation depends the structural integrity of every building, bridge, or other structure. Probably no branch of engineering construction calls for more technical ability and practical skill than foundation work.

FOUNDATION SOILS. The preparation of the

foundation bed and the load which it will sustain depend upon the nature of the foundation soil and its condition, particularly in respect to contained water. Foundation soils vary from hard bed-rock to almost liquid mud and silt. Solid rock is ordinarily the most perfect material upon which to build a foundation structure; but solid rock which disintegrates upon exposure to air or water may be a very unsatisfactory foundation soil. Generally speaking, however, bed-rock will carry safely almost any load which is likely to be placed upon it in ordinary work. Next to solid rock, sand and gravel form perhaps the best foundation soils, if they are so confined that they cannot spread laterally. Compact sand or clean gravel, in thick beds and confined from lateral movement, will sustain a load of from eight to ten tons per square foot. Clay soils vary from hard compact shales, which will carry almost any load, to soft, damp clay, which will squeeze out in every direction when heavily loaded. The stiffer varieties of clay, when dry, will carry a load of from four to six tons per square foot, but if wet will support scarcely half this load. Such soil as mud, silt, and quicksand have practically no sustaining power, and must be penetrated or removed until firm material is reached, or compacted by drainage or other means.

HARD-SOIL FOUNDATIONS. The construction of foundations on or in hard, stable sand, gravel, or clay soil is a comparatively simple task where they are above water-level. In rock the foundation bed is prepared by removing the loose stones and disintegrated rock, and roughly leveling off the surface. When crevices occur in the rock, they are filled with concrete, or if very wide are arched over, and if the natural surface is very much inclined, it is cut into steps like a staircase, instead of being leveled off at the elevation of the lowest point of the foundation area. The foundation structure is begun with a bed of concrete over the rock surface, and continued like masonry-work elsewhere. In hard soils the excavation is carried well below the frost-line, and its bottom is leveled off to receive the broad footing course of the masonry foundation structure.

COMPRESSIBLE-SOIL FOUNDATIONS. Foundation construction in compressible soils comprises first the artificial constructions necessary to reinforce the bearing power of the material, and second the building of the foundation structure. The supporting strength of the soil is reinforced in a variety of ways, but they can nearly all be classed under either pile foundations or platform foundations.

PILE FOUNDATION. In its essentials a pile foundation consists of a group of piles sunk into the ground and carrying on their tops a platform of timber or concrete. Piles are either of timber or of iron. Iron piles are usually either screw piles or disk piles. A screw pile consists of a shaft, usually of iron, but sometimes of wood, having at its foot an iron casting provided with one or two turns of a screw, the blades of which vary from 1½ feet to 5 feet in diameter. In disk piles the screw blades are replaced by a circular iron disk. Timber piles are round tree-trunks with the bark removed and the knots and roughness dressed off. The method of sinking piles varies with their form. Iron screw piles are driven by screwing them into the foundation

soil; timber piles are driven by means of hammers or the water-jet, and disk piles are driven by the water-jet. (See the article on PILE.) The supporting power of piles is due either to their acting as a column whose lower end rests upon a hard structure, or to the friction of the earth upon the side of the pile, or to a combination of both of these actions. Various mathematical methods are employed for calculating this supporting power, which varies with the character of the soil and the depth of the pile. At best the supporting power of piles can only be approximated, and it is customary to load them only to a fraction of their supporting power in order to avoid chances of failure. The number of piles to be used in any particular foundation will depend upon the weight to be supported and other load conditions, but it is seldom practicable to drive them closer together than 2½ feet to 3 feet apart. After being driven, the tops of the various piles are cut off to a common level, and they are ready for the construction of the platform or capping. If a timber platform is used, it usually consists of one or more courses of timber fastened to the tops of the piles and planked or floored over. If concrete is employed, the earth is leveled off a few inches below the tops of the piles, and the spaces filled with a layer of concrete which is carried up thick enough to cover the tops of the piles several inches. The foundation structure is built on the top of the platform.

PLATFORM FOUNDATIONS. The principle of the platform foundation is that of distributing a concentrated load over a large area by means of a platform or raft-like structure. Platform foundations are built of masonry, of masonry

FIG. 1. COLUMN FOUNDATION OF STEEL RAILS AND I-BEAMS IMBEDDED IN CONCRETE.

and metal combined, and of timber. A stone or brick masonry platform foundation consists of a series of inverted arches sprung between the supporting piers or columns. Concrete masonry platform foundations consist of a layer of concrete, of sufficient thickness not to break by bending, deposited over the foundation area. Timber platform foundations consist of two or more layers of timbers spiked together and covering the foundation area. Concrete and steel platforms consist of one or more layers of steel I-beams, railway rails, etc., imbedded in a layer of concrete. Platform foundations are extensively employed for founding buildings on soft ground.

SUBAQUEOUS FOUNDATIONS. Specifically, subaqueous foundations are those constructed on or beneath the bed of a stream or other body of water. Broadly speaking, however, subaqueous foundation processes must generally be employed in all places where the conditions necessitate that the foundation bed shall be below the water-level. The principal subaqueous foundation processes are: (1) the cofferdam process; (2) the crib and open caisson process; (3) dredging through wells; (4) the pneumatic caisson process; and (5) the freezing process.

COFFERDAM PROCESS. A cofferdam (q.v.) is an inclosure from which the water is pumped out, and in which the masonry is laid in the open air. The construction of cofferdams varies considerably. In still, shallow water a bank of earth surrounding the foundation area is often

like the timber platform for a pile foundation. The sides of the box or open caisson are also constructed of timber so arranged that they are water-tight. When the caisson has been grounded and the masonry completed, the sides of the caisson are removed.

The bottom of the caisson which remains in the foundation structure is usually called the crib. Often where crib and open-caisson foundations are sunk onto solid rock beds with an irregular surface, this surface is carefully determined by soundings, and the bottom of the crib is so fashioned that it fits these irregularities.

DREDGING THROUGH WELLS. Foundations constructed by dredging through wells usually consist of timber cribs or metal cylinders sunk by dredging through interior wells or the inside of the cylinder, and thus undermining the foundation, which may be sunk to very great depths.

PNEUMATIC CAISSONS. Described without technicalities, a pneumatic caisson is a water-tight box of timber or metal sunk bottom up or with its open side down. On top of the upturned bottom is built another box open at the top in which the masonry is built. The method of sinking is as follows: The lower box, or the caisson, is towed into position over the foundation site, and masonry is built inside the upper box until the edges of the lower box penetrate into the stream-bed. Air under pressure is then forced into the lower box, expelling the water underneath it, and men can then work underneath as in a diving-bell. (See DIVING.) These men excavate the earth, which is taken out through the top of the caisson, the caisson sinking deeper and deeper as the excavation proceeds until solid rock or other suitable hard material for a foundation bed is encountered. Concrete is then lowered into the caisson and

FIG. 2. PILE AND CRIB FOUNDATION FOR A BRIDGE PIER.

employed, or a similar wall of bags of clay, barrels of sand banked on the outside, etc. More generally, however, a double row of sheet piles with the space filled between with rammed clay and earth is built around the foundation area. Cofferdams are limited to works in comparatively shallow water, and where no very great depth of excavation is necessary to reach a good foundation bed. They are particularly adapted to foundations in water-bearing soils on land.

CRIB AND OPEN CAISSON PROCESS. This process consists in building the masonry in a box-like structure open at the top, which sinks as the masonry is added until it rests on the foundation bed. The foundation bed may be prepared

by dredging the bottom until solid material is found, or by driving piles which are cut off at a common level below water. As usually constructed, the bottom of the open caisson consists of one or more courses of timber bolted together,

FIG. 3. PNEUMATIC CAISSON FOR FOUNDATION OF A BRIDGE PIER.

the entire space filled with it. The upper box is then removed, leaving the masonry carried on the caisson filled with concrete. This is one of the most valuable methods of subaqueous foundation construction.

by dredging the bottom until solid material is found, or by driving piles which are cut off at a common level below water. As usually constructed, the bottom of the open caisson consists of one or more courses of timber bolted together,

FREEZING PROCESS. This process of foundation construction has been used in comparatively few instances, and always in sinking through water-bearing soil. Its operation is as follows: A row of tubes surrounding the site is sunk into the water-bearing material, and a freezing-liquid is forced into them until the surrounding material is frozen. The frozen material is then excavated and the masonry is built, after which the tubes are removed, and the ground is allowed to thaw out.

NOTABLE EXAMPLES OF FOUNDATION WORK. In the preceding paragraphs the various methods of constructing foundations have been very briefly described. To illustrate the application of these methods in actual work, a few notable examples of foundation construction will be described.

NEW EAST RIVER BRIDGE. The four suspension cables for this structure are carried by steel towers resting on masonry pedestals founded on pneumatic caissons. Each tower has two groups of four legs each, and each group of legs is carried by a separate pedestal and caisson foundation. The caissons for the Brooklyn tower were built of timber, and were 63×79 feet each in plan. They were sunk $97\frac{1}{2}$ feet apart, centre to centre, and with their longer sides parallel. Each structure consisted of a caisson proper and a cofferdam surmounting it, the whole forming a rectangular box 63×79 feet, with a solid flooring placed $7\frac{1}{2}$ feet above the bottom edges. The space between the walls below this floor formed the compressed-air working chamber, and the space above it to the top of the caisson was filled with timber cribwork, with suitable wells left for exit from and entrance to the working chamber. The caisson for the south pier or pedestal was sunk to the greatest depth, about $107\frac{1}{2}$ feet below water-level, which, with one exception, is the greatest depth to which a pneumatic caisson foundation has ever been sunk. After sinking, the entire working chamber and all the open spaces in the caisson proper were filled with concrete. The stone masonry of the pier began on top of the caisson. As indicating the quantities of material and amount of work required in this tower foundation, the following figures are significant:

QUANTITIES	South caisson	North caisson
Timber, cub. ft.....	58,800	74,700
Iron, tons.....	86	98
Concrete, yds.....	5,140	7,245
Stone masonry, cub. yds...	7,755	7,755
Sand excavation, yds.....	3,400	4,000
Clay, yds.....	2,233	4,170
Rock, yds.....	390	940

The following figures give the principal dimensions and other significant general dates of a few other important pneumatic caisson bridge foundations:

NAME OF STRUCTURE	Lateral dimensions, feet	Material	Area, sq. ft.
Third East River Bridge.....	78 X 144	Timber	11,232
Alexander III. Bridge, Paris.....	144 X 110	Steel	15,860
New York and Brooklyn Bridge.....	168 X 102	Timber	17,136
Hayne de Grace, Maryland.....	78.2 X 42.3	"	3,307
Eads Bridge, Saint Louis, Mo.*.	64 X 48	"	3,072
Forth Bridge, Scotland*.....	70	Iron	3,848

*This caisson was sunk to a depth of 109 feet $8\frac{1}{2}$ inches below water. *Four cylindrical caissons of this diameter were employed for each of the two main piers.

HAWKESBURY BRIDGE. The bridge over the Hawkesbury River in Australia was founded by dredging through metal cylinders. The cylinders, or rather ellipses, were 48×20 feet in diameter, and the dredging was done through three tubes which terminated at their bottoms in bell-mouthed extensions which met the cutting edge of the elliptical shell. The space between the dredging-tubes and the outer shell was filled with gravel as the sinking progressed. The material penetrated was mud and sand and the foundation bed of hard gravel was reached at a depth of 185 feet below high water. The shell was filled to low water with concrete and above with cut stone masonry.

POUGHKEEPSIE BRIDGE. The bridge across the Hudson River at Poughkeepsie, N. Y., was founded by first sinking timber cribs, by dredging through interior walls, and then sinking an open caisson on top of the crib. The largest crib sunk was 100 feet long, 60 feet wide at the bottom, 40 feet wide at the top, and 104 feet high. It was divided by one longitudinal and six transverse walls into 14 compartments. The outer walls and the longitudinal interior wall were made wedge-shaped and solid for a height of 20 feet and above that they were hollow. The gravel used to sink the crib was deposited in these hollow walls. The dredging was done through the 14 interior compartments, and when hard bottom was reached at a depth of 134 feet the pockets were filled with concrete.

KINGSBRIDGE POWER-HOUSE. In constructing the power-house for the Third Avenue Railway in New York City, a pile foundation with a concrete platform was constructed having lateral dimensions of $250\frac{1}{2} \times 319\frac{1}{2}$ feet. At the site of the foundation a bed of fine sand overlaid solid rock at a depth of over 100 feet. A cofferdam of sheet piling was constructed entirely around the foundation. The bearing piles were driven 2 feet and 4 inches apart under the boiler-house and 2 feet 6 inches apart under the engine-house. This spacing refers to the piles inside the first row around the entire building. The piles in this first row were driven close together and with a slight slant outward and downward. This arrangement was adopted to aid the sheet piling in confining the sand. The inner bearing piles were all driven vertically by the water-jet. The tops of the piles were cut off at a uniform level of 6 inches above the bottom of the excavation, and were capped with a layer of concrete $7\frac{1}{2}$ feet thick or 7 feet thick above the tops of the piles. This concrete cap was a solid monolithic structure.

AUDITORIUM HOTEL. The Auditorium Hotel in Chicago rests on a platform foundation consisting of a timber platform 2 feet thick covered with a layer of concrete 5 feet thick; in the concrete are imbedded three layers of railway rails, a layer of V-beams, and a layer of I-beams. The area of the foundation is 60,000 square feet.

TALL BUILDINGS. The Fair Building in Chicago is notable as presenting one of the most typical examples of the steel and concrete floating foundation so extensively used in that city and elsewhere. The framework of the building is carried by 46 columns. The foundations of these columns consist in each case of, first 18 inches of concrete on top of which are laid, cob-house fashion, three layers of railway rails, the interstices be-

tween which are filled with concrete. Each succeeding layer of rails has smaller lateral dimensions than the preceding layer, so that the structure is pyramidal in form. On top of the third layer of rails is placed a layer of rolled I-beams, filled between and outside with concrete, and on these I-beams rests a cast-iron pedestal. The total depth of the foundation structure exclusive of the pedestal is about 4 feet. Some of these foundations carry a single column and some carry two columns, and their lateral dimensions vary with the number of columns carried and with the loads on the columns. Nearly all of the tall buildings of Chicago have foundations of this general construction. The Broad Exchange Building in New York City is founded on pneumatic caissons sunk to hardpan. The framework of the building is carried by 100 columns and the foundations were designed upon the general plan that each column should have its individual caisson foundation. All the caissons except those located along some of the party walls are cylindrical and carry the columns concentric with their tops. The party wall caissons are rectangular, with their longer sides parallel to the wall. The cylindrical caissons vary from 7 feet to 9½ feet in diameter, the greater number being of the smaller size. They are filled with concrete to the top and most of them have a granite coping the full size of the caisson. All the caissons were made of steel plate and were sunk by the pneumatic process.

The preceding paragraphs give only a bare outline of foundation construction, the great variety of methods and conditions of such work making a full treatment possible only in special treatises. Among the best books on foundation construction, consult: Patton, *A Practical Treatise on Foundations* (New York, 1893); Baker, *A Treatise on Masonry Construction* (New York, 1900); Fowler, *The Cofferdam Process for Piers* (New York, 1898). Many of the best descriptions of foundation work are found in the engineering journals and the publications of the various engineering societies.

FOUNDER (from ME. *foundren*, to founder, from OF. *fondren*, to sink, from *fond*, Lat. *fundus*, bottom), or LAMINITIS. Inflammation of the vascular sensitive laminae of the horse's foot. It is rarely met with in cattle or sheep, owing to the corresponding structures being in them much less developed. Occasionally the laminae are strained from severe exertion; more frequently they suffer from the morbid effects of cold, which is especially injurious after the excitement and exhaustion of labor. Very commonly also they become inflamed from their close sympathy with diseases of the digestive organs, often following engorgement of the stomach, or inflammation of the bowels. All four feet are sometimes affected, more usually the fore pair only. The feet are hot and tender; the animal stands as much as possible upon the heels; trembles and groans when moved; and is in a state of acute fever and pain. Except when following superpurgation or internal disease bleeding is useful. The shoes must at once be removed, and the toes, if long, reduced, but no further rasping or cutting is permissible. The affected feet should be kept in a tub of water at a temperature of 45° F., or wrapped in cloths wet with cold water. Soap-and-water clysters, repeated if necessary every hour, usually

VOL. VIII. — 8.

suffice to open the bowels, which are very irritable. Physic, if required, must be used with extreme caution. Two drams of aloes is an ample dose in cases of founder. The strain should be taken off the inflamed laminae by getting the animal, if possible, to lie down, or, where this is impracticable, by suspending or supporting him in slings. When the inflammation continues so long that serum and lymph are poured out between the sensitive and horny laminae, free exit for the same must be provided by making an opening through the toe with a small drawing-knife. This may prevent the pumiced and disfigured feet that are apt to follow severe and repeated attacks. After the acute symptoms pass, cold applications to the feet and a mild blister round the coronet help to restore the parts to their natural condition.

FOUNDER OF PEACE. A title given to Saint Benedict.

FOUNDERS AND PATRIOTS OF AMERICA, ORDER OF. An hereditary patriotic society organized in New York City in 1896. The objects of the Order are the association of those whose ancestors struggled together when the United States was a new country; the teaching of a reverent regard for the character of the founders of the country; and the preservation of records relating to the first colonists, their ancestors and descendants. The society admits to membership lineal descendants of an ancestor who settled in any of the colonies prior to May 13, 1657, and whose subsequent ancestors were loyal to the cause of independence. The National Society consists of representatives of the State societies in New York, Pennsylvania, Connecticut, New Jersey, and Massachusetts, and holds its annual meetings on the anniversary of the settlement of Jamestown. The membership is upward of 450.

FOUNDING, or METAL-CASTING. The art of forming in loam or sand a mold of any given design which is subsequently filled with molten metal and allowed to solidify. The resultant casting is a copy in metal of the design or model furnished. The place in which these operations are performed is called a foundry. Foundries are distinguished by either the metals employed or the class of castings made, as iron, steel, brass, statue, type, bell foundries, etc. The variations of working in founding are so numerous that it is possible here to describe even briefly only the general process of iron-founding and a few more important special processes for producing certain kinds of castings.

IRON-FOUNDING may be divided into three operations: (1) The making of the mold; (2) the melting of the metal; and (3) the pouring of the molten metal into the mold. The making of the design or mold, which is usually called the pattern, is not strictly a part of founding, although in most instances foundries have pattern-shops working in conjunction with them as a part of the same plant. Wood patterns are by far the most numerous, although other materials are also used. The molding is usually done in sand or in loam; the great bulk of commercial iron castings being produced in sand molds. Every mold must consist of at least two parts in order that the pattern may be removed. When the desired casting is of complicated form the pattern is usually made in several pieces so joined that

they may be removed one at a time. The process of molding in sand, using flasks, is, briefly stated, as follows: The lower flask, called the drag or swivel, is filled with sand and the lower half of

FIG. 1. SECTION OF FOUNDRY FLASK AND MOLD.

the pattern imbedded in it. The upper flask is then placed in position on the lower, and sand is rammed tightly around the upper half of the pattern. The pair of flasks is then turned bottom up and the sand, first loosely placed in the drag, is removed and replaced by firmly packed fresh sand. The pair of flasks is then reversed to their original position, and they are parted along the line of juncture, the pattern remaining in the drag and the mold of its upper part, remaining in the upper flask or cope. After removing the pattern from the drag and finishing up the imperfections in the mold by hand the two flasks are again placed in position and the metal is poured through suitably formed holes or gates. The mode of procedure just described is greatly varied in detail, but its essentials remain the same. For example, the bottom flask is often dispensed with, the lower half of the mold being formed or 'bedded in' the sand floor of the foundry, while the upper half of the mold is formed in a flask or cope, as when a pair of flasks are

ished, are placed in a drying-oven and thoroughly dried. Molds in dry sand admit of exceedingly large and intricate castings being made with much less risk than in green sand.

Loam molding differs from sand molding in that the molds proper are not contained in flasks or bedded in the floor, but are constructed in sections composed of rings, plates, and brickwork. To illustrate loam molding the comparatively simple process of casting a cylinder will be described. A hollow core of iron or brick is first erected and plastered outside with a layer of loam—mixed sand and clay—to the exact inside dimensions of the cylinder. When the loam coating is dried it is washed with a mixture of charcoal and water. A layer of loam is then added, which is laid on and finished off to the exact thickness and exterior form of the cylinder to be cast. This is then dried and washed, as was the core. Around this thickening, as it is sometimes called, is built a shell of brickwork a few inches larger than the thickened core, and the annular space is rammed full of loam. When dried, this shell is lifted by a crane and the thickening removed from the core. The shell or cope is then replaced, and there is an annular space left between it and the core, exactly the dimensions and shape of the thickening. This space is the mold into which the molten metal is poured. This is almost exactly the process of bell-casting. See BELL.

The iron is melted in a cupola, or foundry furnace, which consists essentially of a short iron cylinder mounted on iron columns and lined with fire-brick, and of a belt or wind-box surrounding the cupola near the bottom, and from which several pipes or nozzles, called tuyeres, extend into the cupola to give entrance to the air-blast. Cupolas vary in diameter from two to ten feet. They are cylindrical for a portion of their height, and then conical, to form a chimney. At the top of the cylindrical portion is placed the charging-hole, and at the bottom are one or two breast-holes for raking out the cinders, and a tap-hole through which the molten metal is drawn. The molten metal is run into ladles, which are iron vessels lined with some refractory substance, and provided with a lip for directing the metal into the mold in pouring.

The preceding paragraphs describe very briefly the general process of making iron castings; the following are the special methods adopted in making certain forms of castings which are used in large quantities, such as car-wheels, cast-iron water-pipe, kettles, ordnance, and statuary. The casting of car-wheels varies from the general process described only in having an iron ring for that portion of the mold which forms the tread. This iron ring has the effect of suddenly cooling the metal forming the tread and thus rendering it more dense and hard. This hardening process is called chilling, and is employed in making rolls and other articles which require a hard wearing surface. Water-pipe is cast vertically in cast-iron casings having the core on a barrel. The pattern is inserted in the casing and the annular space between it and the casing is rammed full of sand. The pattern is then removed and the core inserted in its place. In casting kettles, the core corresponding to the inside of the kettle is molded bottom up on a bare plate. A thickening of sand of the exact thickness and exterior form of the

FIG. 2. SECTION OF MOLD ARRANGED FOR CASTING A STEAM ENGINE CYLINDER.

employed. Often also the pattern is parted at the middle, one part remaining in the drag and one in the cope to be separately removed. If the casting is to be hollow, a core of the proper form is suspended in the mold previous to restoring the cope to its position on the drag. These cores are commonly built up on iron coils and are coated with sand. Two varieties of sand-molding are employed: green-sand molding and dry-sand molding. The essential difference is that in dry-sand molding the flasks, after the mold is fin-

kettle is then added to the core. A cope is then built around the thickened core, and when dry is removed to allow the thickening to be broken away, after which it is replaced and the metal poured. All cast-iron hollow ware, pots, pans, etc., are cast in substantially the same manner.

Statue-founding is much similar, except that the thickening of the pattern in bronze-casting is made of wax, which is melted out by heat without lifting the cope. Small statuary casts of lead, tin, zinc, and their alloys are made by pouring the metal into iron molds and, after due time has been allowed for a skin to congeal on the surface, inverting the mold, and allowing the molten inside metal to run out. Iron statues are founded like kettles or bells, with a core thickening of sand or loam and with the cope made in sections to permit removal. Type is cast in metal molds at the ends of which is the matrix for forming the letter. In modern type-foundries the process is a mechanical one performed automatically by type-casting machines.

Cast ordnance is now seldom made, but the process of producing such castings calls for a brief explanation. Bronze and cast-iron cannon are cast in loam molds. The founding of a Rodman gun, which, while now obsolete, is the most recent form of cast gun (see *ORDNANCE*), is as follows: The mold is of dry sand contained in circular sectional casings. The chief feature is the core barrel, which consists of a water-tight cast pipe or barrel with flutes on its exterior surface along its whole length to permit the gas to escape upward from behind the hemp and loam with which the barrel is coated. After the mold has been closed together, the barrel is attached to a spider or tripod, the legs of which rest upon the top flange of the casing; adjusting screws at the end of each leg permit the accurate centring of the core in the mold. A pipe extends down the centre of the core, through which water is forced and escapes by rising through the annular space between the pipe and the inside of the core. The purpose of this process is to cool the gun-casting from the inside outward. In casting a 15-inch gun the water-pipe and core are removed in about twenty-four hours, and afterwards a current of cool air is forced into the bore of the gun, which is cool enough to remove from the mold in about nine or ten days.

These few examples of the many different methods of founding will give a very fair notion of the art. In closing, a word may be said about molding-machines. They are made in a great variety. One of the most important classes comprises machines for molding cast gear-wheels. For a full description of founding processes and tools, consult: Bolland, *The Iron Founder* (New York, 1892); id., *The Iron Founder Supplement*, and id., *Encyclopædia of Founding* (ib., 1893); West, *American Foundry Practice* (ib., 1882); id., *The Molders' Text Book* (ib., 1886); Dingey, *Machinery Pattern-Making* (ib., 1892); Sharp, *Modern Foundry Practice* (ib., 1900).

FOUNDLING, THE. A play by Edward Moore (1748). The plot is based on the false report of the death of the foundling, Harriet Raymond, who in reality, under the name of Fidelia, was sold to a villain, and finally rescued by Charles Belmont, who marries her.

FOUNDLING HOSPITAL or **ASYLUM.** An institution for the care of children, particularly

infants that have been abandoned by their parents or guardians. In modern times the great majority of children in foundling hospitals are not foundlings, but are (1) illegitimate children brought to the institution by the mothers or their friends; (2) legitimate children whose mothers, because of desertion of husband, poverty, or other causes, feel unable to care for them; and (3) a few orphans.

The first foundling hospitals were introduced by the Church to prevent infanticide. In the sixth century the Bishop of Treves permitted children to be placed in a marble basin before the cathedral, with the understanding that members of the church would care for them. The capitularies of the Frankish kings mention foundling hospitals. The first well-authenticated establishment was founded at Milan in A.D. 787, the Council of Nicæa in that year having ordered that each city should have an institution for abandoned children. A foundling hospital was organized at Montpellier in 1070; Einbeck, 1200; Rome, 1212; Florence, 1317; Nuremberg, 1331; Paris, 1362; Vienna, 1380. For the care of children above the age of infancy, see *DEPENDENT CHILDREN*.

The number of foundling hospitals in France was greatly increased through the labors of Saint Vincent de Paul and of Colbert in the seventeenth century. After 1789 the French Republic assumed the charge of foundlings. The children were at first publicly received, but by a decree of 1811 there was introduced into foundling hospitals throughout the Empire a revolving cradle-tour, so arranged that the person who deposited a child in the cradle could not be seen from within. The person was then able to turn the cradle so that the child would be brought within the institution. This was introduced on the ground that thereby child-murder would be lessened. Whether infanticide was materially decreased is not known, but the unexpected and immediate effect was a great increase in the number of children abandoned. The number left at foundling hospitals in 1784 is stated to have been 40,000; in 1815, 68,000; and in 1834, 134,000. Other countries had similar experiences. In 1834 a Parliamentary commission reported that the influence of the *tour* was pernicious; and it was gradually abolished. With the abolition of the *tour* a marked decline in the number of foundlings took place.

At present the public foundling hospital in France serves merely for the temporary care of the infants. Every attempt is made to discover the identity of the mother. If found, persuasion is employed to induce her to take back the child; if she is in need of support, public aid is promised her. When the mother cannot be found, or if she will not take the child back, a place is found for it in a private family, where it is nursed and cared for during the period of infancy. A similar system is in vogue in some of the German cities, notably Leipzig. This system has not only greatly diminished infant mortality, but has very materially diminished the number of children abandoned.

In Vienna foundlings are cared for in a hospital. Mothers who wish to leave children in the institution are required to serve in the hospital as nurses for a period of three months. The system provides for the nursing of children whose mothers are not found. Moreover, after caring

for her child for so long a period of time, the mother is less inclined to leave it if it is possible for her to keep it. The system has been found to yield very satisfactory results.

About 1741 the Foundling Hospital of London began to receive children. It was established by Thomas Coram, a benevolent sailor, who donated 56 acres of land, which now yield in annual rents more than the original purchase price of £5500. At first applications for admission were so numerous that the children admitted had to be chosen by lot. Fifteen years later Parliament gave financial assistance, and all the children deposited in a basket outside the gate were cared for. This system led to such serious abuses that the authorities decided to take charge of only those children who were accompanied by the sum of £100. In 1801 the present form of organization was adopted. A child is admitted only after a careful personal examination of the mother has shown that it is illegitimate and the first born, and that the mother has never lived with the father. Preference is given in cases where the mother has been deceived by a promise of marriage. The hospital is rich and well managed, and takes good care of its foundlings.

In America the county poor farm was the only place at first provided for foundlings. In some places there is still no other public provision. Foundling hospitals, however, are now to be found in all the larger cities. Nearly, if not all, the foundling hospitals are under private management, but many of them receive subsidies from public funds. 'Baby farms' is the name applied to those places where babies are boarded for the sake of the gain. They exist in most of our cities. They are not incorporated, are subject to no supervision or control, though they frequently solicit donations on the plea of charity. They are productive of frightful abuses and should be prohibited.

The death-rate in foundling hospitals frequently ranges from 90 per cent. to 100 per cent., and an average of 75 per cent. is common. The New York Infants' Hospital lost 98 per cent. of its foundlings in 1895, 99 per cent. in 1896, and 100 per cent. in 1897. "Twenty-eight infants were consigned one after another by a public official to a private institution and they all died." The experience of European institutions is identical. The better institutions now recognize this evil and seek to avoid it by having the mother who wishes to leave a child in the institution stay and nurse it and another child also if possible. In the Chicago Foundlings' Home, where this rule is practically enforced, the death-rate is very low. Where this plan is impracticable, the New York Foundling Asylum and others have adopted the plan of placing the infants at board in selected private families. Those receiving the children must comply with the detailed rules of the institution. Medical care is furnished, and a careful system of visitation is maintained. The children are later recalled to the institution, and are finally placed in homes.

Another objection to the present system is that the preliminary investigations are insufficient, so that many children are received who are not properly subjects for charity. Very few foundling hospitals make any further investigation than to question the one bringing the child.

In Massachusetts foundling hospitals have been abolished by law. It is forbidden to board

more than two infants under two years of age in any family unless that family has a license given after thorough investigation, the license stating the number of children allowed. The State Board of Charities has a department for the children, who are boarded out in families. Since the abolition of the foundling hospitals the death-rate has decreased 12 per cent. In 1898 the foundlings from the New York Infants' Hospital were boarded out. The death-rate of those boarded fell to 55.9 per cent. immediately, and later to 31.1 per cent.

FOUNDRY. See **FOUNDING**.

FOUNTAIN (OF. *funtaine*, *fontaine*, Fr. *fontaine*, from ML. *fontana*, from Lat. *fons*, spring; connected with Gk. *χεῖρ*, *chein*, Skt. *hu*, to pour, AS. *gēotan*, Icel. *gjota*, OHG. *gizzan*, Ger. *giessen*, to pour). A place where there is a continuous flow of fresh water into either a natural or an artificial basin. In southern and eastern countries, where water is of especial importance, not only has great care always been taken to insure its plentiful supply, but this importance has been recognized by beauty of architectural and sculptural decoration. In the ancient world another incentive was added—religious devotion to the water deities, to water nymphs, to gods of curative mineral sources. The earliest preserved example is a large stone basin carved in relief with figures, found in the royal palace at Tello. This Babylonian fountain dates from B.C. 3000. Next is the Assyrian fountain at Bavian, sculptured in the face of the rock itself, where two affronted lions rest their fore paws on the mouth of a vase from which the water spouts into a series of basins cut in the rock and descending to the stream, the lions being at the lowest basin. Ancient Greek fountains of any size were usually inclosed. There was no aquatic display, but the water was gathered into basins under cover, while above these rose *ædiculas* or columns decorated with statues and even colonnaded porticoes under which one descended by stairs to the fountain itself. Smaller Greek fountains were of various kinds. Those standing at street corners had rectangular or circular basins with a spout, and were uncovered. Numerous road fountains belonged to the same class. Others were free-standing, with water spouting from the mouths of lions or boars set in the upper part of a central column through which the water-supply was carried. Many such fountains are represented on Greek vases, but none remain. Recent excavations by the American School of Classical Studies under Professor Richardson have brought to light one of the largest and most famous of Greek fountains, that of Pirene at Corinth, mentioned by Herodotus and restored by the Romans. It was formed of white stone, and contained a number of cells from which the water flowed into an open basin. The city of Corinth possessed many other fountains. In one near the statues of Diana and Bellerophon the water flowed through

the hoofs of the horse Pegasus. The Fountain of Glaucus, inclosed in the Odeum, was dedicated to Glaucus because she was said to have thrown herself therein, believing that its waters would counteract the poisons of Medea. Another Corinthian fountain had a bronze statue of Neptune standing on a dolphin from which the water flowed.

The fountain constructed by Theagenes at Megara was remarkable for its size and decorations, and for the number of its columns. One at Lerna was surrounded with pillars, and the structure contained a number of seats, affording a cool summer retreat. Mystical medicinal, surgical, and other qualities, as well as supernatural origin, were ascribed to fountains, and they were often connected with temples and shrines. Salt springs were sacred to Poseidon; many curative springs to Æsculapius and Hygieia. One at Cyanæ, in Lycia, was said to possess the quality of endowing all persons descending into it with power to see whatever they desired to see; while the legends of fountains and other waters of strange power to heal are numerous in many lands. The famous Enneacrucos fountain at Athens was called Callirrhœ before the time the water was drawn from it by the nine pipes from which it took its later name. Two temples were above it, according to Pausanias, one dedicated to Demeter and Proserpine, and the other to Tripolemus. The fountain in the Temple of Erechtheus at Athens was supplied by a spring of salt water, and a similar spring supplied that in the Temple of Poseidon Hippias at Mantinea. Above the Heraeum of Argos, the centre of Argive worship, was the famous Asterion Fountain. Often the Greeks made rock excavations to capture the water at its source. Among the most notable of these were that near Syllium in Pamphylia, which still remains; that near Larnaka in Cyprus; and the Burinna Fountain near Cos, covered with a dome. Among the famous fountains consecrated to Apollo were the Castalian fountain and the Cassotis at Delphi, connected with the oracle: vapor and gas in the water contributed to the cult.

The water-supply of Rome and the works auxiliary to it were on a scale to be expected from a people of such great practical power. The remains of the aqueducts which stretched from the city across the Campagna are among the most striking monuments of Italy. The aqueducts supplied the baths and the public fountains, from which last all the populace, except such as could afford to pay for a separate pipe to their houses, obtained their water. These fountains were therefore of large size and numerous. They were formed at many of the castella of the aqueducts. According to Vitruvius, each castellum should have three pipes—one for public fountains, one for baths, and a third for private houses. When Agrippa reorganized under Augustus the city's water-supply, he made or restored 700 fountains, decorating 400 with marble columns and 300 with statues of marble or bronze. The Roman fountains, called *salientes*, were generally decorated with figures and heads. A beautiful marble rhyton at Rome (Palazzo dei Conservatori), a Silenus holding a skin, a Triton with shells, river-gods reclining on rocks, are some of the numerous forms of decoration. These and similar ones belong mostly to the *free-standing* as distinguished from the *niche* class. Fountains were often also the ornament of Ro-

man villas and country houses; the water generally fell from above into a large marble basin, with at times a second fall into a still lower receptacle. Not the least interesting of the Pompeian discoveries are the public and private fountains. The public fountains were comparatively simple and of rectangular shape, as were also the public fountains found at the corner of the forum of Thamugadi (Timgad in Algeria), and at Cuiculi (modern Jemila); but the private Pompeian fountains were of rich and varied shapes, usually of mosaic cubes and shellwork and in the form of a niche. Especially interesting are those of the Casa della grande fontana and the Casa della piccola fontana a mosaico, and those of the Casa del Centenario and of the Casa di Lucrezio. In 1880-81 a particularly beautiful one was found, decorated with a statuette of Silenus and with mosaics of the Birth of Venus and the Bath of Venus and the Loves. The public fountains of Pompeii had little ornament except a human or animal head, from the mouth of which it was arranged that the water should issue. Not only did simple running fountains exist, but the remains of *jets d'eau* have been found; and a drawing exists representing a vase with a double jet of water, standing on a pedestal placed in what is supposed to have been the impluvium of a house. There was also a *jet d'eau* at the eastern end of the peristyle of the Fullonica at Pompeii. The Romans were from the earliest times quite as devoted as the Greeks to the cult of sacred springs and their deities, such as Juturna, Picus, and the nymph Egeria, whom legend made the inspirer of King Numa. The discoveries of votive offerings at mineral and other springs show the cults to have been continuous from the Royal to the Imperial period.

As among the Greeks and Romans, so with the early Celts and other northern tribes, traces of superstitious beliefs and usages with relation to fountains can be traced in monumental and legendary remains. At Lochrist, beneath the church, and at the foot of the hill upon which it is built, is a sacred fountain, near which is erected an ancient chapel. Miraculous virtues are yet attributed to its water, and on certain days the country people still come with offerings to draw it. In the enchanted forest of Broche-lande, famous from its connection with Merlin, was the fountain of Baranton, said to possess miraculous characteristics. The Christian missionaries could not easily overcome beliefs so planted in the hearts of the people, and so strengthened by daily practices. By a wise policy, practiced by the Christian Church everywhere during the stage of conversion, finding themselves unable to eradicate the superstitions which ascribed miraculous power to rocks and woods, streams and fountains, connected with the divinities of the old religions, the evangelists changed their form and direction by dedicating these objects to the Virgin and saints, so making the force of the old belief an instrument for its own overthrow. Fountains were attached to the new religion by the erection of statues of the Virgin or of saints upon the possibly rude structures that collected the water and preserved its purity. There is some uniformity in the architectural characteristics of these structures during the Middle Ages. A very common form in rural districts was that in which the fountain was reached by descending steps. A large basin received the

water, sometimes from a spout, but often from the spring itself. This basin was covered by a sort of porch or vault, with, at times, molded arches and sculptured figures and escutcheons. On the bank of the Clain, at Poitiers, is a fountain of this kind, the Fontaine Joubert, which, restored in 1597, was originally a structure of the fourteenth century, with a niche, bench, and stairs descending to the basin. Many such fountains are found in Brittany, and, indeed, throughout France, and the great antiquity of some of them is proved by the superstitions regarding them which still exist among the peasantry. A form more common in populous districts was that of a large open basin, round, square, polygonal, or lobed in form, with a columnar structure at the centre, from the lower part of which it was arranged that spouts should issue, playing into an open basin, and supplying vessels brought for the purpose in the cleanest and quickest manner. The columns take very varied forms, from that of a simple, regular geometrical solid, with only grotesque masks at the spouts, to that of an elaborate and ornate Gothic structure, with figures of virgins, saints, and warriors, with moldings, arches, crockets, and finials. At Rouen the Pucelle Fountain (fifteenth century) has an elaborately sculptured pinnacle. The most exquisite of all Gothic fountains is in Germany, the *Schöne Brunnen* at Nuremberg, a high polygonal structure like a cathedral tower, a mass of tracery and sculpture (fourteenth century). In the public market-place at Brunswick is a fountain of the fifteenth century, of which the central structure is made of bronze. Except in Italy, few fountains are of earlier date than the fourteenth century. The Italian fountains of the Gothic period are, however, numerous and beautiful; some even belong to the late Romanesque age. The most monumental of these are, perhaps, three at Siena: the *Fonte Branda*, celebrated by Dante, built in the twelfth century; the *Fonte Nuova*, 1259; and the *Fonte Gaja*, 1343. This Siennese type was a large rectangular basin, 35 to 50 feet long, with a solid wall on three sides, and an arcade on the front. At the *Fonte Branda* the covering brick structure is 30 feet high, with three groined vaults; battlements, corbels, and blind arches were its main decorations, but terracotta ornamentation is used already in the *Fonte Nuova* and pilasters, with bas-reliefs and statues in niches by Jacopo della Quercia, and other famous sculptors decorated the *Fonte Gaja*, one of the most beautiful in Italy. Of equal beauty is the *Fontana Maggiore* at Perugia, one of the finest works of Niccolò di Arezzo and Giovanni Pisano (c. 1300). It is a twenty-four-sided polygon; four concentric steps lead up to a lower basin 30 feet in diameter, each face decorated with fine reliefs and separated by grouped colonnettes; from the water of this basin rise twenty-four columns supporting the upper polygonal basin, where angles are marked by statuettes. In the centre of this basin is a heavy bronze column supporting a bronze basin where a group of three water-nymphs now stands. To this general type belong the unrivalled group of mediæval fountains at Viterbo, where the central shaft usually rises from the lower basin, with lion-masks spouting the water supporting a second, much smaller basin on its capital, with a smaller and shorter central shaft supporting a third

basin crowned by a pinnacle. In the Gatteschi fountain the two upper basins are quadrilobed, and the lower one is cruciform. They are always raised on a stepped platform, and stand in the centre of squares. Unlike the Siennese type, these fountains are entirely uncovered.

During the Renaissance the designing of fountains became an important and almost a distinct branch of art, combining in one design the resources of architecture, sculpture, and landscape decoration. Fountains were no longer confined to public squares and purposes of utility, but took their place also in the elaborate decorations of the gardens and parks of the villas or palaces of the great and wealthy. This development began in the villas erected during the middle and late Renaissance in Italy, was carried into France, where in the seventeenth century it culminated in the grandiose water effects of Saint-Cloud and Versailles, and spread into Germany and the rest of Europe. England has in general neglected this branch of decorative art, and its chief centres outside of Italy have been in France and in the capitals of the various States of Germany.

In the Italian villas of the sixteenth and seventeenth centuries water became an essential element of the garden designs, always in connection with a monumental treatment of architectural or sculptural accompaniments, to which the leading artists of the time often devoted their talents. Two types chiefly prevailed—the cascade, in which a moderate volume of water was made to produce a maximum of effect by falling in thin but brilliant sheets over multiplied obstructions—steps, basins, rocks, etc.—always in a framework of architecture with abundance of sculptured accessories; and the isolated or central fountain, in which one or many jets spouted upward fell into the highest of a series of superposed *vasques* or bowls of marble or bronze, and thence into a larger one below, and so on into a broad basin on the ground-level. Of the former type, the most extensive example is the series of cataracts in the Caserta palace gardens near Naples, by Vanvitelli (1753); but notable examples of equal or higher artistic merit are those of the Villa Lante, near Viterbo (Viguda, 1540-50), of the Villa d'Este at Tivoli (Fontana, 1580-?), and of the villas Torlonia-Conti, Aldobrandini, and Mondragone, at Frascati.

The superposed-basin type is seen in numerous admirable examples, not only in the villas, but in the public squares of many towns. Among them may be mentioned the beautiful Farnese fountain in the Lante Villa, near Viterbo; the elaborate fountain in the Piazza Pretoria at Palermo (1550), by Florentine artists; the late and highly rococo Fontana Medina at Naples; the Neptune fountain, by Gran Bologna, at Bologna; the Neptune fountain, by Ammanate, at Florence; the fountain in the Piazza Madonna at Loreto; others at Fano, Viterbo (Piazza della Rocca), the Boboli gardens at Florence, etc. At Rome most of the fountains of this type are of late date—e.g. that about the obelisk of the Quirinal, the great basin fountain of the Villa Albani, the Tortoise fountain in the Piazza Mattei, that in the Piazza Navona, etc. At Rome also are three examples of another type, in which a structure like a triumphal arch pours forth one or more cataracts into a large basin, with or

without sculpture; the Acqua Felice in the Piazza dei Termini (sixteenth century); the Fontana Padina (1612); and the Fontana Trevi, the most spectacular of its type and grandly composed, even if in doubtful taste (F. Fuga, 1740). This type, treated as a wall fountain, is the prototype of several fine fountains in Paris, of which the modern Fontaine Saint Michel, by Dariod, is the most ornate.

Among the earliest Renaissance fountains in France is that of Clermont-Ferrand, an elaborate and beautiful architectural design forming a species of lofty canopy in the centre of a large basin (early sixteenth century). Jean Goujon carved the sculptures for the Fontaine des Innocents, designed by Lescot, in Paris (1550; re-erected in recent times on an altered plan), whose nymphs are famous. He also made the Diana for the fountain at the Château d'Anet. The magnificent basins, jets, and other water-works at Versailles belong to a later date. The French have developed the cascade type into a greater variety of forms than is found in Italy, and have handled these with great taste, not only in such 'châteaux-d'eau' as that of Saint Cloud, but in many recent examples in which sculpture plays an important part (Fontaine Sainte Marie, at Rouen; Fontaine Longchamps, at Marseilles). The central shafted type has also been developed by modern French artists in a number of beautiful examples, such as the twin fountains by Hitorff in the Place de la Concorde, at Paris; the Louvois Fountain, by Visconti (1835); and the Fontaine des Saisons, by Carpeaux, in the Observatory gardens, in the same city. The Birague, Grenelle (by Bouchardon), Molière, and Cuvier fountains, in Paris, should also be mentioned. The fountains at Bern, Switzerland, and the Alameda Fountain at Malaga, Spain, are good examples of the simpler type, with statues on central shafts. There are a number of interesting fountains in Belgium; while at Vienna the Neuer Marktbrunnen (1739), the Hochstrahlbrunnen in the Schwarzenberg Palace gardens, and the Albert Fountain, deserve at least passing mention. The highest artificial jet fountain is that of the Palace of Herrenhausen, Hanover, which is over 200 feet high. But no other European country can compare with France and Italy in the number and beauty of its fountains, considered as works of art.

In the Orient the Greek tradition of covered fountains was continued by the Mohammedan artists, though the Moors in Spain often adopted open basins, as in the Fountain of the Lions in the Alhambra. Each city in the East was provided with many fountains, inclosed and usually covered in like the tombs, with one or more domes. Cairo, Constantinople, Adrianople, and Damascus are especially rich in them, there being three hundred in Cairo alone. They are circular, polygonal, or rectangular, and ornamented with brilliant tiles, niches, columns, carving, inlay, and gilding, and have no display of water even within, for it falls into very small basins from a concealed central supply. The finest of the Turkish fountains is the large and highly ornate Fountain of Ahmet III., near the Mosque of Saint Sophia; another almost equally important is in Scutari, a suburb of Constantinople.

Artificial fountains are not abundant in American cities; yet there are some in the parks and squares of New York and other places that are

occasionally in action. A recent innovation is the rising and subsiding water-jet used in New York. Decorative fountains have played an important part in the design of recent exhibitions in the United States, notably the Fountain of the Republic, by Macmonnies, at Chicago in 1893, and the fountains of Man, Nature, Progress, etc., in the Pan-American Exposition grounds at Buffalo in 1901. Within recent years drinking-fountains for men and animals have been put up more liberally in the United States, especially by private individuals, and are often artificially designed and decorated.

FOUNTAIN OF AR'ETHU'SA. See ALPHIEUS.

FOUNTAIN OF CASTA'LIA. See CASTALIA.

FOUNTAIN OF VAUCLUSE, vò'klúz'. See VAUCLUSE.

FOUNTAIN OF YOUTH. A miraculous fountain having the property of restoring youth and healing sickness. Such fountains are a part of the mythology of many lands. In the Middle Ages a fountain of youth was supposed to exist in an island or region called Bimini, and was sought by Ponce de Leon, De Soto, and other Spanish explorers.

FOUNTAINS ABBEY. An extensive Cistercian monastery near Ripon, England, dating from the thirteenth century. Originally the buildings covered an area of 10 acres, but the picturesque ruins represent only a portion of the abbey. The Norman-English church is in good preservation, and the remains of the refectory, chapter-house, and great cloister are still extant.

FOUQUÉ, fò'kà', FERDINAND ANDRÉ (1828—). A French geologist, born at Mortain, and educated at the Normal School at Paris, where he became curator of the scientific museum. After holding positions in several educational institutions and taking part in a large number of scientific expeditions, he became known particularly for his investigations of volcanoes, and in 1877 was elected to the chair of geology in the Collège de France. He was elected to the Academy of Sciences in 1881. He published a large number of scientific works, among the most important of which are: *Introduction à l'étude des roches éruptives françaises* (1879); *Santorin, et ses éruptions* (1879); *Synthèse des minéraux et des roches* (1882).

FOUQUÉ, FRIEDRICH HEINRICH KARL, Baron DE LA MOTTE (1777-1843). A German romantic novelist and poet, best known as the author of *Undine*, a classic of romanticism. He was born in Brandenburg, served in the Prussian Army from 1794 to 1813, and spent the rest of his life chiefly in Paris, on his estate in Nennhausen, and at Halle, where from 1831 to 1842 he lectured on modern history and poetry. He died in Berlin. At first he imitated Spanish poets, and then Norse legend and Old German poetry attracted him. In 1808 he published *Sigurd der Schlangentöter*, founded on the *Nibelungenlied*, and in 1881 a chivalric romance, *Der Zauberring*. Several dramas and tales of minor worth followed. But in 1814 Fouqué reached, in his *Jahreszeiten*, the summit of his genius, for of its four parts the first was *Undine* and the last *Sintram*. The second part contained *Die beiden Hauptleute*, and the third

Aslaugas Ritter and *Algin und Jucunda*. In this year he also published a romance, *Die Fahrt-en Thiodolfs des Isländers*, which he regarded as his best work. His numerous later writings added nothing to his reputation. His selected works (12 vols., 1841) contain little of import save what has been translated into English—*The Enchanted Ring*; *Sintram*; *Aslauga's Knight*; and the exquisite *Undine*.

FOUQUET, fō'kă', or **FOUCQUET**, JEAN (c.1415-c.90). A French miniature painter and illuminator, born in Tours. His first known works were an illuminated Bible and a portrait of Charles VII. These brought him Court favor, and about 1445 he went to Rome, where he painted the portrait of Pope Eugenius IV. After his return to France he executed a series of miniatures for a French paraphrase of Boccaccio (1458; in the Munich Library), and a *Book of Hours*, forty pages of which were bought by the Duc d'Aumale for the Chantilly Collection, for 300,000 francs. Fouquet became Court painter and illuminator to Louis XI., and in this capacity painted a number of portraits. Little of his life or work was known until some modern historians recognized his value, historically and artistically, as one of the founders of the French School. The illustrations for Josephus's *History of the Jews* (in the National Library, Paris) are perhaps his best work. His drawing is vigorous, the expression of his faces lively, and his color clear and glowing.

FOUQUET, NICOLAS, Vicomte de Melun and de Vaux, Marquis de Belle-Ile (1615-80). Superintendent of Finance under Louis XIV. He was born in Paris, January 27, 1615, the son of a French nobleman high in the confidence of Richelieu. Young Fouquet was educated for the civil service, and from 1642 to 1647 was attached as intendant to the Army of the North. He was then made Commissioner of Police, Justice, and Finance in Dauphiné, and held other important offices, until, in 1648, he was called to Paris as intendant for the municipality, and became involved in the political intrigues of the day. In 1650, through the influence of Mazarin, Fouquet was given the important post of Procureur-Général to the Parlement of Paris. His attitude during the Fronde had won him the regard of the Court, and of Anne of Austria in particular, and in 1653 he was made Superintendent of Finance with a colleague, Servien. His colleague died in 1659, leaving Fouquet alone in office. As chief Financial Minister, Fouquet set himself to work to reorganize the finances of France. Corruption and maladministration, together with heavy war expenses, had drained the treasury, and it is stated that the new Minister had at first to meet expenses by negotiating loans on his own credit. Mazarin soon became jealous of his protégé's influence, and after the Peace of the Pyrenees (1659) and the marriage of the King, an open breach took place in their relations, and henceforth each sought to overthrow the other. In his anxiety to be supreme, Fouquet overdid his part; and on the death of Mazarin, Colbert (q.v.) was consulted regarding the state of the finances, and secretly influenced the King against Fouquet. Meanwhile Fouquet had secured possession of the port of Belle-Ile, and had fortified it as a place of refuge. He also erected a magnificent château on

his estate at Vaux, and there, in August, 1661, he entertained the King with a magnificence and splendor hardly surpassed at Versailles. Louis XIV. would not be conciliated, however, and Fouquet would have been arrested in the midst of the festivities, but for the prayers and intercession of the Queen-mother, Anne of Austria, who was still his friend. There can be little doubt that the charges of maladministration and dishonesty brought by Colbert against Fouquet were substantially true, for the latter was forced to resort to speculation in order to keep up the almost royal state in which he lived. In an age, however, where every one connected with the royal treasury stole, it was Fouquet's only misfortune to be caught. He had been craftily persuaded to sell his office of Procureur-Général and so deprive himself of a trial before the Parlement of Paris. He was arrested at Nantes, in September, 1661, charged with malfeasance in office, to the detriment of the King, and with planning rebellion. His papers were seized and examined. After being moved from prison to prison, he was consigned to the Bastille, and in 1664 was adjudged guilty, after a very unfair trial, and was condemned to perpetual banishment, with confiscation of goods and property. This sentence the King changed to imprisonment for life, and Fouquet was sent to the fortress of Pignerol at the beginning of 1665. During his fifteen years' captivity he composed several works of a devotional nature. He died at Pignerol, March 23, 1680. During the height of his power Fouquet was a generous patron of art and literature, and was intimate with all the literary men of the day. He presented to the Bibliothèque Royale (now Nationale) 13,000 rare volumes which he had collected. He had, however, neither the breadth nor the statesmanship of his contemporary, Colbert. Consult: Cheruel, *Mémoires sur la vie publique et privée de Fouquet* (Paris, 1862); Lair, *Nicolas Fouquet* (Paris, 1890); Hassall, *Louis XIV. and the Zenith of the French Monarchy*, in the "Heroes of the Nations Series" (London, 1885).

FOUQUIER, fō'kyă', JACQUES FRANÇOIS HENRY (1838-1901). A French publicist, born in Marseilles. He studied law and medicine, traveled extensively, pursued a course in art at the Institute in Geneva, in 1861 entered journalism in Paris, and in 1867 was a war correspondent with Garibaldi in Italy. He held various administrative positions in the Department of the Interior, and after several unsuccessful attempts was elected, in 1889, a member of the National Assembly. He was connected editorially with *La Vraie République*, *Le Petit Parisien*, and *Gil Blas*, and in 1891 became the dramatic critic of *Figaro*. His publications include: *Etudes artistiques* (1859); *L'art officiel et la liberté* (1861); *Au siècle dernier* (1884); *La sagesse parisienne* (1885); and a successful play, with M. F. Carré, *Le roman d'une conspiration* (1890).

FOUQUIER-TINVILLE, tăn'vêl', ANTOINE QUENTIN (1747-95). The public accuser of the Revolutionary Tribunal during the Reign of Terror. He was born at Hérouel, in the Department of Aisne, practiced law there for some time, then came to Paris and turned police spy. On the outbreak of the Revolution he figured as one of the fiercest of democrats. By Robespierre he was appointed, first a member, then director and

public accuser, of the Revolutionary Tribunal. He performed the duties of his office with a bloodthirsty relentlessness that came partly from lack of feeling, partly from a brutalized conception of duty. Regarding himself as the servant of the Revolution—though he was in reality only the tool of the Committee of Public Safety—he denounced impartially men of all parties, and brought to the guillotine with equal fervor Bailly and Vergniaud, Danton and Hébert, Robespierre and Saint Just. After the passing of the Reign of Terror he was arrested, and in May, 1795, guillotined, dying bravely enough, and justifying his career in calling himself a blind instrument of the law. Consult Domenget, *Fouquier-Tinville et le tribunal révolutionnaire* (Paris, 1878).

FOURBERIES DE SCAPIN, fōōr'be-ré' de skā'pān', LES. A comedy by Molière (1671), based partly on the *Phormio* of Terence. There is an English translation by Otway (1677), under the title *The Cheats of Scapin*.

FOUR CANTONS, LAKE OF THE. See LUCERNE, LAKE OF.

FOURCHAMBAULT, fōōr'shān'bō'. A manufacturing town in the Department of Nièvre, France, 5 miles by rail from Nevers, near the right bank of the Loire (Map: France, K 4). It contains one of the most important iron-foundries in France, producing bridge materials, rails, car and locomotive wheels. Population, in 1901, 6152.

FOURCROY, fōōr'krwü', ANTOINE FRANÇOIS, Count de (1755-1809). A French chemist. He was born in Paris, the son of a druggist. He became a student of medicine, supporting himself by teaching and translating until 1780, when he received the degree of doctor of medicine. About this time he delivered a course of popular lectures on chemistry and natural history which gained for him a high reputation. Buffon, in 1784, secured his appointment as professor of chemistry at the Jardin du Roi, now Jardin des Plantes, which position he held for twenty-five years. Fourcroy was one of the early converts to the theories of Lavoisier, together with whom, and with Berthollet and Guyton de Morveau, he prepared the *Méthode de nomenclature chimique* (Paris, 1787). In 1792 he was appointed a Deputy to the National Convention; in 1794 he was made a member of the Committee of Public Safety, and in 1795 of the Council of Ancients. During the time of his service he endeavored to improve the system of public education, organized the Ecole Polytechnique, and instituted schools of medicine. Under Bonaparte he became Director-General of Public Instruction, in 1801. He was the author of *La philosophie chimique* (1792); *Système des connaissances chimiques* (11 vols., 1801); and of other works on chemistry, as well as numerous papers on chemical topics.

FOUR-EYED FISH. See ANABLEPS.

FOURIER, fōōr'ryā', FRANÇOIS MARIE CHARLES (1772-1837). A French socialist. He was born at Besançon, April 7, 1772, the son of a merchant, and educated in the college there. At the age of eighteen he entered a cloth business, although from his childhood he had shown an antipathy toward commerce on account of the deception and injustice he saw in it. He visited all

the large cities, not only in France, but in Holland and Germany, as a mercantile agent, thus gaining an opportunity for careful observation of social conditions. At his father's death he inherited 80,000 francs, and invested it at Lyons in colonial products. During the siege of Lyons, in 1793, all his property was destroyed; his bales of cotton were used as breast-works, his provisions were taken to feed the soldiers; and he was himself thrown into prison. Later he entered the army, but he was forced to resign on account of ill health. The rest of his life was spent in mercantile pursuits. In 1799, as agent for a great provision merchant, he had to destroy a large quantity of rice which had been held for higher prices so long that it had become unfit for consumption. The destruction of food needed by the poor made a lasting impression on his mind, and is said to have first turned his attention to social problems. His business enterprises did not prosper, and for the greater part of his life he was in straitened circumstances. His chief works were the *Théorie des quatre mouvements et des destinées générales*, published in 1808; the *Traité d'association domestique agricole* (1822), which contains his whole system, and was later republished under the title, *Théorie de l'unité universelle*; and *Le nouveau monde industriel ou invention du procédé d'industrie attrayante et combinée, distribuée en séries passionnées* (1829). Before his death he had a few followers, the most important one of whom was M. Just Muiron, who was converted to Fourierism in 1814. Fourier died October 10, 1837. After his death his party gained many adherents, among whom were some of the Saint-Simonians. A newspaper was published, and the 'Society for the Propagation and Realization of the Theory of Fourier' was established. See **FOURIERISM**.

FOURIER, JEAN BAPTISTE JOSEPH, BARON (1768-1830). A French geometer and physicist, born at Auxerre. He was the son of a poor tailor, and was left an orphan at the age of eight. The Bishop of Auxerre, recognizing his ability, placed him in a Church military school, where he soon showed a decided aptitude for mathematics. At the age of nineteen he wrote his memoir, *Sur la résolution des équations numériques de degré quelconque*, which was presented to the Academy in 1789. He took part in the Revolution, but in 1795 was sent as a student to the newly founded Ecole Normale, and soon after obtained the chair of analysis in the Ecole Polytechnique (1795-98). He went to Egypt in 1798 and was made perpetual secretary of the Institute of Cairo, and in the following year was placed at the head of one of the two scientific expeditions to the upper Nile. He returned to France in 1801 and was made (1802) Prefect of Isère, a position which he filled with his usual tact and energy. Napoleon created him a baron in 1808; but as, in 1814, he gave brief allegiance to the Bourbons, his political career was wrecked by the return of the Emperor from Elba. He was, after much difficulty, made a member of the Academy of Sciences in 1815, and succeeded Delambre (1822) as perpetual secretary for the mathematical sciences. He later became a member of the French Academy (1826). Fourier was one of the leading mathematical physicists of his time. His labors were divided between the study of the theory of

heat and of numerical equations. Among his leading works are the following: *Théorie analytique de la chaleur* (1822); *Analyse des équations déterminées* (posthumous, 1831); a memoir on statics (*Journal de l'Ecole Polytechnique*, 1797-98); and numerous memoirs on equations. His works, including references to numerous biographical sketches, were published by Darboux under the title, *Œuvres de Fourier* (Paris, 1889-90).

Fourier's Series, communicated by Fourier to the Academy toward the end of 1807, plays an important part in mathematical physics. Consult Du Bois-Reymond, *Zur Geschichte der trigonometrischen Reihen* (Tübingen, 1880).

FOURIERISM. This term is applied to the doctrines of Charles Fourier, and to the communistic movement inspired by Fourier's teaching. Fourier claimed to have discovered a mathematical basis for social organization. The chief difference between the social system which he advocated and those of his contemporaries, Saint-Simon and Owen, is found in the retention, for a time, at least, of private property and inheritance in Fourier's scheme. Fourier believed that man is capable of becoming perfect. His fundamental propositions were that the universe is governed by laws, and that man, by means of reason, can discover these laws and can apply them to the organization of society. When this shall be done, social harmony will reign, and unhappiness will be unknown. As yet, society is in its infancy. The different systems which the human race have established in the past have been only experiments, but each one has been superior to the one which it replaced. This development will continue until perfection is reached. The ideal, according to Fourier, has not been realized because our civilization is false—because the false sciences of ethics, economics, philosophy, and politics are followed instead of the true sciences—chemistry, physics, mathematics. The social organization outlined by Fourier is based on the *passions* or desires of man. There are twelve passions: five sensitive—seeing, hearing, smelling, feeling, and tasting; four affective—amity, love, paternity, and ambition; and three distributive—cabalistic, alternating, and composite. If all these passions are given free play, *passional attraction* causes the spontaneous formation of groups in society. The unit of society must be large enough to allow all the passions to operate freely in all possible combinations, and should therefore consist of about two thousand persons. Each group, or *phalanx*, should occupy a single building and provide itself with all the commodities and amusements desired. The chief occupations are agriculture, manufactures, commerce, domestic economy, art, science, education, and government. Within the phalanx the members are arranged in series and groups according to the law of *passional attraction*. Special corporations are organized for each branch of industry. Individuals enroll themselves for those occupations for which they have natural aptitudes, and are allowed to change from one to another as often as they please. Thus work yields only pleasure. Fourier expected that association would economize expenditure and effort to such an extent that a man would need to work only ten years of his life. Under his system salaries are abolished; each person receives

an ample minimum, and the surplus is distributed according to the amount of labor, capital, and skill contributed—five parts to labor, four to capital, and three to talent. There are no drones, since all the people are anxious to confer benefits upon society. Surplus products are exchanged between phalanxes. Industrial armies are sent out to prepare new lands for occupation. Government, so far as there is any, is republican, with annual election of officers. Since there is no discord, there are no soldiers, policemen, or criminals. At first Fourier expected society to become practically anarchistic, but later he found it necessary to map out a definite hierarchical scheme of government. The unit, of course, is the phalanx, which is ruled by a *unarch*. Three or four phalanxes form a union; three or four unions a district; a number of districts, a province. Nations, empires, caliphates, regions, continents, and finally a world unity are formed by similar combinations. The rulers, in hierarchical succession above the *unarch*, are called *duarchs*, *triarchs*, and so on, up to the *omniarch*, who rules the whole world. In addition to unity of government, there is unity of language, of weights and measures, of surveying. In fact, unity is one of Fourier's fundamental concepts. He maintained that the law of gravitation governs not only matter, but the other three movements—social, animal, and organic—as well. He found three indestructible principles—God, or spirit, the active and moving principle; matter, the passive principle; and justice or mathematics, the regulating principle to which reason corresponds. He expected great transformations to result from a social organization which would allow these natural forces to co-operate freely. Wild animals would willingly become man's servants, the North Pole would become habitable, sea-water would be as palatable as lemonade, and man would develop new organs, such as an eye in the back of his head. Fourier claimed that the human race will remain on this earth until a cycle of 80,000 years has been completed. The period of manhood is at hand. The race will continue to develop for 35,000 years, and then decline for 40,000 years.

After the death of Fourier, his party made a large number of converts in France, and many communities were formed to test his system. In every case where Fourier's suggestions were followed in detail the attempt failed. However, M. Jean Godin has founded at Guise a community where labor and capital are associated much after the plan of Fourier, but with many objectionable features left out. The establishment consists of iron, copper, sugar, and chicory factories, and has been very prosperous. In the United States the system has had little success. Fourierism was introduced in 1842 by Albert Brisbane and spread like an epidemic. No less than thirty-four associations were formed in all parts of the North and West, but few held out more than four or five years. The most notable of all was Brook Farm (q.v.).

Consult: Charles Pellarin, *Charles Fourier, sa vie et sa théorie* (Paris, 1843); Parisot, *Fourier, sa vie, ses œuvres*; E. Sambuc, "Considérations sur Charles Fourier," in *Archiv für Geschichte der Philosophie* (Berlin, 1900); Richard T. Ely, *French and German Socialism in Modern Times* (New York, 1883). For a literary

exposition of the ideals and plans of modern Fourierists, see Emile Zola's novel *Travail*.

FOUR LAKES. A chain of connected sheets of water in Wisconsin, emptying into the Catfish, a northeastern tributary of the Mississippi River (Map: Wisconsin, D 5). They are navigable for steamboats, and drain a beautiful country. The waters are clear and cold. Madison, the capital of the State, lies between Mendota and Monona, the two largest lakes. Their combined area is 230 square miles.

FOUR-LINED SNAKE. See CHICKEN-SNAKE.

FOURMIES, foor'mé'. A manufacturing town and railway junction, in the Department of Nord, France, 36 miles southeast of Valenciennes (Map: France, L 1). It contains numerous cotton and woolen mills and other industrial establishments. Population, in 1901, 14,083.

FOURNEL, foor'nél' FRANÇOIS VICTOR (1829-94). A French author, born at Cheppy, near Varennes, and educated at Verdun and Paris. He went into journalism in Paris, and was attached successively to the editorial staffs of *Le Français*, *Moniteur Universel*, and *Gaulois*. His publications include: *Les contemporains de Molière* (3 vols., 1863-76); *Curiosités théâtrales* (1859); *Esquisses et croquis parisiens* (1876); *Vacances d'un journaliste* (1876); *Voyages hors de ma chambre* (1878); *Aux pays du soleil* (1883); *L'ancêtre* (1881); *Figures d'hier et d'aujourd'hui* (1883); *De Malherbe à Bossuet* (1884); *Petites comédies rares et curieuses du XVIIIème siècle* (1884); *Les artistes français contemporains* (1885); *La confession d'un père* (1886), which was crowned by the Academy; *Maman capitaine* (1889); *Les hommes du 14 juillet* (1890).

FOURNET, foor'ná', JOSEPH JEAN BAPTISTE XAVIER (1801-69). A French geologist and meteorologist, born at Strassburg and educated at the School of Mines in Paris. He took part in several geological exploration expeditions, and in 1834 became professor of geology in the faculty at Lyons, which position he retained until his death. He was an authority upon the geology of the Alps and of southeastern France, and his original investigations were of considerable note, especially his discovery in connection with the sulphurization of metals, which was named from him 'Fournet's law.' He was a prolific contributor to various scientific publications and annals. Among his other publications were: *Géologie lyonnaise* (1862), and *Du mineur, son rôle et son influence sur les progrès de la civilisation* (1862).

FOURNIER, foor'nyá', AUGUST (1850—). An Austrian historian, born and educated in Vienna, where he served in the Ministry of the Interior, and in 1875 established himself as lecturer on Austrian history at the University. Appointed professor there in 1897, he was called in the same capacity to the University of Prague in 1883 and to the Polytechnic School in Vienna in 1899. As a member of the Reichsrat (1891-1900), and of the Bohemian Diet (1892-1901), he belonged to the German Liberal Party. Of his writings, *Napoleon I. Eine Biographie* (1886-89), which was immediately translated into French, is the most noteworthy. Besides many contributions to various periodicals, his other works include: *Gentz und Cobenzl Geschichte*

der oesterreichischen Diplomatie, 1801-05 (1880); *Historische Studien und Skizzen* (1885); *Handel und Verkehr in Ungarn und Polen um die Mitte des 18. Jahrhunderts* (1887); and *Der Kongress von Châtillon* (1900).

FOURNIER, CLAUDE (1745-1825). A French revolutionist, born at Auzon. He went to Haiti, and engaged in the manufacture of rum there, but his factory was burnt; he returned to France and was called for his stay in the New World *L'Américain*. He was active in all the great revolutionary days in the years 1789-92; was accused of plotting the murder of the Orleans prisoners who were killed while under his charge (1792), but was not found guilty; and, in spite of Marat's joining his accusers, was equally fortunate when accused of inciting insurrection. He was in the infernal machine plot of the Rue Saint Nicaise, was found guilty, and deported, and did not return until 1809. In 1811 he was again a conspirator and was sent to the Château d'If; was set free by the first Restoration, and was accused of a plot against the Bourbons after their second return, but set free again in 1816. He spent his last years in parading his royalist sentiments in hopes of a pension, but died a poor man.

FOURNIER, JEAN ALFRED (1832—). A French physician, specialist in skin diseases. He was born in Paris, and was a pupil of Ricord. He was interne in 1854, and in 1863 became physician at the Lourcine Hospital, where he began his studies and lectures on syphilis, on which he has written extensively. He became clinical professor in this branch at the University of Paris in 1880, and after four years at the Hospital Saint Louis.

FOURNIER, PAUL EUGÈNE LOUIS (1853—). A French jurist, born at Calais. He was educated at the Ecole des Chartes, and became professor of Roman law at Grenoble. He is considered an authority on canonical law, in which subject he has written the following important works: *Le Liber Tarraconensis*; "Études sur une collection canonique du XIe siècle" (in *Mélanges Julien Havet*, 1895); "Les collections canoniques attribuées à Yves de Chartres" (in *Bibliothèque de l'Ecole des Chartes*, 1896); *Joachim de Flore: Ses doctrines, son influence* (1900).

FOURNIER, PIERRE SIMON (1712-68). A French type-founder and author. He was born in Paris, and probably received his first instruction from his father, who was director of the foundry of Guillaume Le Bé. In 1736 he established his own foundry, the entire material for which he manufactured himself. Especially celebrated were his ornamented letters. He also contributed greatly to the improvement of musical type, which subject he discussed in a special work. He further had the distinction of publishing the first *Manuel typographique* (1764-66), a work which became exceedingly popular, and remained so long after the death of its author. Among his principal publications may be mentioned: *De l'origine et des productions de l'imprimerie primitive en taille de bois* (1759); and *Traité historique et critique sur l'origine et les progrès des caractères de fonte pour l'impression de la musique* (1765).

FOURNIER, TÉLESPHORE (1824-96). A Canadian jurist, born in Saint François, Quebec. He was educated at Nicolet College, and was

called to the bar of Lower Canada in 1846. In 1863 he was appointed Queen's Counsel. He was elected to the Canadian Parliament in 1870, and became a privy councillor in 1873. In the same year he took his seat as Minister of Internal Revenue in the Mackenzie Cabinet, was transferred to the portfolio of Justice in the summer of 1874, and from May to October, 1875, was Postmaster-General. In the latter month he was appointed a puisne judge in the Supreme Court of the Dominion of Canada, a court which he himself, while Minister of Justice, had organized, and he continued upon the bench until his death.

FOUR-PART WRITING. In music, writing for four different voices. It is the foundation of all composition. The student begins his studies by writing exercises and chorals for four voices, because thus he is enabled to employ all the intervals of a chord of a seventh; and in the case of triads he need only double the fundamental tone. Three-part and two-part writing require more skill, because some interval of a chord must be omitted. Four-part writing employs generally mixed voices, i.e. soprano, alto, tenor, and bass. But four-part compositions for female (two soprano, two altos) and male voices (two tenors, two basses) is also very common. Writing for mixed voices is easier because of the greater range within which the several intervals of a chord may be arranged. Here the composer has three octaves, from A to a², at his disposal, while in writing for male or female voices his range is practically limited to two octaves, from A to a¹ or a to a² respectively. See HARMONY.

FOUR P's, THE. The best-known of the interludes by John Heywood (about 1543). The Four P's are a Palmer, a Pardoner, a Potecary, and a Pedlar.

FOUR PRENTICES OF LONDON, THE. A chronicle play by Thomas Heywood, written about 1600, and printed in 1615 and 1632. It was attacked by Beaumont and Fletcher in *The Knight of the Burning Pestle*.

FOUR SONS OF AYMON, THE. See AYMON.

FOURTH. See INTERVAL.

FOURTH DIMENSION. See GEOMETRY.

FOURTH PARTY, THE. A name applied, about 1880 to an opposition group within the English Conservative Party, under the leadership of Lord Randolph Churchill (q.v.).

FOURTH STATE OF MATTER. See MATTER, Section *Theories of Matter*.

FOURTOU, foor'too', OSCAR BARDY DE (1836-97). A French legislator. He was born at Ribérac (Dordogne), and was educated at Poitiers. After acting as mayor of his native town, he was elected a member of the National Assembly in 1871. Thereafter he successively became Minister of Public Works (1872), Minister of Public Instruction (1873-74), and Minister of the Interior (1874 and 1877). He was identified with the Clerical Bonapartist Party, and as Minister of the Interior conducted a vigorous and aggressive campaign against the Republicans. He dismissed all prominent representatives of that party then holding office, and appointed Bonapartists to the positions thus vacated. Particularly aggressive was his attitude toward the Republican press, which for a time was subjected to a relentless persecution.

FOVILLE, fô'vel', ALFRED DE (1842—). A French political economist and statistician, born in Paris and educated at the Polytechnical School in that city. He served successively as auditor of the Council of State, chief of the Bureau of Statistics, and professor at the School of Political Science. In 1877 he became editor of the *Bulletin de statistique et de législation comparée*. His publications include: *Mémoire sur les variations des prix au XIXème siècle* (1872); *Atlas de statistique financière* (1881 and 1889); *La richesse en France et à l'étranger* (1893); *L'industrie des transports dans le passé et dans le présent* (1893).

FOWEY, foi. A seaport town of Cornwall, England, on the south coast, 22 miles west of Plymouth (Map: England, B 6). It is noted for its picturesque situation amid hill and cliff scenery, and is a favorite artist resort. It has a deep harbor, with a narrow entrance guarded by three forts, and in the thirteenth and fourteenth centuries was one of the chief seaports of England. Its principal industry is the pilchard fishery, and it has a considerable export trade in the chinastone and iron ore of neighboring quarries and mines. Population of parish, in 1891, 7020; in 1901, 7691.

FOWKE, GERARD (born SMITH) (1855—). An American archæologist and ethnologist, born in Maysville, Ky. For many years he was connected with the United States Bureau of Ethnology in investigations in the Eastern United States, and in the Ohio Valley. The results of his discoveries were published in the *Annual Reports* of the Bureau. In 1894 and 1896 he investigated the supposed Norse remains near Boston. Afterwards he was engaged in explorations on Vancouver's Island, and in 1898 explored the lower Amur River, Siberia, for the American Museum of Natural History, New York City.

FOWL (AS. *fugol*, OHG. *fogal*, Ger. *Vogel*, Goth. *fugls*, bird, fowl). A word commonly used now in a restricted application to useful birds, chiefly of the gallinaceous order. Thus, 'wild fowl' and 'water-fowl' mean those birds of land and water respectively in which sportsmen are interested, and 'barnyard fowl' are the domesticated kinds—poultry. When used in the singular, however, the word almost invariably signifies a full-grown domestic chicken.

DOMESTIC CHICKENS. Chickens are raised in the United States for their flesh, for the production of eggs, and as fancy stock for exhibition purposes. According to Howard there are 87 standard and a large number of promiscuous varieties of chickens raised in the United States, which have been divided into 10 classes. For practical purposes the 10 classes may be grouped into four general classes as follows: (1) General-purpose breeds, the American class; (2) meat or table breeds, the Asiatic class; (3) egg-making breeds, the Mediterranean class; (4) ornamental breeds, the Polish, exhibition games, miscellaneous, and bantam classes.

The *Plymouth Rock* is the most popular of all breeds of chickens for general purposes. It is of medium size, hardy growth, and good egg-laying qualities. The barred variety is the most generally known. It is of a grayish-white color, regularly crossed with parallel bars of blue-black running in straight distinct lines throughout the entire length of the feathers. The standard

weight of the cocks is nine and one-half pounds; and of hens, seven and one-half pounds. Other varieties of Plymouth Rock are very like the barred except in color. The *Wyandottes* are rated next to the Plymouth Rocks as general-purpose fowls. The *Light Brahma*, which became popular between 1850 and 1860, is the leading variety of the Asiatic class. The male is pure white in color excepting the hackle, tail, and flights, which are black, and white striped with black. The shanks are well feathered, with the feathering extending down to the middle toe. The *Brahma* female has a white head; hackle white, striped with black; cape white and black, completely covered by the hackle when the bird stands erect. The average *Light Brahma* male is 26 inches in height. The standard weight of the cock is 12 pounds; of the hen, nine and one-half pounds. The *Cochins* are second only to the *Brahmas* for edible purposes, weighing somewhat less than the *Light Brahmas*. There are several varieties of *Cochins*: Buff, partridge, black, and white. All have heavy leg and foot feathers. The *Leghorns* are the best known of the egg-producing varieties of the Mediterranean class. They mature early and feather quickly. The pullets often begin laying when four months old. There are a number of varieties of *Leghorns* which differ in color and in the form of comb, which in all cases is large and a distinguishing mark of the breed. The *Leghorn* cock has a graceful, round and plump body, broad at the shoulders and tapering toward the tail. The *Leghorn* hen in many respects resembles the cock in shape and carriage, and is even more graceful. The ornamental breeds vary greatly. Bantams are characterized by their small size; the silky fowls by their soft webless feathers, which when in prime condition are less fluffy and stand out from the body in all directions; and the *Yokohama* fowls by the great length of the tail and hackle feathers, the tail-feathers of the cock sometimes attaining a length of six feet or more. The *Games* are commonly divided into two distinct varieties—exhibition and pit. The exhibition game is long, lanky, close-feathered throughout and spare in tail-feathering. The pit is short, stout and stocky, with abundant tail-feathering, and for the farm and general purposes has always been considered a practical and profitable fowl. It is hardy, matures early, is a good layer, and its flesh is considered of exceptional value for the table, being fine-grained, tender, and sweet. The hens are splendid sitters and careful mothers. See Plate accompanying article POULTRY.

INDUSTRIAL CONSIDERATIONS. Chicken-raising, an important industry whether conducted as a special business or as a part of general farming, depends upon suitable houses and proper care and feeding. It is very desirable that chickens be provided with a house somewhat separated from the other farm buildings, but near enough to the barnyard so that they can spend a part of their time in scratching for and gathering up the many seeds and grains that would otherwise not be utilized. Poultry-houses need not be elaborate in their fittings or expensive in their construction. Material and construction will vary in different regions, but the houses should always be planned with regard to cleanliness and convenience. They should be cool in summer and warm in winter, and, when it is not desirable to allow poultry free range, the houses should be provided with yards or runs, because chickens need exercise.

Coops for young chickens are of various styles, some being very simple, and others provided with yards covered with netting to exclude hawks and cats. The poultry-house should be located upon soil which is well drained and dry. A gravelly knoll is best, but, failing this, the site should be raised by the use of the plow or scraper until there is a gentle slope in all directions, sufficient to prevent any standing water even at the wettest times. A few inches of sand or gravel on the surface will be very useful in preventing the formation of mud. A group of evergreens or other windbreak will be a decided advantage in sheltering the house from the north and north-west winds in the colder parts of the country.

The amount of space to be allowed per chicken depends upon the size of the fowls, whether a shed is attached to the house, and whether the fowls have free run of the open fields. For chickens in confinement there should be from six to fifteen square feet for each adult bird in case there is no shed attached to the house; with a shed this space may be reduced about one-half. The yards should be large enough to allow exercise in the open air, and to furnish more grass than the birds will eat. This will vary from 60 to 150 square feet per adult bird. An open shed facing the south is of great assistance in maintaining the health and productiveness of the flock. In it the birds can be induced to hunt for their food and take exercise in all seasons of the year, and where they can enjoy scratching and dusting themselves in the sunshine, even during the winter months. Chicken-houses provided with earth floors are frequently damp and unsatisfactory, and the cause of various poultry diseases. Cement floors are cold, and also more or less damp. According to D. A. Salmon, who is authority for many of the statements given here, a good cement floor laid on broken stone, and covered with a few inches of earth, would probably be satisfactory, if not too expensive. A board floor, six or eight inches above the earth, with good ventilation under it, is dry but too cold, except in the South. A double flooring, laid tightly with building paper between, or a good single flooring covered with a few inches of dry earth, is probably the best. In all cases of board floors there should be sufficient space beneath for ventilation, and to guard against lodgment of rats. Convenient roosts should be provided. They should be nearly flat or rounded slightly on the upper surface. Crevices in which vermin may hide should be avoided. Such precautions suffice in most cases to keep the poultry free from chicken-lice, the characteristics of which are given under LOUSE. The roosting-space allowed should be 6 to 8 inches for the small breeds, 8 to 10 inches for the medium, and 10 to 12 inches for the large breeds of chickens.

NESTS AND EGGS. Suitable nests are an essential requirement for egg-laying stock. The simplest form of nest is a box placed upon the floor of the poultry-house. With heavy fowls, which are apt to break their eggs in fighting away other hens that try to enter their nests when they are laying, and thus acquire a habit of egg-eating, a more concealed or dark nest may be necessary. Although on small farms, in towns, and in villages it is generally necessary to confine poultry in houses and yards, there are many large farms where poultry may be raised with the greatest economy by allowing them to range.

The large area at their disposal furnishes an exhaustive supply of insects and worms, and an abundance of water, seeds, and grains which chickens alone can utilize. Under such circumstances fowls take care of themselves so well, and are so energetic in seeking their food, that they are either forgotten, and allowed to shift for themselves when they really need attention and assistance, or they are regarded as a nuisance because they sometimes do a little damage. When fenced away from the garden and flower-beds, fowls do little damage, and cause scarcely any annoyance on a farm. On the other hand, they do an immense amount of good in the protection of crops by the destruction of injurious insects, larvæ, and worms, and are especially useful on fruit farms. Eggs are hatched under the hens or in incubators. Incubator chicks may be conveniently cared for in brooders or 'artificial mothers.' Many incubators and brooders have been devised which have been shown by experience to be satisfactory.

FEEDING. Chickens require a mixed diet of grain, animal food, and green or succulent materials. The food must also supply the lime and other mineral matters needed for egg-shells, and an abundance of grit, required for digesting food, is also essential. Pure water should at all times be provided. A number of forms of drinking-fountains have been provided to meet the latter requirements. When only a small flock of hens is kept, chiefly to provide eggs for family use, a mistake is frequently made in feeding too much corn. It has been shown by experiments that corn should not form a very large portion of the grain ration of laying hens, as it is too fattening, especially for hens kept in close confinement. Corn, no doubt because of its cheapness and abundance, has generally been considered in the United States to be the most valuable poultry food. In recent years, more than formerly, wheat has been fed and the poultry ration thereby improved. Wheat is preferable to corn, and oats are an excellent food, better, perhaps, than any other single grain, particularly if the hull has been removed. When comfortable quarters are provided, fowls kept for egg production should have a ration with a nutritive ratio of about 1:4. When poultry is fed for the production of flesh, the ration should contain more fat and carbohydrates in proportion to the protein; that is, it should have a wider nutritive ratio than the ration cited for egg production. For forcing fowls for egg production, as in forcing animals for a large yield of milk, the ration should be made up of a number of kinds of grain. Experiments have shown that fowls not only eat their food with better relish if it is composed of many kinds of grain, but that the proportion digested is larger than when made up of fewer constituents. The food consumed has an effect upon the flavor of eggs, and in extreme cases upon the odor also. Thus, onions when fed for a considerable time produce a noticeable flavor in eggs. The majority of poultry-raisers believe that ground food or soft food should form a part of the daily ration, and that it is desirable to feed soft food in the morning, as it will be digested and assimilated quicker than will whole grain. A mixture of equal parts by weight of corn-meal and ground oats added to an equal quantity of wheat, bran, and fine middlings is recommended as a satisfactory food if mixed

with milk or water. It should be thoroughly wet without being sloppy. The dry grain ration should consist largely of whole wheat with some oats and perhaps a little cracked corn. This should be scattered in the litter, which should always cover the floor of poultry-houses, in order that the fowls be compelled to seek the corn, and thus obtain a considerable amount of exercise. The litter also insures cleanliness. Straw, chaff, buckwheat hulls, and cut corn-stalks all make excellent litter. At night, just before the fowls go to their perches, they should have all the corn they will eat up clean. Some green food should be given to poultry, although perhaps it is not absolutely necessary. Clover, rape, cabbage, etc., are recommended for the purpose. Green food is especially desirable when chickens are kept in yards throughout the entire year.

FOWLS AS FOOD. The flesh of chickens is esteemed for its delicate flavor. The young chickens are often spoken of as broilers. For composition and food values of broilers and fowls, see tables under Food.

Chickens are ordinarily broiled or fried, roasted or baked, boiled or stewed, and are seasoned and garnished in many different ways. While delicate flavor and appetizing appearance contribute to the popular esteem in which poultry are held in all regions, there is an additional reason for their extended use in warm climates. This is the fact that poultry may be kept alive and killed as they are needed for the table; thus when means of cold storage are absent, the loss from spoiling may be much more readily avoided than is the case with larger animals used for food. It is commonly believed that the flesh of poultry is quite thoroughly and easily digested, and thus especially suited for the diet of invalids. The value of eggs as food and their place in the diet are discussed under the title Eggs.

BIBLIOGRAPHY. A very large number of books have been published on the general subject of poultry, among which are the following: Wright, *The Book of Poultry* (London, Paris, Melbourne, 1891); Watson, "Fowls, Care and Feeding," in *United States Department of Agriculture Farmers' Bulletin 41* (Washington, 1900); Howard, "Standard Varieties of Chickens," in *United States Department of Agriculture Farmers' Bulletin 51*, illustrated (Washington, 1900); A bibliography of *Poultry Literature*, *United States Department of Agriculture, Library Bulletin 18* (Washington, 1899); McGraw, "The Plymouth Rock," and "The Wyandotte," in *United States Department of Agriculture, Bureau of Animal Industry Bulletins 29 and 31* respectively (Washington, 1901); Salmon, "Poultry Raising on the Farm," in *United States Department of Agriculture, Bureau of Animal Industry, Bulletin 141* (Washington, 1900).

FOWL CHOLERA. A virulent infectious disease of poultry common in Europe and America, which takes the form of a septicæmia, and is due to a specific micro-organism. It was first studied in 1782, and was referred to anthrax. Chickens are especially susceptible, but it occurs also in geese, ducks, pigeons, and even rabbits. Three forms of the disease are recognized: the apoplectic, the acute, and the chronic. In the first form the bird becomes suddenly dull, the wings droop, the eyelids fall and the feathers are elevated, the comb soon

turns purple, the temperature rises to about 43° C., and death occurs within from two to five hours. In the second form the same symptoms appear with the addition of acute diarrhœa, but the bird afflicted may suffer from twelve to sixty hours or perhaps recover after the diarrhœa has persisted for about two weeks. In the chronic form a permanent or an intermittent diarrhœa is the most marked symptom, and death from extreme emaciation and exhaustion is postponed for some weeks.

The micro-organism may gain entrance to healthy birds through the mucous membranes of the eye, respiratory and alimentary tracts. The blood, all mucous and serous secretions, and excrementitious matter from affected birds are virulent; but when exposed to heat, fresh air, or direct sunlight, they become innocuous. The virus may be destroyed by a one per cent. solution of salicylic, benzoic, or carbolic acid. Healthy birds may be immunized by inoculation with attenuated virus or with serum from immunized birds. No medicinal treatment is of any avail in the apoplectic and acute forms. In chronic cases dilute acids sometimes assist the birds to recover. After an outbreak of this disease, the poultry quarters should be cleaned and disinfected. Healthy birds should not be allowed to run on the ground where diseased birds have been. Consult: Salmon, *Poultry Diseases* (Washington, 1899); Theobald, *Parasitic Diseases of Poultry* (London, 1896).

FOWLER. A libertine in Shirley's *Witty Fair One*, who is made to believe that he has died, and is atoning for his vices as a spirit.

FOWLER, CHARLES HENRY (1837—). An American clergyman of the Methodist Episcopal Church, born in Burford (Ontario), Canada. He graduated at Syracuse University in 1859, at the Garrett Biblical Institute (Evanston, Ill.) in 1861; entered the ministry of the Methodist Episcopal Church in the Rock River Conference in 1861, and held various pastorates in Chicago, Ill. From 1872 to 1876 he was president of the Northwestern University (Evanston and Chicago, Ill.), in 1876 became editor of the *Christian Advocate*, the leading periodical of the Methodist denomination in America, and in 1880 missionary secretary. In 1884 he was elected a bishop. He visited South America in 1885, and organized there a very efficient missionary work. Three years later (1888), on a tour of visitation around the world, he founded the Pekin University and the Nankin University in Central China, and organized the first Methodist Episcopal Church in Saint Petersburg, Russia. He further assisted in establishing the Nebraska Wesleyan University (University Place, Neb.), and greatly improved the condition of the Methodist Episcopal Church in San Francisco, Cal. He became favorably known as a preacher and occasional speaker, and won recognition as an able administrator. He wrote *Colenso's Fallacies* (1864).

FOWLER, ELLEN THORNEYCROFT (c.1873—). An English novelist, eldest daughter of Sir Henry Fowler, Secretary of State for India (1894-95). Miss Fowler lives at Woodthorne, Wolverhampton, Staffordshire. After publishing several volumes of mediocre verse, and a volume of short stories (*Cupid's Garden*, 1897), she at once gained popularity by a clever society novel en-

titled *Concerning Isabel Carnaby* (1898). It has been followed by *A Double Thread* (1899); *The Farringtons* (1900); *Sirius and Other Stories* (1901); a volume of poems entitled *Love's Argument* (1900); and *Fuel of Fire* (1902).

FOWLER, FRANK (1852—). An American figure and portrait painter, born July 12, 1852, in Brooklyn, N. Y. He was educated by private tutors and at the Adelphi Academy in that city. After leaving school he studied for two years in Florence, Italy, under Edwin White. From Florence he went to Paris, where he studied for seven years under Carolus Duran and Cabanel, and at the Ecole des Beaux-Arts. He rendered valuable assistance to Duran on the fresco of Marie d' Medici at the Luxembourg. He has painted a number of public men, notably Governors Tilden and Flower, also Archbishop Corrigan, Charles A. Dana, and others. He received medals at Paris and Atlanta. He has written a large number of articles on art topics for the magazines, and a book, *Portrait and Figure Painting*, besides various text-books on drawing and portrait painting. His technique is broad, with a fresh and delicate treatment, and he gives a faithful rendering of his subjects, with a poetic and imaginative conception.

FOWLER, HAROLD NORTH (1859—). An American classical philologist, born at Westfield, Mass. He received the degree of A.B. from Harvard University in 1880, and Ph.D. from Bonn in 1885. He was professor of Greek in the University of Texas, 1892-93, and in the College for Women, Western Reserve University, from 1893; was associate editor of the *American Journal of Archaeology*, and editor of Thucydides, book v. (Boston, 1888), and of Plautus's *Menæchmi* (Boston, 1889), etc.; and is the author of various philological papers and reviews.

FOWLER, HENRY HARTLEY (1830—). An English statesman, born at Durham. He was a Liberal member of Parliament for the undivided Borough of Wolverhampton from 1880 to 1885, when he was returned for the East Division. At the close of the Gladstone Administration of 1880 he was Under-Secretary at the Home Office (1884-85). He became Financial Secretary to the Treasury and a privy councillor in 1886, and from 1892 to 1894 was president of the Local Government Board, in which office he carried through Parliament the Parish Councils Bill. In 1894-95 he was Secretary of State for India, and in the latter year was knighted.

FOWLER, SIR JOHN (1817-98). A British hydraulic and railway engineer. He was born in Sheffield, England, and after engaging in various important works, he became acting engineer in the construction of the Stockton and Hartlepool railways. At the age of twenty-seven he was selected as engineer for the construction of the large group of railways known as the Manchester, Sheffield, and Lincolnshire. Having settled in London, he was continuously employed in the laying out and construction of railways and docks, and in the improvement of rivers and reclamation of lands from the sea. He designed and constructed the Metropolitan Underground Railway of London; with Sir Benjamin Baker designed and constructed the great Forth bridge (1890); was for many years consulting engineer to the Egyptian Government, and was made a baronet in 1890.

FOWLER, LORENZO NILES (1811-96). An American phrenologist and lecturer, the brother of Orson Squire Fowler (q.v.). He lived in England in 1863-96. Besides works which he wrote jointly with his brother, he published: *Synopsis of Phrenology and Physiology* (1844); and *Marriage, its History and Philosophy, with Directions for Happy Marriages* (1846). He was also concerned in the publication of the *American Phrenological Journal*, and the *Water Cure Journal*, afterwards called *Science of Health*.

FOWLER, ORSON SQUIRE (1809-87). An American phrenologist. He was born in Cohocton, Steuben County, N. Y., and was educated at Amherst College, where he graduated in 1834. While studying mental philosophy at college he became interested in phrenology, to the study of which he devoted all his spare time. After graduating he settled in New York, where, in conjunction with his brother Lorenzo, he began writing and lecturing on phrenology. In 1836 he published his first book, *Phrenology Proved, Illustrated, and Applied*, and in 1838 he founded the *American Phrenological Journal*, which he edited until 1865. During the rest of his life he spent the greater part of every year lecturing on phrenology throughout the United States and Canada. Before the Civil War he was an ardent abolitionist, and later became much interested in temperance work. He was the founder of practical phrenology in the United States. Among his numerous published works are: *Memory and Intellectual Improvement* (1841); *Physiology, Animal and Mental* (1842); *Matrimony, or Phrenology Applied to the Selection of Companions* (1842); *Self-Culture and Perfection of Character* (1843); *Hereditary Descent, Its Laws and Facts Applied to Human Improvement* (1843); *Love and Parentage* (1844); *The Self-Instructor in Phrenology and Physiology* (1849); *Sexual Science* (1870); and a number of other works in collaboration with his brother.

FOWLER, THOMAS (1832-). An English educator and philosopher, president of Corpus Christi College, Oxford. He was born in Lincolnshire, and was educated at King William's College, Isle of Man, and at Merton College, Oxford, where he graduated in 1854. In 1855 he became a fellow and tutor of Lincoln College, Oxford. He won the Denyer Theological Essay prize in 1858, was made select preacher in 1872, and was elected professor of logic in 1873. This chair he occupied until 1888, becoming meantime (1881) president of Corpus Christi College. From 1899 to 1901 he was vice-chancellor of the University of Oxford. His publications include: *The Elements of Deductive Logic* (1867, 10th ed., 1892); *The Elements of Inductive Logic* (1870, 6th ed. 1892); *Locke*, in "English Men of Letters" (1880); *Bacon's Novum Organum* (1889); *Locke's Conduct of the Understanding* (3d ed. 1890); *Francis Bacon* (1881) and *Shaftesbury and Hutcheson* (1882), in "English Philosophers Series"; *History of Corpus Christi College* (1893); *Progressive Morality: An Essay in Ethics* (1895). He was also joint author with J. M. Wilson of *Principles of Morals* (1885-87).

FOWLING. See HUNTING.

FOX (AS. *fox*, OHG. *fuhs*, Ger. *Fuchs*, fox, Goth. *fauhō*, vixen; possibly connected ultimately

with Skt. *puccha*, tail). A member of a group or 'alopecoid series' of canine animals, more easily distinguished from the wolves, dogs, or jackals of the same family (Canidæ) by outward appearance than by zoölogical differences. They are, in general, of smaller size and less proportionate height; have longer hair, usually more reddish or yellowish than gray; larger, more triangular and furry ears; a more slender pointed muzzle, with straighter jaws; and a longer and more bushy tail, than their allies. Some zoölogists refuse to separate them even as a genus, but most students place them in the genus *Vulpes*, and still further separate the American gray fox as *Urocyon*, and the little African long-eared foxes as *Fennecus*. The anatomical characters upon which *Vulpes* is distinctly based are principally found in the skull, where "the bony projection forming the hinder border of the socket of the eye is regularly curved downward and has a convex upper surface" in the wolves and jackals; "whereas in the fox the same process is hollow above, and has a more or less marked tendency to curve upward behind"; also, the air-chambers in the frontal bones of the wolves are absent in the foxes. Another constant distinction is found in the pupil of the eye, which, when contracted, is round in the dog-like canines and elliptical in the foxes. The true foxes (apart from the African fennecs) are scattered throughout all the northerly regions of the world, from the edge of the tropical zone to the highest Arctic lands, but none are known in the Southern Hemisphere. The number of species is indeterminate, conservative naturalists regarding as local varieties various forms to which others give specific names.

All inhabit holes in the earth, usually of their own digging, but do not hibernate, are nocturnal, and subsist mainly upon animal prey which they capture by stealthy approach and a quick rush; and all utter yelping cries, and breed annually. They are believed not to have contributed in any appreciable degree to the ancestry of any race of domesticated dogs, and although everywhere highly intelligent in their field of thought, are rarely tamed as pets or trained to perform tricks well. The typical and best-known species is the European red fox (*Vulpes vulgaris*), the hero of British fox-hunting (see FOX-HUNTING), and the *renard* or *Reinecke Fuchs* of European folk-lore. (See Colored Plate of CANIDÆ.) It is spread over the whole of Europe and Asia, and is also found in Asia Minor and along the south shore of the Mediterranean. The ordinary type, familiar in Great Britain and western Europe, is reddish brown above and white below, with the outer portions of the ears and feet black, and the tip of the 'brush,' or tail, white. Its length may vary from 27 to 46 inches, exclusive of the tail, which is itself from 12 to 15 inches long. Colors and markings vary greatly, however, as well as size and proportions. The habits of the common fox in England are thus sketched by Lydekker and Bell, and the essential facts apply to the animal in all parts of its range:

"Although the fox is by no means averse to taking possession of the deserted burrow of a rabbit or a badger, it generally excavates its own 'earth,' in which it spends a considerable portion of its time. As all hunters know, foxes frequent-

1. KIT FOX (*Vulpes velox*).
2. LALANDE'S FOX-DOG (*Otocyon Lalandii*).
3. FENEC (*Canis zerda*).

4. CORSAC (*Canis corsac*).
5. GRAY FOX (*Urocyon cinereo-argentatus*).
6. JACKAL (*Canis aureus*).

ly prefer to live out in the woods, those with a northern aspect being, it is said, generally avoided. Sometimes these animals will prefer a thick hedgerow or a dry ditch, while we have known them to select the tall tussocks of coarse grass in swampy meadows as a resting-place; and they have also been found in straw-ricks, where it is on record that in one instance cubs have been born. The breeding time is in April, and the usual number of young in a litter is from four to six. The prey of the fox consists, writes Bell, 'of hares, rabbits, various kinds of ground birds, particularly partridges, of which it destroys great numbers; and it often makes its way into the farmyard, committing sad havoc among the poultry. It has been known not infrequently to carry off a young lamb. When other food fails, the fox will, however, have recourse to rats and mice, and even to frogs and worms; while on occasion beetles are largely consumed, and on the seashore fish, crabs, and mollusks form a part of its diet. Carrion seems never to come amiss, while the old story of the fox and the grapes alludes to the fruit-eating propensities of these animals.' The usual cry of the fox is a yelping bark. The well-known scent of the fox is secreted by a gland situated beneath the tail. The cunning exhibited by English foxes in escaping from hounds has been so often described that we shall make no further allusion to it here, beyond saying that it has probably attained its present development as the result of the inherited experience of many generations. The life of the fox is a precarious one; the huntsman is his friend and the gamekeeper his foe; and were he not specially protected for the sport he gives to hounds and men, he would, like the wolf, have long since been extinct in England. That the fox is an ancient inhabitant of the British Islands is proved by the occurrence of its fossilized remains in caverns in company with those of the mammoth and other extinct animals. This, however, is not all, for a skull . . . has been dug up from the sands lying at the top of the Red Crag of Suffolk, which are vastly older than the mammoth period."

As the Old World fox is traced eastward distinct local varieties are encountered, which, however, intergrade. Thus a black-bellied fox is characteristic of southern Europe, and is decidedly different from the ordinary colors of the North African variety. The dry plains of western Asia support a paler form, and this is succeeded eastward by two much larger types of the eastern and western Himalayas, which, in winter, when the coat is long and the colors are heightened, are extremely handsome; a characteristic marking among these is a dark stripe athwart the shoulders. Siberia, China, and Japan likewise have varieties of this same one species, which, if the American red fox be also included, ranges throughout almost the entire Northern Hemisphere, and has the most extensive distribution of any of the Canidæ. Asia possesses some other very distinct species of foxes, nevertheless, of which the most familiar is the small, alert, and pretty Indian fox (*Vulpes Bengalensis*) to be met with all over Hindustan, except in thickly forested regions. It is rarely hunted by scent, with foxhounds; but frequently affords good sport by coursing with greyhounds. Three other

species of 'desert' foxes, all pale and yellowish in hue, belong to the open sandy plains and tablelands between Arabia and Afghanistan. One of these is the widely spread desert fox (*Vulpes leucopus*); another, the better-known corsac (q.v.), and the other varieties inhabit Thibet and Afghanistan. The earliest fossil remains of distinctly canine beasts are fox-like animals of the Middle Tertiary period.

AMERICAN FOXES. Several species of fox are characteristic of North America. The most widespread and conspicuous is the red fox, called by American zoölogists a distinct species (*Vulpes Pennsylvanica*), but regarded by European students as a local phase of the circumpolar 'common' fox, heretofore described. It is hard to distinguish it in the normal type from the European fox, though the colors are, on the average, rather brighter; and it varies on our continent quite as diversely as does the fox of the Old World. The normal red fox remains common in spite of the civilization of the country throughout the eastern United States and Canada, westward to the Plains, as far south as northern Georgia; and reappears west of the Rocky Mountains and thence to the Pacific Coast in a paler large-tailed form. In the far north occur more rarely two other varieties—the cross fox and the silver fox. The former is simply a more or less normal red fox, marked sometimes strongly, sometimes indefinitely, with a dark cross on the back and shoulders, fine specimens of which are given a superior value by traders in peltries. The latter, or silver fox (var. *argentata*), is much rarer, and is black, with a silvered or hoary appearance due to many of the hairs being tipped with white; the tail is black with a white tip, and the soles of the feet are hairy, fitting it for life amid ice and snow. Good pelts of the silver fox are extremely valuable. That both these are merely phases of the red fox is plain from the fact that they may be born in the same litter with normally red cubs. Foxes totally black also occur frequently in the Hudson Bay region. The American red fox had originally much the same habits as those of the European animal, seems to be deserving of quite as much credit for sagacity and acuteness, and has learned to accommodate itself as well to the exigencies brought by civilization and the chase. The writings of American naturalists and sportsmen abound in interesting stories of its alertness, ingenuity, and adaptiveness, and show that it has spread and survived in the United States, where the gray fox has diminished.

A small grayer species of the southern California coast (*Vulpes macrotis*) is conspicuously distinguished by its great ears.

The Kit, Swift, or Burrowing Fox (*Vulpes velox*) is a well-marked species of the dry plains of the United States, whose range extends from Colorado and Nebraska north to the Saskatchewan Valley. It is small, only about 20 inches long, slender and compact in form. Its color is yellowish-gray on the upper surfaces, fading through reddish to white on the belly and legs, and there is a black patch on each side of the muzzle. The ears are short and densely furred, and the soles of the feet are overgrown with long woolly hair, like those of the Arctic fox. It digs burrows with skill and speed, feeds upon small rodents, insects, small birds and their eggs, etc.,

and is remarkably swift of foot and dexterous in hiding. Its fur becomes thick in winter and pale gray in color, rendering it nearly invisible. See Plate of FOXES AND JACKALS.

The Blue or Arctic Fox (*Vulpes lagopus*) is one of the most interesting of all the species. It is known all around the Arctic shores, and in summer is a variable brown (even sooty in some cases) on the upper parts, and yellowish-white on the ventral surfaces, throat, etc.; the under fur, however, is everywhere dull blue. This bluish tint frequently appears in the summer dress in patches in the foxes of all regions; but in those of the Aleutian Islands and southeastern Alaska it characterizes the whole pelage, and gives the name 'blue' fox to the animal in that region. E. W. Nelson, who describes it at length in his *Natural History of Alaska* (Washington, 1887), concludes that this is the typical, original form, from which the brownish and blackish foxes elsewhere are variants. The blue foxes remain of that color all winter, putting on a longer, thicker coat as cold weather approaches; but elsewhere all the Arctic foxes become purely white about October, and remain so until spring, rendering them almost invisible upon the snow and aiding them to steal upon their prey. They are animals of the open country and seacoast, and in winter they often visit the Eskimo villages or come close to their camps, and are easily trapped. "Parts of the country," says Nelson, speaking of Alaska, "where rocky ledges occur, are especially frequented by them, as the crevices among the rocks give them welcome shelter. During summer they fare sumptuously upon the breeding waterfowl, eggs, and young birds, which are found everywhere, but in winter comes harder work, and the ground is carefully searched for stray mice, lemmings, or an occasional ptarmigan. In early spring, toward the end of March, when the seals begin to haul up on the ice and the first young are born, thousands of these foxes go out seaward and live upon the ice the rest of the season. The young seal's offal, left by hunters and from other sources, gives them more food there than the shore affords at this time." It may be added to this that Feilden, who was with the Polar expedition of Nares, *A Voyage to the Polar Sea* (London, 1878), found that in Grinnell Land these foxes subsisted in winter largely upon stores of frozen lemmings, etc., which they had hidden in crevices or rocks or had buried in the ground. The fur of this fox is very valuable, and most of all that of blue foxes of the Aleutians, where they are now to a certain extent protected, not only, but where they have been colonized upon certain islands, and are being bred and provided with food as a regular fur-raising industry. See ALASKA; and Colored Plate of CANDÆ.

The Gray Fox is a species (*Urocyon argenteus*) of the United States, which is generally separated from other foxes by cranial peculiarities, and by the fact that the tail has a concealed mane of stiff hairs. The general coat is silver-gray above and whitish on the under parts, but the chin and a patch on the nose are black, and the base of ears, patch at side of neck, collar on throat, interior surface of fore legs, and a broad band along the belly are cinnamon rufous. The size is about the same as that of the red fox, but the hair is stiffer and less admirable as a

pellet. This species is generally distributed over the United States, but in the West differs locally so much from the Eastern type that no less than five subspecies have been named. It is accustomed to life in the forests rather than in open country, and has unusual ability in tree-climbing; but it seems to be less adaptive than the red fox, and has almost disappeared from the thickly settled and much-cleared Northern and Eastern States. See Plate of FOXES AND JACKALS.

For American foxes, Richardson, *Fauna Boreali Americana* (London, 1829); Audubon and Bachman, *Quadrupeds of North America* (New York, 1851); Merriam, *Transactions of the Linnæan Society of New York*, vol. i. (New York, 1882); Burroughs, *Winter Sunshine* (New York, 1876); Cram, *Little Beasts of Field and Wood* (Boston, 1889); and general works upon Alaska and the Arctic Coast.

FOX, or MUSKWAKI. An Algonquian people, best known as confederates of the Sauk (q.v.). They were called foxes (*Kenards*) by the French, possibly because of having a Fox clan; but call themselves Muskewakiuk, 'red-earth people.' When first known they lived in central Wisconsin, having been driven from Lake Superior by the Ojibwa, whose continued inroads, together with a disastrous war with the French, finally compelled them to incorporate about 1760 with the Sauk, with whom they have ever since been so intimately connected that the two tribes are now practically one, their combined population being about 930.

FOX, THE. See VOLPONE.

FOX, CAROLINE (1819-71). An English diarist. She was born at Falmouth, of a Quaker family that for two centuries had been prominently identified with Cornwall. Her father, Robert Were Fox, was the inventor of the deflector dipping needle, and his genial qualities drew around him many famous persons of his day. Miss Fox has graphically sketched their character and conversations in her posthumous *Memoirs of Old Friends, Being Extracts from the Journals and Letters of Caroline Fox* (1882). Especially interesting are the accounts of the conversations between John Stuart Mill and her brother, Barclay Fox. Her portraiture is characterized by appreciativeness and sympathy, while her style is almost uniformly buoyant and entertaining.

FOX, Sir CHARLES (1810-74). An English engineer. He was born at Derby, and after serving as apprentice to Captain Ericsson, entered the service of Robert Stephenson. He was subsequently a member of the firm of Fox, Henderson & Co., and after 1857 confined himself to private practice as consulting engineer. The numerous works designed and constructed by him include the tunnel at Watford, the railroad between Camden Town and Euston Square, the bridges over the Thames, the Shannon, and the Saône at Lyons. He was one of the principal railroad builders in Great Britain, and also constructed

roads in Denmark, France, Switzerland, Canada, South Africa, and India, where he introduced the narrow gauge. The introduction of the switch in place of the sliding rail previously in use is also due to him. He also built the Crystal Palace in London.

FOX, CHARLES JAMES (1749-1806). A celebrated English statesman and orator. He was the second son of Henry Fox, first Lord Holland, and Lady Georgiana Carolina, who was the eldest daughter of the Duke of Richmond and the great-granddaughter of Charles II. He was born on January 24, 1749, was educated at Eton and Oxford, and his education was completed by two years of travel on the Continent.

On his return to England in 1768, although he was not yet of age, he was returned to Parliament through the influence of his father, beginning his career as a Tory. His talent as a debater won him a place in Lord North's Ministry, which he entered in 1770 as Junior Lord of the Admiralty. In 1773 he was made a Lord of the Treasury, but was dismissed in the following year because of his opposition to the King's favorite marriage bill and a useless humiliation inflicted upon Lord North. The years that followed may be described as a conflict between the King, through his Minister, Lord North, and the brilliant Fox. He was the most formidable opponent of the war with America, even foreseeing the necessity and advantages of a complete separation. On the downfall of Lord North in 1782, notwithstanding the King's opposition, he was made Foreign Secretary in the Whig Ministry of Rockingham. He supported Pitt's motion for Parliamentary reform, and granted to Ireland complete legislative independence. His masterful plan for the separation of French and American interests in the peace negotiations of Paris was circumvented by Shelburne, the Home Secretary. As a consequence he resigned his office when Shelburne became Premier on the death of Rockingham. Forming a coalition with Lord North and the Tories, he defeated Shelburne and resumed his old position as Foreign Secretary, but the personal influence of the King secured the rejection by the Lords of his East India bill, which vested the government of India in a commission appointed by Parliament.

What may be called the second period of the Parliamentary career of Fox was occupied by his long struggle with Pitt. He alone, of all the famous English statesmen of his day, favored the French Revolution, and was opposed to the ruinous wars with France. The total abolition of the slave trade, the removal of the political disabilities of both the Dissenters and the Catholics, were repeatedly urged by him. He gave powerful aid in the impeachment of Warren Hastings, and in 1792 he secured the passage of his Libel Act, which as a measure for personal liberty is second only to the Habeas Corpus Act in importance. When Pitt died (1806), Fox became Foreign Secretary in the Ministry of All the Talents; but he did not live to see either the slave trade abolished or his peace negotiations with France carried out. He died in his fifty-eighth year, on September 13, 1806.

Fox was better qualified to lead an opposition than to govern an empire, for he lacked the tact and self-restraint necessary for managing Parliamentary majorities and conciliating a headstrong

king. He was one of the most brilliant and interesting figures of the eighteenth century. He had the vices of his day, but these were counterbalanced by his unfailing honesty and genial and kindly disposition. His vices he owed in a large measure to his father, a notoriously corrupt politician who deliberately made of him a gamester. He did not allow the faults of his private life to interfere with the strict performance of his Parliamentary duties, and whenever he was in office he relinquished them altogether. He was a man of fine literary taste, and among his friends were the poet Rogers, Gibbon the historian, and Dr. Johnson. Of his own literary efforts, the most important was a *History of the Reign of James II.* (1808), left incomplete at the time of his death. The work is of little value from either a scientific or a literary standpoint.

Consult: Wright, *Speeches of the Rt. Hon. Charles J. Fox in the House of Commons* (London, 1815); *Memorials and Correspondence of Charles James Fox*, edited by Lord John Russell (London, 1853), being materials collected by Lord Holland, his favorite nephew; Lord John Russell, *The Life of C. J. Fox* (London, 1859-66); Walpole, *Recollections of the Life of Fox* (London, 1806); Trevelyan, *Early History of Charles James Fox* (New York, 1881); Trotter, *Memoir of the Latter Years of Fox* (Baltimore, 1812); Wakeman, *Life of Charles James Fox* (London, 1890), in the Statesmen Series; Lecky, *History of England in the Eighteenth Century*, vols. iii.-vi. (London, 1882-87).

FOX, EDWARD, Bishop of Hereford (1496-1538). An English ecclesiastic, born at Dursley, Gloucestershire, and educated at Eton and at King's College, Cambridge. He became secretary to Wolsey, who sent him as an envoy to Rome (1528), for the purpose of gaining Papal sanction to Henry VIII.'s first marriage. Brought thus into royal notice, Fox was sent upon numerous diplomatic errands to France and elsewhere, and rose rapidly in his profession till he became Bishop of Hereford (1535). He was the main mover in Henry's divorce of Catharine and marriage with Anne Boleyn, and was regarded as a pillar of the Lutheran faith. He is credited with the epigram, "The surest way to peace is a constant preparedness for war," and his most important work is *De Vera Differentia Regiæ Potestatis et Ecclesiæ* (1534), of which an English translation was made in 1548.

FOX, GEORGE (1624-91). The founder of the Society of Friends, or Quakers. He was born at Fenny-Drayton, Leicestershire, July, 1624. His parents were in good circumstances, but it is doubtful if he had any schooling. He was apprenticed to a shoemaker; but when about nineteen came to believe himself the subject of a special divine call and took to wandering in solitude through the country, absorbed in religious reveries. His friends induced him to return home; but he stayed only a short time, and finally adopted the career of an itinerant religious reformer. About 1646 he left off attending church for worship. His first efforts at preaching were made at Dukinfield, Cheshire, in 1647, and at Manchester. He first attracted general attention in 1649, by rising in the principal church at Nottingham during the sermon and rebuking the preacher for declaring the authority of the Scriptures to be the source of

divine truth. "No," cried Fox, "it is not the Scriptures; it is the Spirit of God." This audacious act led to his immediate imprisonment. On his release he repeated his protests elsewhere. The excitement caused was very great, and Fox was frequently imprisoned as a disturber of the peace. He gained followers, who first received the name Quakers in 1650. According to Fox's *Journal*, it was given by Justice Bennet, of Derby, because Fox had bidden the magistrates to "tremble at the word of the Lord." In 1655 he was examined in London before Cromwell, who pronounced his doctrines and character irreproachable. Nevertheless he had a hard struggle, was constantly vilified, and frequently imprisoned by country magistrates. His followers increased in large numbers. They were naturally visionaries, mystics, and fanatics, and their extravagances did much to bring the body and its founder into discredit. It is no small item in Fox's favor that he succeeded in moderating their excesses and introducing discipline and organization among them. He had much help from Margaret, widow of Judge Fell, of Swarthmoor Hall, Lancashire, whose house became the headquarters of the Quaker movement. Although ten years older than Fox, they were married in 1669. Fox traveled unremittingly, preaching his doctrines. In 1671-72 he visited the West Indies and the continent of North America, and twice he went to Holland. Of his many imprisonments, the longest was at Lancaster and Scarborough, in 1663-66, and the last in Worcester jail, for nearly fourteen months, in 1673-74. He died in London, January 13, 1691. Fox was not a man of broad and philosophic genius, and his writings are marked by a poverty of intellect and sentiment. He won his success by earnestness and persistence, continually insisting upon a few leading doctrines, such as the futility of learning for the work of the ministry, the presence of Christ in the heart as the 'inner light,' the necessity of trying opinions and religions by the Holy Spirit, and not by the Scriptures, and the doctrine of 'non-resistance.' He was a man of winning personal manners and strong and sound moral nature. His peculiarities of dress have been exaggerated, and were adopted from a desire for simplicity rather than eccentricity. The fullest collection of his writings is the Philadelphia edition, in eight volumes (1831). The best known is his *Journal* (1634; new ed. 1902). Consult: Tallack, *George Fox, the Friends, and the Early Baptists* (London, 1868); Bickley, *George Fox and the Early Quakers* (London, 1884); Smith, *Descriptive Catalogue of Friends' Books* (London, 1867); Beck, Wells, and Chalkley, *Biographical Catalogue* (London, 1888). There are many biographies, among which those of Marsh (London, 1847), Jenney (Philadelphia, 1853), and Watson (London, 1860) may be mentioned. See FRIENDS.

FOX, GEORGE L. (1825-77). An American comedian, born in Boston. He made his first appearance at the Tremont Street Theatre, in that city, at the age of five. Soon after his arrival in New York, where he played for some time at the National Theatre in Chatham Street, he became popular as a low comedian. In the Civil War he served as a lieutenant in the Eighth New York Infantry. Inspired by the famous Ravel Brothers to undertake pantomime, he created a

distinct place for that kind of entertainment in New York City, first at the National Theatre and later at the New Bowery, of which he was for a time lessee and manager. His principal rôle was that of the clown in *Humpty Dumpty*, and no one has ever equaled him in this character, which he may be said to have created. He was scarcely less distinguished in his burlesques on the famous tragedians of the day, and his resemblance to Booth in the character of Hamlet was remarkable.

FOX, GUSTAVUS VASA (1821-83). An American naval officer. He was born in Saugus, Mass., entered the United States Navy as a midshipman in 1838, served eighteen years, participating in the war with Mexico, and retired with the rank of a lieutenant in 1856. He was engaged in the wool-manufacturing business at Lawrence, Mass., from 1856 to 1861. Early in the latter year he was consulted by General Scott in regard to sending a relief expedition to Fort Sumter, and an expedition was actually planned; but President Buchanan refused to allow the plan to be carried out. After the inauguration of Lincoln, however, it was put into operation. Fox was first sent to confer with Major Anderson, and upon his return was commissioned to fit out a relief expedition at New York. Fox, with part of his ships, arrived off Charleston Harbor on the morning of the bombardment; but through an order which had detached the principal vessel of his fleet and sent it to Fort Pickens, he found himself unable to render aid. On his return North, Fox was appointed Assistant Secretary of the Navy, a position which he held throughout the war. To him is to be credited the plan for opening up the Mississippi, for the capture of New Orleans, and the selection of Farragut for high command. In 1866 he was sent to Russia on a special congratulatory mission to the Czar, Alexander II., who had just escaped assassination. While in Saint Petersburg he took part in the negotiations which resulted in the purchase of Alaska. Upon his return to America he again entered the wool-manufacturing business at Lowell, from which he had retired on the outbreak of the war. Consult Loubet, *Narrative of Fox's Mission to Russia in 1866* (New York, 1873).

FOX, HENRY, Baron HOLLAND (1705-74). See HOLLAND, HENRY FOX.

FOX, HENRY EDWARD (1755-1811). An English soldier, the younger brother of Charles James Fox. After a brief education at Westminster School, he entered the King's Dragoons in 1770. Three years later he was made lieutenant of the Thirty-eighth, quartered in Boston. He served at Concord, Bunker Hill, Long Island, White Plains, Brandywine, and Philadelphia, and in 1777 was made major and a year later lieutenant-colonel of the Forty-ninth Regiment, and with it saw service in the West Indies. In 1783 he returned to England, and was made aide-de-camp by the King, who took a great fancy to him. Major-general in 1793, he commanded a brigade at Roubaix and Mouveaux, and at Pont-à-Chin (1794) beat back a French army. In 1801 he was sent to Minorca, and stayed there until 1803, when he went to Ireland as commander-in-chief, and was badly frightened by the feeble rebellion under Emmet. In the next year he was made Lieutenant-Governor and actual commander of Gibraltar, and in 1806, on the accession of the

Ministry of All the Talents, was appointed Ambassador to Naples and commander of the forces in Sicily; but he accomplished little there, because of the quarrel with the Neapolitan Court which grew out of his unwillingness to risk all in an attempt to drive the French out immediately. In 1807 he was recalled by the new Ministry, after his brother's death, and subsequently was made general (1808) and Governor of Portsmouth (1811). He married Marianne Clayton (1786), and had two daughters and one son, Henry Stephen (1791-1846), who was Minister to the United States (1835), and did much to promote the success of the Ashburton Treaty.

FOX, JOHN (1863-). An American novelist, noteworthy for vivid description of life in Kentucky, his native State, of whose mountain dialect he is master. He was born in Bourbon County, Ky., in 1863, and was graduated from Harvard in 1883. After some experience in journalism, he traveled in Southern States and California, and afterwards engaged in business at Cumberland Gap, where he had ample opportunity for the study of mountain life. He wrote: *A Mountain Europa; A Cumberland Vendetta* (1895); *The Kentuckians*; *Crittenden* (1900), a novel of the Cuban War; and *The Little Shepherd of Kingdom Come*; also two volumes of short stories—*Hell fer Sartain, and Other Stories* (1897), and *Blue Grass and Rhododendron* (1901).

FOX, LUKE (1586-1635). An English navigator. He was born at Hull, and went to sea at an early age. On April 30, 1631, he sailed from London to search for a northwest passage. The results of his explorations were subsequently embodied in the work entitled *Northwest Fox*; or, *Fox from the Northwest Passage* (1635), a work which contained a most interesting map of the Arctic regions as then known. He made an extensive exploration of the western shore of the land now named after his predecessor, Baffin, and discovered Cumberland Island and other points along Hudson Strait. The far northern channel through which he passed has been named after him.

FOX, MARGARET (1836-93). An American spiritualist, born at Bath, Canada. At Hydeville, Wayne County, N. Y., about 1848, there were heard in the Fox residence rapping noises which appeared to proceed from the walls and furniture. Margaret and her two sisters, Catharine and Leah, discovered that by means of a given code communication could be established with the presumably supernatural agency by which the raps were produced. The sisters gave public sances in America and Europe, the chief features of which were the spirit rappings and the moving of large bodies by invisible means. So-called 'mediums' became numerous, and the investigation of spiritualistic phenomena interested many. From the first, however, scientific minds discredited the claims of the sisters. In 1888 Margaret made a confession of imposture, later retracted. See SPIRITUALISM.

FOX, RICHARD. See FOXE.

FOX, WILLIAM JOHNSON (1786-1864). An English Unitarian preacher, orator, and political writer. The son of a peasant farmer, he was born at Uggeshall Farm, Wrentham, Suffolk, March 1, 1786. His father removed to Norwich, where he pursued various callings, and Fox, after

primary education at a chapel school, and working as an errand boy and weaver's help, became a banker's clerk. He devoted his leisure to self-improvement in arts and languages, and presently was sent to Homerton Independent College for ministerial training. He subsequently seceded to Unitarianism, and in a London charge became celebrated as a rhetorician and the most eloquent exponent of English rationalism. An unfortunate marriage and separation led to his resignation from the ministry, and he devoted himself to literature and public speaking. In the interests of free trade and the Anti-Corn Law League he thrilled enthusiastic popular audiences with his oratory. From 1847 to 1863 he represented Oldham in Parliament, as an advanced Liberal. His speeches in that critical assembly did not equal the success of his platform orations; but he soon acquired general respect by his tact and discretion. His best Parliamentary addresses were in favor of public education and the extension of the franchise. He was the first contributor to *The Westminster Review*, he was editor of *The Monthly Repository* for many years, and he contributed copiously to other organs of public opinion. His *Lectures of a Norwich Weaver Boy* and *Lectures to the Working Classes* had an extensive and popular circulation, and did much to effect the reforms they advocated. *Religious Ideas* is his most important theological work. His voluminous writings, sermons, and orations are collected in the memorial edition of his works (London, 1865-68). He died June 3, 1864.

FOX-BAT. Any large fruit-eating bat, or 'flying fox,' of the family Pteropodidae, esteemed the lowest in rank of the Chiroptera. There are some seventy species, inhabiting Africa, India, China, Japan, and the Malay Archipelago, where they especially abound. Most are of large size, are tailless, have small, pointed ears, large eyes, noses free of lobes, and those of the type-genus much resemble in physiognomy, size, and color the foxes after which they are named. A Javan species spreads its wings five feet, and is eaten by the natives. These bats are wholly frugivorous, nocturnal, gregarious, and do great damage where numerous, especially to cocoanut and mango plantations. A strong musky odor pervades, at night, the vicinity of their assemblies, and one credible writer asserts that the flying foxes are fond of drinking palm toddy from the chatties left out overnight. An African genus of this family supplies the common Egyptian bat, which flocks in the chambers of the pyramids and other tombs, and is figured on the monuments; it is *Xantharhia Egyptiaca*. An Austro-Malayan genus is termed Harpia, in reference to the supposition that a bat of this sort is the basis for the harpies of classic mythology. Consult Wallace, *Malay Archipelago* (New York, 1869). See FRUIT-BAT.

FOX CHANNEL. A northern reach of Hudson Bay, Canada, inclosed on the west by Southampton Island and Melville Peninsula, and on the east by Fox Land and Baffin Land (Map: Canada, P 3). It has a southeast outlet through Hudson Strait, and a northwest outlet through Fury and Hecla Strait. It was named after Luke Fox, who explored Hudson Bay in 1631.

FOX DEITY AND FOX-POSSESSIONS. In Chinese Asia, popular belief ascribes to the fox

extraordinary powers, and the ability to assume human or any shape, but generally that of beautiful women, and to work all kinds of mischief, especially in love affairs. Possession by the spirit of a fox is so thoroughly believed in that a standard source of revenue for Buddhist priests of certain sects is in practicing exorcism from their suffering patients, usually women. The foxes in their various transformations appear to the good or evil with rewards or punishments in quite the orthodox story-book style. In Japan the fox is the attendant on the food god, Inari (Rice-bearer, or Rice-man), and myriads of effigies of the creature in white or colored material, usually stone, may be seen near the Inari shrines. Giles tells us that "in some parts of China it is customary for mandarins to keep their seals of office in what is called a 'fox chamber'; but the character for fox is never written, the sight of it being supposed to be very irritating to the live animal. A character which has the same sound is substituted, and even that is divided into its component parts, so as to avoid the slightest risk of offense. This device is often adopted for the inscriptions on shrines erected in honor of the fox." Consult: Pfoundes, *Fu-So Mimi Bukoro* (Yokohama, 1875); Mitford, *Tales of Old Japan* (London, 1876); Chamberlain, *Things Japanese* (London, 1892); Griffiths, *The Mikado's Empire* (New York, 1900).

FOX-DOG. A book name for a group of small South American canine animals, on account of their somewhat fox-like aspect. The group was defined by Mivart, *Proceedings of the Zoological Society of London* (London, 1890), as including five species, as follows:

Crab-eating fox-dog (*Canis cancrivorus*), Brazil.

Short-eared fox-dog (*Canis microtis*), Brazil.

Azara's fox-dog (*Canis Azaræ*), Brazil to Tierra del Fuego.

Small-toothed fox-dog (*Canis parvidens*).

Black-tailed fox-dog (*Canis urostrictus*), Brazil.

These animals are much alike in their foxy appearance, though rather larger in size, and having a more variegated and highly variable coat, often handsomely marked with black and dark red, than any true fox. The crab-eating fox-dog is common throughout the forested parts of the whole Amazon basin, and gets its name from its fondness for crayfish, though these crustaceans form only a part of its fare. They often collect in packs and run down deer. Azara's dog (see Plate of WOLVES AND WILD DOGS) is known throughout the whole continent east of the Andes, on the pampas and bleak shores of Patagonia (where it is called colpeo), as well as in the forests of Brazil and Guiana. It has much the habits of the North American coyote, but resorts to jungles and forests much more readily. Everywhere it is fox-like in its fondness for poultry, and in Paraguay it is said to destroy a great amount of sugar-cane while eating only a little. The small-toothed species takes its name from the diminutive size of the fourth premolar, and of the short-eared dog almost nothing is known. Consult Hudson, *The Naturalist on the La Plata* (London, 1892).

FOXGLOVE. The very inappropriate name of a genus (*Digitalis*) of about 18 species of beautiful half-hardy herbaceous biennial plants of the order Scrophulariaceæ. The erect stems,

which bear numerous large leaves at their bases, terminate in long racemes of inflated campanulate flowers, of various colors and markings. Individually foxgloves are attractive, and

FOXGLOVE.
(*Digitalis Purpurea*.)

in masses they give character to the flower border. They succeed well in light, rich soil, not too dry in either exposed light or in partial shade. When once established, they will reproduce sufficient plants from seed to keep the border stocked. One species, credited with diuretic, sedative, and narcotic properties, is officially listed in dispensaries under the name *Digitalis* (q.v.).

FOXGLOVE, JOHN (1516-87). The English martyr-ologist. He was born in 1516, at Boston, Lincolnshire. In 1523 he entered as a student at Oxford; in 1537 he took his bachelor's, and in 1543 his master's degree, and was elected a full fellow of Magdalen College (1539). He displayed at an early period an inclination for Latin poetry, and wrote several plays in that language upon scriptural subjects. Of these, the only one that remains, entitled *De Christo Triumphante*, was first printed at Basel in 1556. The religious movements of the times led him to study the great controversy between the Old Church and Protestantism, and becoming a convert to the principles of the Reformation, on July 22, 1545, he resigned his fellowship. In 1546 he married, and coming to London for employment, he attracted the notice of the Duchess of Richmond, and through her influence became tutor (1548) to the children of her brother, the Earl of Surrey, then a State prisoner in the Tower. On June 23, 1550, he was ordained deacon by Ridley, Bishop of London, and preached the doctrines of the

Reformation at Reigate. In 1553, when Mary came to the throne, he was dismissed by the Catholic grandfather of his pupils, and fearing persecution for his religious opinions, he fled to the Continent. On the accession of Elizabeth, he returned to England in October, 1559; was ordained priest 1560, and in May, 1563, he was made a prebendary in Salisbury Cathedral and Vicar of Shipton. He also held the living of Cripplegate, which he soon resigned, and for a year (1572-73) he held a stall at Durham. In 1575, when some Dutch Anabaptists were condemned to the flames in London, Foxe interceded for them with Elizabeth and other persons in authority, but without effect. He wrote numerous controversial and other works, but the one that has immortalized his name is his *History of the Acts and Monuments of the Church*, popularly known as *Foxe's Book of Martyrs*, the first draft of which was published at Strassburg in 1554. The first English edition appeared in 1563. Sanctioned by the bishops, it was ordered, by a canon of the Anglican convocation, to be placed in every cathedral church in England, and has gone through innumerable editions. It is not a critical work, as might be supposed, and Roman Catholics deny its trustworthiness. The best editions are by Cattle, with introduction by Townsend (London, 1843-49); Mendham and Pratt (8 vols., ib., 1853); and by Stoughton (London, 1877). Foxe died in London, April, 1587, and was buried in the chancel of Saint Giles's, Cripplegate, London. There is no satisfactory life of Foxe; the first issued (1641) was very unreliable; the nearest approach to correctness is that revised by Pratt (London, 1870).

FOXES, or FOX, RICHARD (c.1448-1528). An English prelate and statesman, born at Ropesley and educated at Oxford. He left Oxford because of the plague, and studied for a short time at Cambridge, and then went to Paris. There he made the acquaintance of Henry of Richmond, and helped him get money and men from the French King for his invasion of England. After the accession of Henry VII., Foxe was one of the King's most trusted advisers, and became Secretary of State, Privy Seal, and Bishop of Exeter. He was sent to Scotland as Ambassador several times, negotiated a treaty between England and Scotland in 1487, and again in 1497, after a stout defense of his castle in Durham. In the interval he had been a signer of the Treaty of Etaples (1492), and commissioner on the *Intercursus Magnus*, a treaty with Philip of Austria (1496). In 1498 and 1499 he treated with the Scotch King, and made arrangements for his marriage with the Princess Margaret. In the following year he was chosen Chancellor of Cambridge, and was Master of Pembroke (1507-19). Under Henry VIII. his political influence gradually diminished. He retired from the Court in 1516, and became blind a few years after. But his last years were spent well; he founded free schools at Taunton and Grantham, and at Oxford. Corpus Christi College (1516). The story that Wolsey urged him to resign his bishopric to him, and that Foxe refused, has little authority. Foxe may have had a share in the writing of *Contemplacyon of Synners* (1499). He edited a *Processional* (1508); and translated the *Rule of Saint Benedict* (1517).

FOXHOUND. A small hound, trained to the pursuit of the fox. See HOUND; FOX-HUNTING.

FOX-HUNTING. There are various fashions of hunting the fox. In England, the home of fox-hunting, he is pursued by carefully bred packs of hounds ranging in number from twenty-five to forty couples, who are put by the huntsmen into a covert or wood, where it is known, or thought, the fox has his earth. He would elude the hounds almost invariably were it not for the scent left in the air along his track. One or another hound is sure to come across the scent, and give tongue, so that the remainder of the pack quickly follow. They break cover, and are joined outside by the horsemen who follow the chase. The fox will, as a rule, go down wind, and make straight for some spot where he can baffle the hounds by getting under cover, or into an earth where they cannot follow him. Sometimes he throws the dogs off his scent by a subterfuge, and again he arrives at his earth only to find that it has been filled up by the 'stopper,' and he has to make off on another venture. Sometimes he is killed in the open. The kenneling and maintenance of hounds and huntsmen and the establishments kept up in the most favored neighborhoods necessitate an immense expenditure annually. The most important hunts in England are the Belvoir Castle, the Quorn, the Pytchley, and the Cottesmores. Leicestershire also is a favorite hunting county, but the sport is practically general throughout England, and in a lesser degree in Ireland. In America, the Virginian colonists early followed the English method of fox-hunting, with the difference only that the pack was made up by each gentleman bringing his own hounds with him. The sport was common in the Southern States up to the time of the Civil War, and there are still sections where it is conducted much as in the old days. In Maryland the English foxhound was crossed with the Irish stag-hound to give him the necessary endurance for more difficult conditions; and the records of fox-hunting in Queen Anne County go back to 1650. Dissatisfied with the gray native fox, the colonists in 1738 imported red foxes, and let them loose along the shores of the Chesapeake. They multiplied rapidly, and the Baltimore Hounds, established in 1818, have always been among the most famous in the South. The English pack has been discarded, and the Magnes strain, a distinctly Maryland dog, adopted by the Elkridge Club, the most prominent in Maryland. Pennsylvania had the first organization, the Gloucester Fox-Hunting Club, established in 1766. The American hound is faster and better than the English dog, and peculiarly well adapted for his work. In America, a 'kill' is an exception with the average hunt. 'Earths,' as the holes in the ground are called, are never 'stopped' or closed as in an English fox-hunting country, and it is very rarely that an attempt is made to dig out a fox who has taken refuge in one. Particularly is this true where the fox has made a straight, true race. Occasionally it happens that a fox becomes known, and is given a name, owing to the frequent sport he has afforded the hunt, and his exceptional skill in always making his escape. Where foxes are not found, or it is desirable to spare the cubs, drag-hunting is a very fa-

vorite sport as well as an excellent training for young horses, dogs, or riders. A course from point to point is mapped out, and a good rider, well mounted, is sent over it dragging on the ground as he goes a bag of aniseed, or a red herring. The hounds are cast off, and pick up the scent with as much avidity and certainty as if it were that of a fox. The riders follow the hounds on horseback, and if the pace of the hounds is good, and the course suitable, a very effective and exhilarating ride is the result. The chronicles of drag-hunting go back to the reign of Charles II., further back in fact than the existence of any of the great foxhound packs today, and its practice has continued ever since. (See HORSE; HORSEMANSHIP; HUNTING.) Consult Paget, *Hunting* (London, 1900).

FOX-HUNTING, in law. As one of the national sports of Great Britain, fox-hunting is the subject not only of social usages, but of legal rules. Persons who kill foxes by traps or guns are visited with social ostracism; while those who hunt them with horses and hounds are exempted by statute from penalties for trespass within lands of others in certain cases. A master of hounds, as well as one who follows hounds in fox-hunting, is generally answerable civilly, however, for damage done to the property of others. A fox is not the subject of absolute ownership until killed or reduced into possession, and therefore not the subject of larceny. A person may acquire a qualified property, however, in tame foxes, and for injuries done by such animals he should be held liable, as for those inflicted by other *fera nature* (q.v.).

Until recently the legal status of the fox in this country has been that of a noxious wild animal, liable to killing at sight by trap, gun, or dog. With the introduction of fox-breeding and fox-hunting upon large private estates has come a change in legal policy, and statutes have been enacted prohibiting the killing of foxes during certain months. Laws against cruelty to animals have been invoked to prevent the hunting of captive foxes by dogs. Consult: *Commonwealth vs. Turner* (145 Mass. 296, 1887); *New York Session Laws* (1901, ch. 559); *Oke, Handy Book of the Game Laws* (4th ed., London, 1897).

FOX ISLANDS. Another name for the Aleutian Islands (q.v.).

FOX RIVER. A river of Wisconsin, rising in the southern part of the State, in Green Lake County (Map: Wisconsin, E 4). It flows first in a southwesterly direction to within a few miles of the town of Portage, on the Wisconsin River, with which it is connected by a ship canal. At this point the Fox turns abruptly to the northeast, and pursues a circuitous course through the State to Lake Winnebago, through which it passes, connecting that body of water with Green Bay, an arm of Lake Michigan. It is sometimes known by the Indian name of Neenah. It is navigable for a considerable part of its course, and, through the medium of the canal connecting it with the Wisconsin, forms a link between the navigation systems of the Mississippi and the Great Lakes. The lower part of the Fox is marked by numerous rapids, furnishing great water-power. Its total length is over 250 miles.

FOX-SHARK. See THRESH-SHARK.

FOX-SNAKE (so called from its color). An American harmless snake (*Coluber vulpinus*) inhabiting only the northern part of the Mississippi Valley. It reaches six feet or more in length, is robust, and although harmless, is easily irritated and then shows more pugnacity and courage than almost any other of its tribe. It feeds altogether upon small mammals, up to the size of a half-grown rabbit, and does farmers much service by killing great numbers of mice. Its color above is light brown, blotched on the back with chocolate, each blotch covering a space three or four scales long and bordered with black. Smaller and rounder blotches mark the sides and yellowish abdomen. It is locally known, also, as the pilot-snake, very likely by vague confusion with the copperhead. Consult Hay, *Seventeenth Annual Report, State Geologist of Indiana* (Indianapolis, 1892).

FOX-SPARROW (so called on account of its color). One of the largest and handsomest of North American sparrows (*Passerella iliaca*), distinguished by the rust-red of its plumage; purest and brightest on the rump, tail, and wings, and elsewhere on the upper parts appearing as streaks on an ashy ground; below it is white thickly marked with rust-red. It is a migrant, passing to northern Canada to breed, and favoring us on its passage in early spring with a loud and sprightly song, more like that of a thrush than a sparrow. It makes its nest on the ground, in the protection of thickets, and lays thickly spotted eggs.

FOX-SQUIRREL (so called on account of its color). The large rufous squirrel of the Mississippi Valley. See SQUIRREL.

FOXTAIL GRASS. A name applied to two very dissimilar grasses of the genera *Alopecurus* and *Chaetochloa*, or *Setaria*, as it is better known. They bear a general resemblance to timothy, with which they are closely related. The species, which number about twenty, are natives of temperate countries of both the Northern and Southern Hemispheres, and several are American. Meadow foxtail grass (*Alopecurus pratensis*), which has an erect smooth culm about one and one-half to two and one-half feet high, and a cylindrical, obtuse, spike-like panicle abundantly covered with silvery hairs, is one of the best meadow and pasture grasses in Europe, and introduced into America. It does not arrive at full perfection till the third year after it is sown. It bears mowing well, and upon good soils yields a large crop, and is reckoned a good grass for lawns. It is very hardy, and bears drought well. The jointed foxtail, or water-foxtail (*Alopecurus geniculatus*), with an ascending culm bent at the joints, is very common in moist places, and cattle are fond of it, but it is a small grass growing but a foot or two high. The slender foxtail grass (*Alopecurus agrestis*) is an annual or biennial, of little value except for light sandy soils, on which it is sometimes sown. *Alopecurus occidentalis* is a native of the United States, and would doubtless prove valuable in the Rocky Mountain region and elsewhere. These grasses are all valuable, but should be sown in mixtures.

The other class of foxtail grass belongs to the genus *Setaria*. Other generic names have been given them, but these will suffice. They are

mostly considered as weeds and are more or less troublesome, although when young they are eaten by stock, and the seeds of some are gathered. There are about thirty-five species, some of them exceedingly valuable. They are distributed throughout all warmer and temperate regions. The Hungarian grass or millet (*Setaria italica*), with its varieties, is extensively cultivated for its forage and seed. The latter is employed as human food in some countries, as in India, Russia, etc. The giant millet (*Setaria magna*) grows in wet places from Delaware to Florida. The common species of yellow foxtail (*Setaria glauca*), green foxtail (*Setaria viridis*), and bristly foxtail (*Setaria verticillata*), are weeds that are more or less abundant in fields and gardens of nearly all temperate countries. *Hordeum murinum* is called foxtail grass in California and elsewhere.

FOX-TERRIER. A terrier, usually white with black or tan markings, originally used for unearthing foxes, but now principally as a pet. See **TERRIER**.

FOY, fwä, MAXIMILIEN SÉBASTIEN (1775-1825). A distinguished French general and orator. He was born at Ham, in the Department of Somme, February 3, 1775. He was one of the volunteers of 1791, and during the next nine years served with distinction under Dumouriez, Moreau, Schoenbourg, and Masséna. In 1800 he was made adjutant-general in the Army of the Rhine, which marched through Switzerland into Italy, where he commanded the vanguard of the army in 1801. In 1805 he served under Marmont in the Austrian campaign. Two years later Napoleon sent him to Turkey at the head of 1200 artillerymen to assist Sultan Selim against the Russians and British. Under the direction of the French Ambassador, General Sébastiani, Foy defended Constantinople and the Strait of the Dardanelles, forcing Duckworth, the daring British admiral, to retire with loss. After 1808 he fought in the Peninsula, at first under Junot, and then as general of division under Soult and Masséna. He distinguished himself in the retreat into France, and was severely wounded at Orthez. In the campaign of 1815 he commanded a division on the field of Waterloo, where he was wounded for the fifteenth time. In 1819 he was elected Deputy by the Department of Aisne. In the Chamber he was the constant advocate of constitutional liberty, and showed great rhetorical talent and knowledge of political economy. He distinguished himself particularly by his eloquence in opposing the invasion of Spain in 1823. Mme. Foy published in 1827, from her husband's papers, *Histoire de la guerre de la péninsule*. In the previous year appeared his *Discours* with a biography.

FOYATIER, fwä'yä'tyÄ', DENIS (1793-1863). A French sculptor, born at Bussière (La Grande), Loire. First instructed by Marin at Lyons, he studied afterwards under Lemot, and from 1817 at the Ecole des Beaux-Arts in Paris. For the statue of a "Faun" he was awarded the gold medal in 1819, and thenceforward executed numerous commissions for public buildings and churches in Paris and other cities. His more noteworthy works include a statue of "Saint Mark," in the Cathedral at Arras; "Wisdom" (1831), in the Chamber of Deputies, Paris; "Astydamas and Lucilia" (1833); "Faith," in Notre Dame de Lorette,

Paris; "Figures of Apostles," in the Madeleine, Paris; the great "Frieze in Relief," on the Arc de l'Etoile, Paris, one of his most admired productions; and the "Equestrian Statue of Jeanne d'Arc" (1855), at Orleans.

FOYER, fwä'yä' (Fr., hearth). The lobby of a theatre, or large saloon in a theatre, in which the *personnel* of the theatre or the audience may promenade between the acts. It is almost always over the entrance hall. In some of the most recently erected French theatres there are two foyers, one over the other, for the accommodation of the different classes who occupy the dress circle and the upper galleries. The most magnificently decorated foyer in the world is that of the Grand Opera House in Paris.

FOYLE, foil, LOUGH. An inlet of the Atlantic, on the north coast of Ireland, between the counties of Londonderry and Donegal. It is 16 miles long, one mile wide at its entrance, and nine miles wide along its south side (Map: Ireland, D 1). A great part of it is dry at low water. The west side alone is navigable for vessels of 600 tons, which ascend its chief tributary, the Foyle, to Londonderry. The River Foyle, formed by the confluence of the Mourne and Finn at Lifford, flows 14 miles northeast to the lough. It has salmon fisheries.

FRAAS, fräs, KARL NIKOLAUS (1810-75). A German writer on agriculture. He was born at Rattelsdorf, Upper Franconia, and was educated at Munich. He was for several years professor of botany at the University of Athens, where he was also director for a time of the Royal Gardens and of the Royal School of Arboriculture. He was professor of agriculture at the University of Munich from 1847 to 1853, when he became director of the Institute of Veterinary Surgery in that city, which he thoroughly reorganized. He was chief secretary of the Bavarian Agricultural Society, and in association with Liebig conducted the agricultural experiment station organized by that society. Probably no other man of his time did so much to modernize agricultural methods in Bavaria, and his efforts in behalf of fish hatcheries were scarcely less noteworthy. His works include: *Die Schule des Landbaues* (5th ed. 1871); *Die künstliche Fischerzeugung* (2d ed. 1854); *Geschichte der Landbau- und Fortswissenschaft seit dem 16ten Jahrhundert* (1866); *Das Wurzelleben der Naturpflanzen* (2d ed. 1872).

FRAAS, OSKAR (1824-97). A German geologist, born at Lorch. After holding pastorates in various parts of Germany he was successively appointed custodian of the Royal Cabinet of Natural History at Stuttgart (1854), and professor of geology (1856). Already as a student he had received a prize for a geognostic chart of Tübingen, and in 1859 he was engaged with Deffner in preparing a similar chart of Württemberg. In 1866 he made important archaeological discoveries at Schussenried, Württemberg, and in 1875, on behalf of Rustem Pasha, he made the first geological survey of the Lebanon, described by him in the publications entitled *Drei Monate am Libanon* (2d ed. 1876), and *Geologische Beobachtungen am Libanon* (1878). Among his other works are: *Vor der Sündflut: Eine populäre Geschichte der Urwelt* (3d ed. 1870); *Geognostische*

Beschreibung von Württemberg, Baden und Hohenzollern (1882).

FRACASSE, frä'käs'. See CAPITAINE FRACASSE.

FRACASTORO, frä'käs-tō'rō, GIBOLAMO (1483-1553). An Italian poet and physician, born of an ancient family at Verona. At the age of nineteen he was appointed professor of logic in the University of Padua. On account of his eminence in the practice of medicine, he was elected physician of the Council of Trent. His Latin verse also exhibits remarkable elegance. A bronze statue was erected in his honor by the citizens of Padua, while his native city commemorated their great compatriot by a marble statue. His writings in prose and verse are numerous. The chief among them are: *Syphilis, sive Morbi Gallici* (1530); *De Vini Temperatura* (1534); *Homocentricorum sive de Stellis, de Causis Criticorum Dierum Libellus* (1535); *De Sympathia et Antipathia Rerum, De Contagionibus et Contagiosis Morbis, et eorum Curatione* (1546). The collected works of Fracastoro appeared for the first time in 1555.

FRACTION (Fr., OF. *fraction*, Lat. *fractio*, from *frangere*, to break; connected with Goth. *brikan*, OHG. *brehhan*, Ger. *brechen*, AS. *brecan*, Eng. *break*, and possibly with Gk. *ῥήγναι*, *rhēgnynai*, to break, OIr. *conboing*, breaks). A fraction is commonly defined in arithmetic as one or more of the equal parts of a unit or quantity. This definition, however, is not sufficient for expressions like $\frac{2}{-3}$, $\sqrt{\frac{3}{2}}$ since "2 of the — 3 equal parts of unity," or "one $\sqrt{2}$ th of 3," is meaningless. Hence, in general, the symbol $\frac{a}{b}$, in which b is not zero, is regarded as denoting the division a by b .

A fraction is said to be irreducible, or to be in its lowest terms, when the greatest common divisor of its terms has been suppressed. In arithmetic, a fraction whose numerator is less than its denominator is called a proper fraction. In algebra a proper fraction is one whose numerator is of less degree than its denominator. In the contrary cases the fractions are called improper. Numerical fractions of the older form, as $\frac{3}{4}$, are called common or vulgar fractions as opposed to the more recent form of 0.75, called decimal fractions. (See DECIMAL SYSTEM.) The term was originally applied to this form as opposed to the 'astronomical' or 'physical' fractions, i.e. those on the sexagesimal system. The operations with algebraic fractions are subjected to the associative, commutative, and distributive laws (q.v.); e.g.

$$\frac{a}{b} + \left(\frac{c}{d} - \frac{e}{f}\right) = \left(\frac{a}{b} + \frac{c}{d}\right) - \frac{e}{f};$$

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{c}{d} \cdot \frac{a}{b};$$

etc. Fractions of the form $\frac{a}{\frac{b}{c}}$ are called com-

plex fractions, and obey the same laws as simple fractions; e.g. the complex fraction just mentioned equals

$\frac{a}{b} + \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc}$
Complex fractions of the form

$$\frac{\frac{a}{b}}{\frac{c}{d} + \frac{e}{f}} + \dots$$

are called continued fractions. Such fractions are usually simplified to the best advantage by first multiplying the terms of the last fraction of the form

$$\frac{\frac{c}{d}}{\frac{e}{f}}$$

by the last denominator, and so working up. The theory of continued fractions, however, is extensive, and their properties are numerous. In the above fraction,

$$\frac{a}{b}, \frac{ad}{bd+c}, \frac{a(fd+e)}{b(fd+e)+fc}, \dots$$

are the simplified forms of the fraction inclusive of the first, second, and third denominator successively, and so on. These are fractions evidently converging toward the true value of the given fraction. It is proved in algebra that the difference between any two consecutive convergents is equal to 1 divided by the product of their denominators; that the value of the fraction lies between each successive pair of convergents, and hence differs from either by less than their difference; e.g.

$$\frac{6985}{2151} = 3 + \frac{482}{2151} = 3 + \frac{1}{\frac{2151}{482}}$$

$$3 + \frac{1}{4 + \frac{1}{2 + \frac{1}{6 + \frac{1}{5 + \frac{1}{7}}}}}$$

or as it may be written,

$$\frac{3}{1} + \frac{1}{4} + \frac{1}{2} + \frac{1}{6} + \frac{1}{5} + \frac{1}{7}.$$

Here the convergents are

$$3, \frac{13}{4}, \frac{29}{9}, \frac{187}{58}, \frac{964}{299}, \frac{6985}{2151}.$$

The difference between the last two convergents is $\frac{1}{299 \cdot 2151} = 0.0000016$, hence the next to the last convergent, expressed decimally, gives the value of the original fraction correct to 5 decimal places.

A fraction whose numerator is an integer and whose denominator is an integral power of 10 is called a *decimal fraction*; e.g.

$$\frac{1}{10}, \frac{1}{100}, \frac{3505}{10000}$$

are decimal fractions, although given in the form of common fractions. Such fractions admit of an abbreviated notation; e.g. 0.1, 0.01, .3505, which possesses great advantages in calculation. See also CIRCULATING DECIMALS.

In some algebraic fractions the substitution of a particular value of the letters will make both numerator and denominator vanish. Such frac-

tions are called *vanishing* fractions; e.g. the fraction $\frac{x^2-1}{x-1}$ becomes $\frac{0}{0}$ when $x = 1$. The value of a fraction which assumes the form $\frac{0}{0}$ for particular values of the letters involved is, in general, found by means of the differential calculus. But frequently that value may be found by simpler means, as in the above example

$$\frac{x^2-1}{x-1} = \frac{x-1}{x-1} \cdot (x+1) = x+1,$$

the limit of which, for $x = 1$, is $1+1 = 2$. (See LIMITS.)

Doubtless the notion of a fraction is nearly as old as the notion of number. Among the oldest treatises on fractions is the arithmetic of Ahmes (q.v.), showing how the Egyptians dealt with fractions before the year 2000 B.C. They made extensive use of unit fractions, i.e. fractions with the numerator 1. In the hieratic writing, the denominator with a point above it was the symbol for such a fraction. The first problem Ahmes solves is that of separating a fraction into unit fractions; e.g. he finds

$$\frac{2}{9} = \frac{1}{6} + \frac{1}{18}, \quad \frac{2}{95} = \frac{1}{60} + \frac{1}{380} + \frac{1}{570}.$$

The fractions of the Babylonians were sexagesimal, having at the outset a common denominator 60, and could be dealt with like whole numbers. In the written form only the numerator was given, with a special fractional sign attached. The Greeks wrote the numerator below or else before the denominator thus:

$$\frac{\kappa\alpha}{\iota\zeta}, \text{ or } \frac{\kappa\alpha'}{\iota\zeta}, \text{ or } \iota\zeta' \frac{\kappa\alpha''}{\kappa\alpha''} = \frac{17}{21}$$

The Romans made much use of the duodecimal system, and gave special names to their fractions which corresponded to

$$\frac{1}{12}, \frac{2}{12}, \dots, \frac{11}{12}.$$

To the Hindus is due the present form of the common fraction. Although the sexagesimal and duodecimal fractions prepared the way for decimal fractions, the latter did not appear in their present form until early in the seventeenth century. Among the first to use such fractions were Rudolf, Bürgi, and Stevin. The first general use of the decimal point is found in the trigonometric tables of Pitiscus (1612).

FRACTURE (Lat. *fractura*, a break, from *frangere*, to break). In surgery, the term is used of the break of a bone or of partially ossified cartilage. A fracture is said to be *simple* where the break is not open to the air; *compound* when it is so open; *single* when there is but one break; *multiple* when more than one break exists; *comminuted* when the bone is broken into many little pieces; *impacted* when one fragment of the bone is driven into the other; *complicated* when a neighboring joint or large blood-vessel is involved in the traumatism; *complete* when the whole thickness of the bone is ruptured; *incomplete* (or green-stick) when the bone is partly broken, partly bent; *intra-capsular* when the break occurs within the capsule of a joint; and *transverse*, *oblique*, *longitudinal*, or *spiral*, according to the direction and position of the break as regards the shaft of the bone.

Among the external causes of fracture are accident or violence, and excessive muscular action. The condition known as *fragilitas ossium* occurs late in life, or in early life, as a softening of the bone from disease. Cancer, syphilis, scurvy, and rickets often result in altered bone-structure. Muscular action causes rupture of *patella* or *os calcis* (heel-bone), during the endeavor to prevent falling after tripping, or in running or jumping. The symptoms are: pain over the region; swelling and great local tenderness; change in position or shape of the part; false point of motion; crepitation (crackling, as the broken ends of the bone are rubbed together); and immobility on the part of the patient, together with increased motion secured by the examining surgeon. In impacted fractures there are necessarily no crepitation, false point of motion, or mobility secured by the surgeon. Fractures must be reduced; that is, the fragments must be put into their proper position, and they must be retained by some apparatus. The splints used for retention are made of wood, tin, iron, felt, spongopiline, gutta-percha, leather, or of bandages saturated with plaster of Paris, with starch, or with soluble glass ('water glass,' silicate of soda solution). The limb is padded with cotton and the splint applied closely and rendered immovable. In the case of fractured ribs, a strip of adhesive plaster or a corset is applied. Rest must be secured; otherwise (or, in some cases, in spite of good attention) the fracture remains ununited; when rubbing the ends together, giving mercury internally to salivation, electricity or drilling holes in the ends, or wiring the ends together must be tried, to secure union. Compound fractures must be treated as described, and also as open wounds, under all antiseptic precautions. Drainage of pus and discharge must be secured, as well as protection against bacterial infection. See CALLUS.

FRA DIAVOLO, frä dë-ä'vô-lô (It., Brother Devil) (1770?-1806). A celebrated Italian brigand, born in Calabria, whose real name was Michele Pezza. He gathered a band of outlaws in the mountains of Calabria, in the country around Itri in Terra di Lavoro, and attacked alike strangers and villagers of the neighborhood. His atrocious cruelty and the fact that he had originally been a monk gained him the name of Fra Diavolo. Ferdinand of Naples summoned him to his aid against the French and made him colonel. In 1799, together with Cardinal Ruffo, he tried to stir up an insurrection in Calabria. In 1806 he repeated his attempt. He was seized by Masséna at San Severino, and was hanged at Naples as a bandit in spite of his regular colonel's commission. Auber's famous opera *Fra Diavolo*, libretto by Scribe, does not pretend to the least historical truth.

FRAGA, frä'gä. A town in the Province of Huesca, Spain, about 15 miles southwest of Lérida; on the River Cinca (Map: Spain, F 2). It is built on a slope and has ruined walls; among its buildings of note are the town hall, and the old parish Church of San Pedro, once a mosque. The town is in a fertile agricultural section, celebrated for its figs, which constitute the chief export. Stock-raising and some manufacturing also are carried on. Population, in 1900, 6934. Fraga, according to some authorities, is the *Gallica Flavia* of the Roman Empire. Of

considerable importance under the Moors and for a time a separate emirate, it was captured by the Christians in 1149, after having been previously taken, but retaken. Fraga was specially honored in 1709 by Philip V. for its loyalty in the War of the Spanish Succession.

FRAGIACOMO, frä'jā-kō'mō, PIETRO (1856—). An Italian marine painter. He was born at Trieste, and settled at Venice. A keen observer of nature and a fine colorist, he depicts with equal mastery the sea in many of its various aspects—barks and fishermen, the distant horizon, and the sky with its ever-varying light effects. Especially noteworthy among his paintings are: "Peace" (1891); "Mournfulness" (1892), in the National Gallery, Berlin; and "San Marco," in the Vienna Museum.

FRAGMENTA VATICANA (Lat., Vatican Fragments). A body of law documents in part preserved in a palimpsest, now in the Vatican library. They are thought to date from the time of Constantine.

FRAGONARD, frä'gō'när', ALEXANDRE EVARISTE (1780-1850). A French historical painter and sculptor, born at Grasse. He was the son of Jean Honoré Fragonard, and a pupil of David, whom he always imitated. His works consist of several decorative paintings for the ceilings of the Louvre, some historical pictures, and a bas-relief for the façade of the Chamber of Deputies, taken down to be replaced by a work of the modern sculptor Cortot. His "Triumphal Entry of Joan of Arc into Orleans" is in the Orleans Museum.

FRAGONARD, JEAN HONORÉ (1732-1806). A French genre painter, born at Grasse, in Provence. He studied under Chardin and Boucher, and his manner is distinctly that of the latter master. He won the Prix de Rome in 1752, and went to Italy, where he traveled considerably, and was influenced by the Venetian Tiepolo. Upon his return to Paris he exhibited "Callirhoë" (1765). He then executed various decorative paintings for Mme. du Barry, representing the "Loves of the Shepherds," at Louveciennes, and others for Guimard, the celebrated dancer. Afterwards he gave himself to genre subjects, some of which are suggestive of Greuze. He was also a landscape painter, an engraver, and worked in pastel and water-color. His coloring is charming, his drawing free and graceful, and, despite the often frank indelicacy of his subjects, he is more human than the classicists of David and his school. His works in the Louvre include: "Nymphs at the Bath"; "Bacchante Asleep"; "Music Lesson"; "The Guitar Player;" and "Cupid and a Girl." Other subjects are "The Happy Mother" and "The Cradle." In still another manner are "The Glass of Water," "The Tart," and "The Pot of Milk." His best known etching is "L'Armoire." His drawings include a set for the *Contes* of La Fontaine; these and others, sometimes original, sometimes after the Italian masters, are among his happiest inspirations. Consult: De Goncourt. *L'Art du XVIIIème siècle* (Paris, 1874); and Portalis, *Honoré Fragonard, sa vie et son œuvre* (Paris, 1883).

FRÄHN, frän, CHRISTIAN MARTIN JOACHIM (1782-1851). A German-Russian Orientalist and numismatist. He was born at Rostock, and was educated in that city and at Tübingen and Heidel-

berg. He was appointed professor of Oriental languages at the University of Kazan in 1807, and chief librarian at the Academy of Sciences, Saint Petersburg, in 1815. His principal works treat chiefly of the ethnology of the various races of Russia. They are based upon considerable research and include: *Nova Supplementa* (1855-77); *Ueber die Russen und Chazaren* (1819); *Ibn Fozzlans und anderer Araber Berichte über die Russen älterer Zeit* (1823); *Die ältesten arabischen Nachrichten über die Wolga-Bulgaren* (1832); *Ein neuer Beleg dass die Gründer des russischen Staats Nordmannen waren* (1838); *Rapports concernant des collections orientales de l'Académie Impériale* (1838).

FRAIKIN, frä'kän', CHARLES AUGUSTE (1819-93). A Belgian sculptor, born at Herenthals, Province of Antwerp. He studied at the Academy of Brussels. Among his works are: "Venus," "Captive Love" (1848); eleven statues for the Hôtel de Ville, Brussels; the statues of the counts Egmont and Hoorn, for the great square of that city; a Madonna, "Venus Anadyomene," "The Triumph of Bacchus," and the tomb of the Queen of the Belgians at Ostend.

FRAIL, Mrs. A licentious, shrewish widow, in Congreve's *Love for Love*. She is finally married to Tattle, taking him for Valentine, while he supposes her to be Angelica. She is the sister-in-law of Foresight.

FRAKNÓI, frö'knö-i, VILMOS (1843—). An Hungarian historian, born at Urmény. He was appointed to a professorship at Grau in 1865; was made librarian of the National Museum in 1875, and in 1879 secretary-general of the Academy, of which institution he became vice-president in 1889. His works, based upon exhaustive researches, and mostly written in the Hungarian language, include: *A Popular History of Hungary* (1873); *The Life of Archbishop John Vitéz* (1879); *The Conspiracy of Martinovitch* (1880).

FRAME (AS. *fremman*, *fremian*, Icel. *framja*, *frama*, OHG. *fremman*, *fremian*, to advance, further, from AS. *fram*, from, Icel. *framr*, Ger. *fromm*, earnest, pious; connected with AS. *from*, *fram*, Goth., Icel., OHG. *fram*, from, Gk. *πέραν*, *peran*, Skt. *para*, beyond). A name given to the box-like covering of any kind of hotbed, flued pit, or cold pit, to protect or forward plants at seasons of inclement weather. Frames are usually made of wood, and covered with glass or cloth. The popular form is 6 × 12 feet, and several inches higher at the rear than in front. The word 'cold' used to qualify 'frame' or 'pit' implies the absence of other heat than that from the sun. See HOTBED.

FRAMING. The jointing, putting together, or building up of the skeleton or frame of any structure. The term is used particularly in speaking of steel or wooden buildings and ships. See BUILDING; SHIPBUILDING.

FRAMINGHAM, frä'ming-hām. A town in Middlesex County, Mass., including the villages of Framingham Centre, South Framingham, Saxtonville, and Nobscot, 21 miles west of Boston, on the Boston and Albany and the New York, New Haven and Hartford railroads (Map: Massachusetts, E 3). It is the seat of a State Normal School, and has a public library, an historical and natural history society with a valuable collection, an almshouse, a hospital, and a

Home for the Aged. South Framingham is the principal business part of the town, and has manufactures of boots and shoes, chairs, rubber and straw goods; and Saxonville has extensive woolen cloth and yarn mills. The government is administered by town meetings. Framingham was settled about 1647, was known as Danforth's Plantation until 1700, when it was incorporated under its present name (from Framingham, England). Population, in 1890, 9239; in 1900, 11,302. Consult: Barry, *History of Framingham* (Boston, 1847); Temple, *History of Framingham* (Framingham, 1887).

FRA MOREALE, mō'rā-k'ā. See MONTREAL D'ALBANO.

FRANC, *Fr. pron.* frānk (Fr., derived from the device, *Francorum Rex*, King of the Franks, struck by King John II. on the coin in 1360). The unit of the monetary system of France and of the States of the Latin Monetary Union—Belgium, Switzerland, Italy, and Greece. At the present time the franc is in fact the twentieth part of the twenty-franc gold piece, or 2902 grams of pure gold, equivalent in United States money to 19.3 cents. When the present monetary notation was adopted in France, in 1795, supplanting the former livre tournois, the franc was a silver coin, nine-tenths fine, weighing five grams. Such coins ceased after 1865, when the franc coin was made a token, 835 fine, without change of weight. As a silver unit it still remained in its multiple the five-franc piece, nine-tenths fine, weighing 25 grams. In 1876 the coinage of the five-franc piece was discontinued. Silver coins of 5, 2, and 1 franc, and $\frac{1}{2}$ franc, are still in general use; but they are all, strictly speaking, tokens, gold having become the standard, and being represented in the coinage by pieces of 10 francs and 20 francs. The franc is theoretically divided into 100 centimes; but as the smallest coin in France is the five-centime piece, the old appellation of 20 sous to a franc (or livre) is still in frequent use. In Italy the franc is called lira, and in Greece drachma. In other countries not in treaty relations with France, the same unit prevails; in Finland, the marc; in Spain, the peseta; in Rumania, the lei; in Venezuela, the bolivar. See LATIN UNION.

FRANC, MARTIN LE (1410-61). A French poet, born in Normandy. He became secretary to the Duke of Savoy, afterwards Pope Felix V., and through him obtained various lucrative appointments, such as secretary to Nicholas V. Despite its accumulation of tedious detail, his long poem, *Le champion des dames* (1530), is now highly valued on account of its contemporary references and its vivid local color of the fifteenth century; and the same may be said of his prose work, *L'estrif de fortune et de vertu* (1519).

FRANÇAIS, frān'sā', FRANÇOIS LOUIS (1814-97). A French landscape painter, born at Plombières, Vosges. He did not enter the Ecole des Beaux-Arts until 1834. While there he studied under Corot and Jean Gigoux, and exhibited first in the Salon of 1837. Many of his lithographs are remarkable, and he was also an excellent engraver on wood; but it is as a landscape painter that he stands highest. Although many of his subjects are Italian, he is particularly the painter of the banks of the Seine and the country about Paris. Français belongs to no school; he is an idealist, from the essentially poetical qual-

ity of his brush, and a realist because of his perfect sanity and the restraint and decision of his work. "The End of Winter" (1853), "Orpheus" (1863), and "Daphnis and Chloë" (1872), his masterpiece, and "Evening," are in the Luxembourg. He received first-class medals in 1848, and at the Paris expositions of 1855 and 1867, and medals of honor at the Paris Exposition of 1878 and the Salon of 1890, and the cross of the Legion of Honor in 1867.

FRANCAVILLA, frān'kā-vē'lā. A city in South Italy, in the Province of Lecce, midway between Taranto and Brindisi (Map: Italy, K 10). It manufactures cloth, leather, and leather goods, and markets oil and wine. Population, in 1881, of commune, 16,000; in 1901, 20,422.

FRANCE. A republic of western Europe, lying between latitudes 42° 20' and 51° 5' N. and longitudes 4° 48' W. and 7° 31' E. from Greenwich (7° 8' W. and 5° 11' E. from Paris). It is bounded on the north by the English Channel, Strait of Dover, and North Sea; on the northeast by Belgium and Luxemburg; on the east by Germany, Switzerland, and Italy; on the south by the Mediterranean and Spain; and on the west by the Bay of Biscay, Atlantic Ocean, and the English Channel. In outline the country is roughly hexagonal, and its perimeter is about equally distributed between seacoast and frontier. The extreme length from the North Sea to the Pyrenees is about 600 miles; the greatest breadth from the extremity of Brittany to the Vosges is about 550 miles, and diagonally, to Mentone on the Mediterranean, about 675 miles. France ranks fourth in size among European countries; its area, according to official surveys, is 204,199 square miles, and, according to the determinations of the War Department, which are believed to be nearer correct, 207,060 square miles. Included in these totals are the island of Corsica and many small islands, with an aggregate surface of 3700 square miles.

TOPOGRAPHY. France possesses natural boundaries throughout, and is to a high degree an independent physical unit. The eastern border is girdled by the ranges of the Alps, the Jura, the Vosges, the Rhenish Highlands, and the Ardennes, which separate France from the countries of central Europe; the Spanish frontier is defined throughout its extent by the Pyrenees. The ranges on the east are broken in places by gaps and passes, through which commercial communication is maintained with the bordering States. The Pyrenees, however, present a great unbroken wall, communication with Spain being had around their extremities. On the northwest, west, and southeast the boundaries are formed by open seas, the total coast-line measuring about 1950 miles. Much of the coast-line is unbroken by important inlets, with the result that good harbors are comparatively few. Most of the harbors are river ports or are protected by breakwaters, as at Cherbourg. The northwestern coast, which confronts the southern shores of England, is intersected by the deep inlets of the Somme and the Seine, and has an irregular course, owing to the prominent peninsula of Normandy (called Cotentin), to the many capes, and to minor indentations. It varies in character from low, sandy stretches, as on the North Sea, to bold, rocky cliffs, such as are ex-

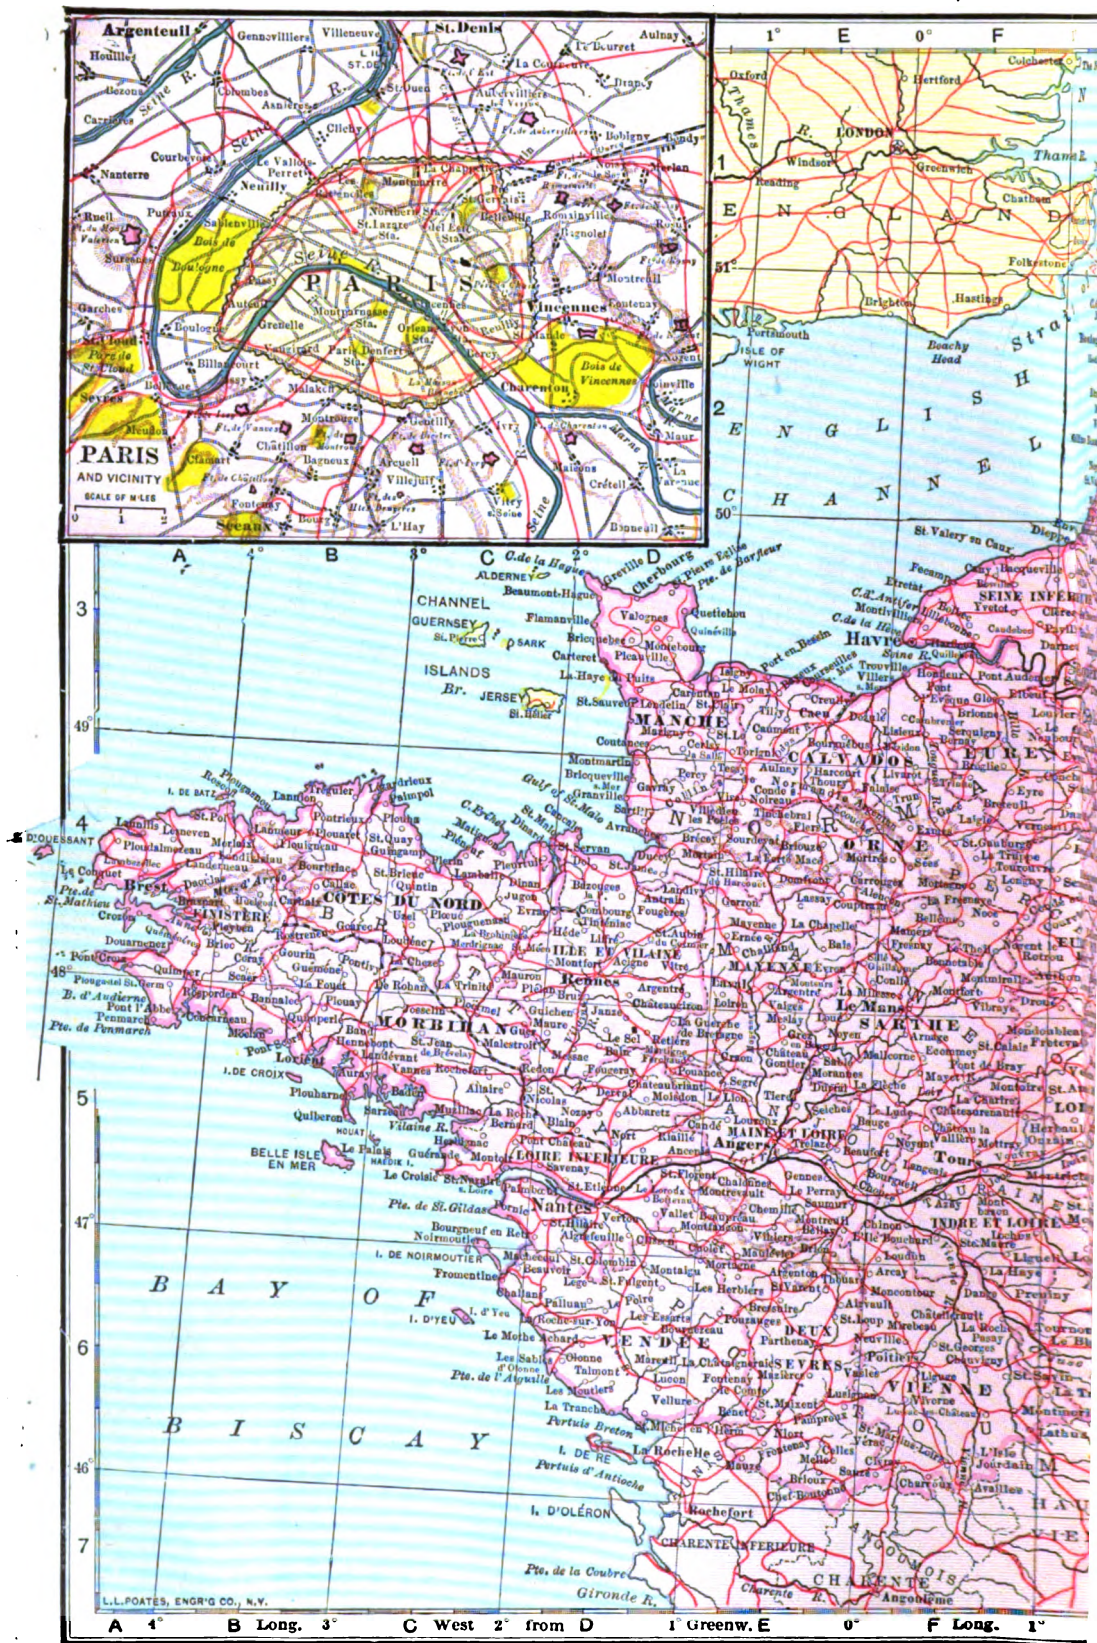

posed in the Pays-de-Caux, between Dieppe and Havre, and on the north coast of Brittany. Between the latter peninsula and Normandy is the broad indentation occupied by the Gulf of Saint-Malo, with the Channel Islands, comprising Jersey, Guernsey, Alderney, Sark, etc., which are held by Great Britain, although physically belonging to the mainland. The western coast, from Pointe Saint-Mathieu, the extremity of Brittany, to the Gironde, maintains an irregular outline, and is intersected by the bays of Douarnenez, Quiberon, Bourgneuf, by the Pertuis Breton, and the Pertuis d'Antioche, and by the estuarine mouths of the Loire and the Gironde. The low and generally sandy shore is fringed by islands, of which the largest are Ouessant (Ushant), Belle Ile, Ile de Noirmoutier, Saint Martin de Ré, and Ile d'Oléron. Southward of the Gironde the coast, formed by a straight, monotonous stretch of dunes, is bordered by the arid moors of the 'Landes,' the Bassin d'Arcachon being the only important indentation in this section. The Mediterranean coast, by which France enjoys easy access to Africa and the East, stretches in a broad double curve from the Pyrenees to the Maritime Alps. Bold and rocky on the extreme west, it soon becomes low and sandy, inclosing numerous lagoons, but without good harbors. Near the middle the Rhône has built its delta seaward, and incloses between its mouths the island of Camargue. East of the Rhône the shore conforms to the projecting spurs of the Provençal Highlands, and of the Maritime Alps, which shelter the harbors of Marseilles, Toulon, Cannes, and Nice.

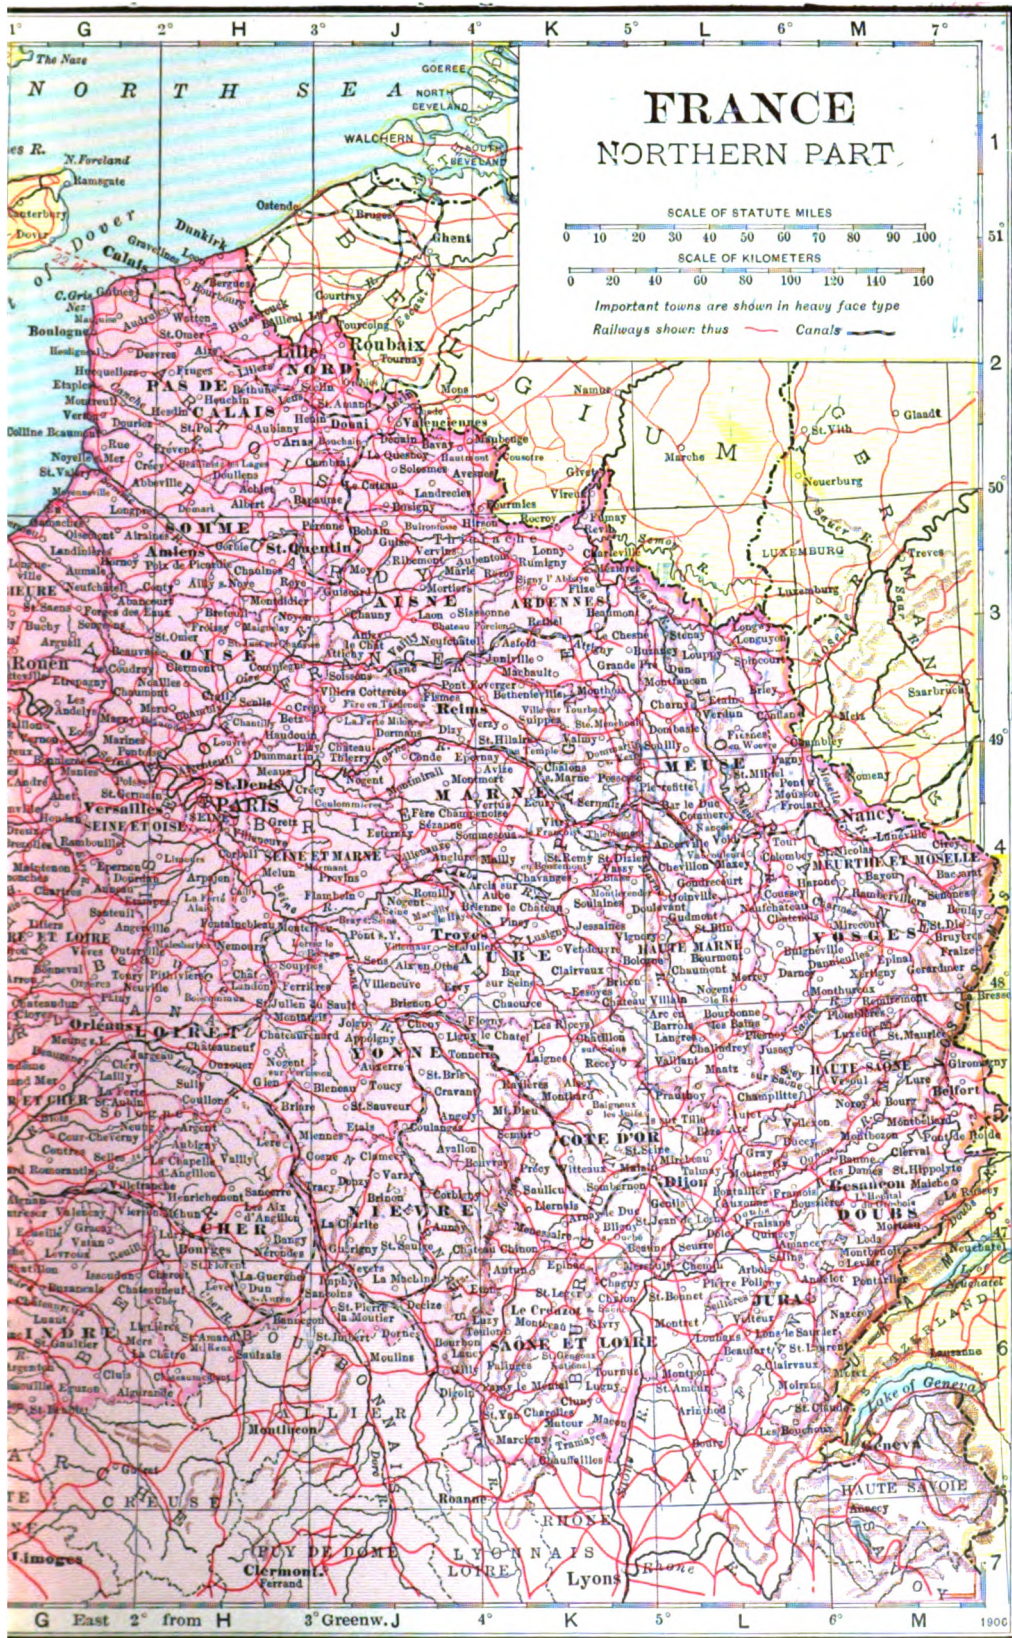

The physiography of France, broadly considered, falls naturally into regions that are determined, in their position and surface features, by the events of geological history. There are thus the regions of highlands on the eastern and southern borders, the great Central Plateau in the south-central part west of the Rhône Valley, the lower plateau of Normandy and Brittany, and the extensive plains in the north and west, occupied by the basins of the Seine, the Loire, and the Garonne. A line drawn diagonally across the country from Bayonne in the southwest to the Ardennes of southern Belgium in the northeast roughly divides the rolling low plains to the west of it from the central plateau and highlands to the east of it. The mean altitude of the country is about 1000 feet; but the western section averages less than 650 feet. As the chief relief is concentrated in the south and east, the land slope is toward the Atlantic; the Rhône alone, of the large rivers, takes a southerly course into the Mediterranean.

The Alps on the southeastern border are the most important highlands in the country. They extend from the Mediterranean north to Lake Geneva, a distance of 150 miles, and with the flanking chains and foothills they occupy the entire area between Italy and the Rhône Valley. The principal groups are the Maritime, the Cottian, the Graian, and the Pennine Alps; or, according to their situation in former provinces, they may be divided into the Alps of Provence, Dauphiné, and Savoy. The Maritime range on the extreme south enters France from Italy, where it has its culminating point, the highest peak across the border, French territory, being the Cime du Diable, 8816 feet. To the north the ranges increase in elevation, and the Cottian Alps are

crowned by the Aiguille de Scolette, 11,500 feet above the sea. Across Mont Genève a pass leads from the valley of the Durance, in France, to that of the Dora Riparia, in Italy, which has been used as a highway since ancient times. West of the Cottian range is the small group of the Oisans, culminating in Les Ecrins, 13,462 feet, and north of it are the lofty Graian Alps, snow-capped and carrying glaciers on their rugged slopes, with a crest averaging nearly 10,000 feet in altitude. Near their southern end are the Pass of Mont Cenis (8850 feet), and the railway tunnel of the same name, now the principal line of communication with Italy. The Alps culminate in Mont Blanc (15,781 feet), of the Pennine range; and thence northward to the shores of Lake Geneva there is a gradual decrease in altitude. Interrupted by the valley of the Rhône, the line of highlands is continued on the north by the Jura Mountains, which are formed by several parallel groups resting upon a plateau tilted toward the west, and thus falling to the valleys of the Saône and the Doubs. The Jura Mountains follow a nearly north direction at first, but gradually bend to the east and enter Swiss territory, where, or on the frontier of France, they attain their maximum elevation of over 5600 feet (Crêt-de-la-Neige). The Vosges Mountains, separated from the Jura by the gap at Belfort, now form a part of the French frontier, their eastern slopes fronting upon Alsace, which since 1871 has been incorporated into the German Empire. Their crest is a flat-topped mountain ridge, broken by peaks of 4000 to 4700 feet elevation, connecting in the southern part with the Monts Faucilles, a low range that extends westward in the form of an arc between the sources of the Saône and the Meuse and Moselle. A northern offshoot of the latter highlands stretches along the left bank of the Meuse, and is continued by the Forest of Argonne to the low plateau of the Ardennes, of which only a small portion lies in France. The Pyrenees, rising with great abruptness on the southern border, extend from the Mediterranean to the Bay of Biscay. A height of 9100 feet is attained in Mont Canigou, near the Mediterranean, and farther west this altitude is exceeded by Montcalm (10,000 feet), Pic Long (10,475 feet), Pic du Midi (9440 feet), and by others on the French side, and by still loftier elevations south of the border. In its conformation the chain is a true sierra, having a uniform crest line that is notched by slight gaps, usually but little below the level of the neighboring peaks. Passes, practicable for railways, are found along the low coast strips at the extreme ends; but between these points there are but few highways leading from France to Spain that can be traversed without great difficulty.

The Central Plateau, south of the Loire and west of the Rhône, is the chief physiographic feature of central France. The plateau rises sharply from the Mediterranean and Rhodanian depressions in several groups of highlands that are collectively known as the Cévennes. Beginning on the southwest with the Montagne Noire, at the passage of Naurouse, between the Aude and the Garonne, which lies at the base of the Pyrenees, the elevations include in their generally northeasterly course Monts de l'Espinousse, Monts Garrigues, and the Cévennes in the lesser sense, terminating with Mont Lozère (5584 feet).

Northward the range is continued by the Monts du Vivarais, with the volcanic Mont Mézenc (5755 feet), by the mountains of Lyonnais and Beaujolais, and by a succession of highlands to the elevated region of Côte d'Or, and the plateau of Langres, between the Saône and the sources of the Seine. The Central Plateau gradually falls off in elevation to the northwest, but in Auvergne it has been broken by volcanic eruptions. The denuded cones of the extinct volcanoes are still conspicuous in numerous minor elevations near Clermont-Ferrand, and in the more massive mountains—Puy-de-Dôme (4806 feet), Mont Dore (6187 feet), and Plomb du Cantal (6096 feet). South of the volcanic region the plateau receives a special character by the Causses, sterile limestone tablelands whose surface has been dissected by erosion into deep gorges and ravines. North of this region the low mountains of the Morvan range divide the waters of the Loire and the Saône. Bordering the Central Plateau are the fertile plains of central France on the north, the plains of Périgord and Poitou on the west, and the plains of Gascony across the Garonne on the southwest.

Normandy and Brittany (ancient Armorica) are to be considered as an isolated plateau whose surface, worn down by long-continued erosion, has a general altitude of less than 1000 feet. In Brittany the plateau is broken by two lines of highlands—the Monts d'Arée and the Montagne Noire—which run out to the two promontories that inclose the Bay of Douarnenez. The Monts d'Arée on the north culminate in Saint Michel (1285 feet), the highest peak in Brittany, and the Montagne Noire in Menez Horn (1080 feet). In Normandy the elevations are grouped along no general lines; but the surface shows an alternation of low hills and open valleys. The woodland region of the Norman Bocage, in the Department of Calvados, attains an elevation of 1000 feet in a few places, and in the Forest of Ecoves, near Alençon, Mont des Avaloirs rises to a height of 1370 feet.

Corsica, a part of France since 1768, belongs physically to Italy, with which it is united by a submarine plateau. It is traversed from north to south by a mountain range, which descends on the east to a narrow coastal plain, while westward it sends out spurs that project into the sea as promontories inclosing many good harbors. The interior of the island is wild and rugged, and is dominated by peaks of considerable altitude, the highest being Monte Cinto, 8900 feet above the sea.

HYDROGRAPHY. The large drainage systems of France are those of the Rhône, the Garonne, the Loire, and the Seine; the northeastern part of the country is included in the basin of the Moselle (which flows into the Rhine) and in that of the Meuse. The Rhône, which in point of discharge is the largest of the rivers, rises in Switzerland and enters France at the gap between the Alps and the Jura, flowing first southwesterly into the Rhodanian depression, where it is joined by its largest tributary, the Saône, from the north, and then sweeping to the south toward the Mediterranean. Through the Isère and Durance it drains most of the Alpine region of France, but has no important branches from the west. The basin of the Rhône covers an area of about 38,000 square miles. The Garonne, the Loire, and the Seine follow the gen-

eral land slope, and drain into the Atlantic. The Garonne, with a basin of 33,000 square miles, rises on the Spanish side of the Pyrenees, and flows in its middle course along the southwestern edge of the Central Plateau, from which it receives the Tarn-Aveyron, the Lot, and the Dordogne. At its mouth it widens to form the estuary of the Gironde. The Loire, the longest of the rivers, drains the great basin of west-central France, with an area of about 46,000 square miles. It rises on the slopes of Mont Mézenc, in the Cévennes, about 30 miles from the Rhône, and thus crosses the whole breadth of the Central Plateau. The chief branches of the Loire are: On the north, the Mayenne, Sarthe, and Loir, which unite to form the Maine; and on the south, the Allier, Cher, Indre, and the Vienne-Creuse. The Seine collects the waters from the northern part of the Central Plateau, over an area of about 30,000 square miles. From the north it is joined by the Oise, Marne, and Aube, and from the south by the Yonne and Eure. Besides the four great river systems, there are several minor streams of importance, such as the Somme, Orne, Vilaine, Charente, Adour, Aude, and Hérault, the last two flowing into the Mediterranean. More than 200 rivers are officially reported as navigable, for an aggregate distance of about 6000 miles. Even the largest, however, show such fluctuations in volume between periods of floods and low water that they are not continuously navigable except by light-draught boats. The Seine is most important for commerce, being navigable for river boats beyond Paris. The utility of the natural waterways is much augmented by the extensive systems of canals that connect them; so that, for example, the canals on meeting the eastern and western rivers provide waterways across France to Belgium and Germany; the northwestern seaports of Brest and Saint-Malo are joined by river and canal with the Loire; and the Gironde is extended by canal to the Mediterranean. About one-fourth of France's internal trade is carried on the waterways. There are but few lakes in France. Aside from the brackish or fresh-water lagoons along the coast, the largest are in the Alps, within the Rhône Basin. The largest of these, Lake Geneva, belongs only in part to France, the northern shore lying in Switzerland. Other well-known lakes of this region are Annecy and Bourget.

CLIMATE. The climate varies considerably between the coastal and the elevated interior regions, but it is characteristically temperate. On the Atlantic seaboard the temperatures are equalized by the warm ocean currents and southwesterly winds; toward the interior the extremes of winter and summer are more marked, and the isotherms trend steadily southward. The temperatures at Brest average for the year about 52° F., for January 43°, and for July 63°, while at Paris the yearly mean is 50°, the January average 36°, and the July average 65°. On the eastern frontier the climate has a continental character, the winters being long and severe and the summers hot. Thus, at Nancy, which is nearly in the same latitude as Paris, the annual mean is 48°, the January mean 32°, and the July mean 65°. The greatest contrast is exhibited between the bleak climate of the Central Plateau and the eastern highlands, and the warm, almost subtropical, climate of the Mediterranean coast.

The prevailing winds blow from the south and west, and from the north and northwest. The southerly and westerly winds, being warm and moisture-laden, are responsible for the most of the rainfall. A local wind, the 'mistral,' which descends from the Central Plateau upon the Mediterranean coast, is remarkable for its constancy and force. At Marseilles it blows on an average 175 days in the year, sometimes with such violence as to overturn railway trains and to denude trees of their foliage. It has a chilling effect; but by clearing the atmosphere it brings sunshine and healthfulness to the region. The rainfall, which averages about 30 inches for the whole country, is greatest along the seacoast, and in the elevated regions of the Cévennes, the Pyrenees, and the Alps, where the annual precipitation usually exceeds 40 inches. The smallest average (10 inches) is found in certain interior districts of the northern plains.

FLORA. The flora of France is typical of that of Continental Europe, since plants indigenous to each region may be found in some part of the country. Except on the summits of Mounts Cantal and Dore, which were more recently formed than their neighbors, the mountain crests are tipped with species of lichens and mosses peculiar to the Arctic-Alpine regions. With lessened altitude appear species in a succession similar to their sequence in decreasing latitude—mustards, crow-foots, dwarf willows, and birches. With continued descent the trees, shrubs, and herbs characteristic of northern European forests are met with—pine, spruce, ash, beech, and oak. As the level of the sea in the south of France is approached, species indigenous to that latitude are encountered—chestnut, poplar, mulberry. The products of the northern districts and of the higher elevations are wheat, rye, oats, grapes, apples, and pears; of the middle, corn, potatoes, peaches, apricots, cherries, and strawberries; of the southwestern, grapes, prunes, figs, and various nuts; and of the Mediterranean coast, oranges, lemons, olives, and pomegranates. See DISTRIBUTION OF PLANTS; ECOLOGY; and the paragraph on *Flora in EUROPE*.

FAUNA. The fauna of France is representative of Western Europe. The wide variety of climate and physical features its extensive surface affords gives room and conditions for a great diversity of animal life. A sixth or more of its surface is covered with forests; and lofty mountains, broad, sandy plains, and a great length of coast offer suitable homes for representatives of the whole fauna of temperate Europe. Many large quadrupeds have become extinct or have been reduced to a semi-domestic condition during the centuries of human occupation. An account of the aboriginal fauna and its partial disappearance is given under EXTINCT ANIMALS. Bears still survive in the Pyrenees, and wolves lurk in the forested foothills of the mountains along the Swiss and Italian borders. Wildcats are very rare, but a civet (the genet) and foxes are not uncommon, while several weasel-like carnivores occur widely. The higher mountains contain a few chamois; the mouflon remains in Corsica; and the native wild boar and fallow deer are preserved on many private estates. The porcupine is the most interesting of the many rodents as a survival near the Mediterranean of ancient forms. The birds embrace a very large list, most of which are common to all Europe. Regular routes

of migration between northern latitudes and Africa traverse France, one by way of Spain and the Atlantic coast, another across the Mediterranean by way of Sardinia and Corsica, and thence into and beyond France along the valleys of the Rhône, Loire, Saône, and Meuse. Some peculiar southern birds occasionally appear, as the sand-grouse; and others are habitually present in the south of France, as the bee-eater and hoopoe. The great coast-line brings all of the wandering sea animals of the North Atlantic to French shores, which are rich in fisheries, oyster banks, and plantations, and littoral life generally. The Mediterranean gives a separate sea fauna. Among reptiles only the adder, more or less observable everywhere, need be mentioned. Cyprioids are the most characteristic inland fishes. See EUROPE; DISTRIBUTION OF ANIMALS; and articles upon neighboring countries.

GEOLOGY. The Central Plateau is the geological nucleus of France, around which sedimentary strata have been deposited during the Paleozoic and succeeding periods. In this region the rocks comprise granites, gneisses, and schists of Archæan character, overlaid in places by later volcanic flows of basalt and trachyte. The northern and western plains were built up during Mesozoic and Tertiary times by sedimentary accumulations along certain lines that correspond generally with the present basins of the Seine, the Loire, and the Garonne. Normandy and Brittany, however, are of more ancient (Paleozoic) formation, and resemble in geological structure the southwestern part of England, with which this portion of France was once united. The bordering highlands were uplifted at different times. The Ardennes and the Vosges consist of early Paleozoic strata, with small areas floored by Devonian and Carboniferous, the latter containing the most important coal deposits of the country. The Jura range has lent its name to the Jurassic system, which here includes thick beds of limestones and sandstones that are continued eastward into Germany. In the Alps the central granite axis is flanked by Mesozoic strata, upturned and sharply folded. The Pyrenees did not assume their present form until late Tertiary times, when there was an extensive upheaval which parted the waters of the Mediterranean and the Atlantic. Between the Central Plateau and the eastern highlands an arm of the sea once extended as far north as the Paris basin; its bed was elevated at the close of the Pliocene, and has since been occupied by the basin of the Rhône.

MINERAL RESOURCES. The coal-fields of France, while they are limited to the comparatively small area of about 2100 square miles, are the most valuable of the nation's mineral resources. The deposits are distributed over a number of small areas, including those of Nord and Pas-de-Calais (Valenciennes), which together yield 60 per cent. of the total production, and those of the Loire (Saint-Etienne), Nivernais (Le Creusot), Gard (Alais), Bourbonnais (Commeny), Tarn, and Aveyron. They furnish a good quality of bituminous coal, suitable for fuel purposes and to a less extent for iron-making. Small amounts of anthracite are mined in the Department of Isère, and about 600,000 tons of brown coal are produced annually from the deposits near Marseilles and in the Pyrenees. The output of coal in France has shown a small but

steadily increase during the last decade, amounting in 1900 to 33,404,298 metric tons, against 26,093,118 tons in 1890; yet the supply is insufficient to meet the home consumption, though the chief fuel used for domestic purposes is wood, and from 10,000,000 to 12,000,000 tons are imported annually. The development of manufacturing industries is retarded by lack of fuel, and especially by the high rates of transportation, which raise the price of coal up to \$8 per ton or more in the districts far from the mines. These conditions have necessitated the extended use of water-power, with which the country fortunately is well supplied. The coal-mining industry employs about 160,000 laborers, and the value of the annual product is nearly \$100,000,000.

Iron ore is extracted from the Jurassic rocks in the Department of Meurthe-et-Moselle and at Vassy in Champagne. Some ore is produced also in the Pyrenees and in the departments of Gard, Isère, Haute-Marne, and Saône-et-Loire. It is to the disadvantage of France's industries that her coal has to be brought to her iron, as the deposits are found together only in the districts around Le Creusot and Saint Etienne. In iron and steel manufacture France ranks about on an equality with Russia, and is surpassed by the United States, the United Kingdom, and Germany. The output of pig iron in 1900 was 2,699,494 metric tons, and of steel 1,624,048 tons, as compared with 1,962,126 tons and 581,998 tons respectively in 1890. To make this production about 2,000,000 tons of foreign ore were required in addition to the domestic supply. The chief centres of the iron and steel industry are Fives-Lille (Nord) and Le Creusot (Saône-et-Loire), the latter city rivaling Essen in Germany in its great establishments for turning out heavy ordnance and steel castings. In the production of other metals France has no special prominence. Copper is smelted near Lyons and in the Department of Pas-de-Calais, foreign ore being used almost entirely. The output in 1900 was 6466 metric tons. The production of zinc for the same year was 36,305 tons; of lead, 15,210 tons; of nickel, 1700 tons; of antimony, 1573 tons; and of silver, 85,646 kilograms. Most of the lead, zinc, antimony, and silver product was derived from domestic ores, while the nickel was imported from the French colony of New Caledonia.

In building materials and quarry products generally France is well endowed. The stone industry gives employment to more than 100,000 laborers, and the annual product is valued at about \$15,000,000. Marble is quarried in the Alps and Pyrenees, granite, sandstones, and limestone in numerous localities. The French millstones, celebrated for their good quality, come from Ardèche. The value of the roofing-slates, mostly from the Ardennes, which amounted to \$3,427,985 in 1900, is second only to that of the output of Great Britain. Phosphate rock, used in the manufacture of fertilizers, is quarried in the departments of Meuse and Pas-de-Calais, the product in 1900 amounting to 587,919 metric tons, valued at \$2,827,291. Large quantities of this material are mined by French companies in Algeria, and shipped to France for manufacture. The output of salt in 1900 was 1,088,634 tons, this amount representing both rock and brine salt from the departments of Doubs, Jura, Basses-Pyrénées, Haute-Saône, and Meurthe-et-Moselle, and sea-salt from the Atlantic and Mediterranean coasts. Clay,

gypsum, asphalt, bituminous rock, mineral paints, and lime are produced in quantities generally sufficient to meet the home consumption.

The mineral springs of France are numerous and of varied character. They are situated mostly in the mountain district of Auvergne, and in the regions bordering the Alps, Vosges, and Pyrenees. The places best known for their baths and medicinal waters are Aix, Aix-les-Bains, Enghien, Bagnères-de-Bigorre, Bagnères-de-Luchon, Barèges, Vichy, Dax, Plombières, Bourbonne-les-Bains, Bourboule, Forges-les-Eaux, and Saint-Sauveur.

FISHERIES. The fishing industry is on a vast scale, giving employment to over 155,000 people. The value of its products exceeded \$17,000,000 in 1888, and rose to more than \$24,000,000 in 1898. Pilchards and mackerel are caught in large quantities off the coasts of Normandy and Brittany. The western coasts have extensive oyster and mussel beds; tunnies and anchovies are caught on the shores of the Mediterranean. French boats fish in the North Sea, at the Newfoundland fisheries, and off the coast of Iceland. Oyster-breeding is constantly growing in importance; in 1897 967,000,000 oysters were procured in that way as compared with but 100,000,000 in 1881. French oysters are smaller and somewhat inferior to the American product. Sardine-packing is another lucrative branch of the fishing industry, and receives Government subsidy exceeding \$1,000,000 annually.

AGRICULTURE. Its geographical position, fertile soil, and mild climate combine to make France an agricultural country. Agriculture has been the chief occupation of its inhabitants for centuries, and the French peasant and landlord have been distinguished for their quickness in adopting improved methods of cultivation following the discoveries of science; at the present day agriculture furnishes employment to more than 6,600,000 people. The most fertile sections of the country are in the north and northeast, and along the valleys of the Garonne and Rhône. The least productive are the marshy *landes* of the southwest and the mountain regions of the Pyrenees and Alps. The cultivation of cereals, wine-growing, and cattle-raising are the principal branches of agriculture. Nearly 84 per cent. of the total area of the country is productive; about 12 per cent. consists of sand, rocks, marshes, and other unproductive surface. The remaining 4 per cent. represents urban and other non-agricultural land.

CEREALS. More than 57 per cent. of the land under cultivation and more than one-fourth (over 28 per cent.) of the total area of the country is devoted to the production of cereals. This area, 36,637,517 acres, is second only to that of Russia in the whole of Europe. Nearly one-half of this area is devoted annually to the production of wheat, which gives it first place in order of importance. Unlike other European countries, notably Great Britain, which have found it necessary to curtail the cultivation of wheat because of American competition, France has fairly held her own in that regard, the area under wheat at the close of the last century having declined less than 2 per cent. since 1862. The area devoted to it in 1899 was 17,141,806 acres, or about eight times that of Great Britain, the yield for the same year being 362,666,600 bushels. Wheat is largely raised in the north, in the west, in the central parts, and in the basin of the Garonne. Previous to 1860 rye bread was the staple food

of the peasantry, but after that time they began to discard rye for wheat, so that the people now, though consuming much rye, are preëminently a nation of wheat-eaters. The relative importance of the various grains raised in France is shown (census of 1892) by the following table:

	Per cent. of total area under cereals	Per cent. of total value of cereals
Wheat.....	48.3	58.7
Oats.....	25.7	20.2
Rye.....	10.6	9.5
Barley.....	5.7	4.5
Buckwheat.....	4.1	2.3
Corn.....	3.6	2.8

As may be seen from the above figures, oats is next in importance to wheat, occupying more than a fourth of the total area under cereals, and yielding one-fifth of their total value. France ranks third in Europe, next to Russia and Germany, in the extent of area devoted to oats, and is second only to the former in the yield of that crop. The area under oats increased about 15 per cent. in the last forty years of the century. Rye, barley, buckwheat, and corn all declined in importance, as the following figures show:

AREA UNDER CULTIVATION

	Thousands of acres		Per cent. decline
	1862	1900	
Rye.....	4,764	3,509	26.0
Barley.....	2,666	1,871	43.6
Corn.....	1,460	1,337	7.8
Buckwheat.....	1,663	1,490	9.9

Corresponding to the decline in area there has been a decline in the production of grain. Thus the total cereal crops of France rose from 745,166,600 bushels in 1862, to 835,833,300 in 1882, declining to 759,333,300 in 1892 and 733,166,600 bushels in 1900.

FRUIT AND VINE GROWING. France is famous for her fruit, and especially for the product of her vineyards. Apples, plums, pears, peaches, and cherries abound in the north and central parts of the country, while the orange, lemon, and olive thrive in the south. Nuts also grow in great abundance. The annual crop of the French orchards and nut-bearing trees is valued at about \$45,000,000, of which the various nut products constitute more than 40 per cent. The most important of these is the chestnut, the annual value of which, some \$7,000,000, is the largest single item in the revenue of the French nut-growers. It grows on the poorer lands of the country, and in the mountainous regions of Auvergne and Corsica, and constitutes a staple food of the inhabitants. The vine has from a very early period constituted one of the principal sources of the agricultural wealth of France. The mild climate and the soil of the country are especially adapted to its cultivation. The choicest grapes are grown in Bordeaux, Burgundy, and Champagne, but some excellent kinds are produced on the banks of the Loire and in some of the southern departments. The area devoted to this culture has diminished during the last quarter of the century. In 1901 the area was about 4,324,250 acres, as compared with 5,552,300 in 1875. The vine culture has

from time to time received serious checks through attacks by the fungus known as the *oidium*, which inflicted such serious damage that in 1854, the worst year, the acre yielded less than one-fourth of its average quantity. Another destructive disease is caused by the ravages of an insect known as *Phylloxera vastatrix*.

The damage wrought by these diseases is shown by the fact that the average yield per hectare, which steadily rose from 562.07 gallons in 1788 to 857.28 gallons in 1850, began to decline after that year until it fell to 485.48 gallons in 1892. In 1878 the French Government took the first step to combat the evil. By a series of legislative enactments calculated to encourage a war of extermination against the insect, the Government finally succeeded to such an extent that in 1900 the yield per hectare rose to 1031.38 gallons. The most effective means of overcoming the ravages of phylloxera was the importation of American vine stock upon which the French vines were grafted. The following figures illustrate the progress of the wine industry in the nineteenth century. In 1808 there were produced 742,000,000 gallons; in 1829, 820,784,500; in 1848, 1,367,983,000; in 1880, 789,832,500; in 1890, 726,524,000; in 1900, 1,784,854,500.

Stock-raising is of secondary importance in France, domestic stock being far from sufficient to meet the home demand. In 1840 the area of pasture land was 14,260,000 acres; in 1862 it increased to 19,258,980; in 1882 to 22,426,790; in 1892 to 23,358,360. In 1900 the natural or permanent pastures covered an area of 13,753,580 acres, as compared with about 14,828,000 in 1892. There were 14,521,000 cattle in 1900, as compared with 13,709,000 in 1892 and 12,997,000 in 1882. The dairy industry flourishes, especially in the north, where the products are exported to England. Horses are raised principally in the north and west. The raising of fine breeds is an object of special care on the part of the Government in the interests of the army. The number of horses has, on the whole, been stationary since 1862, the figures in 1862, 1882, and 1900 being 2,914,000, 2,838,000, and 2,903,000 respectively. Sheep-breeding is important. However, in spite of the efforts of wool-growers, the number of sheep declined from over 32,000,000 in 1842 to 29,500,000 in 1862, 23,800,000 in 1882, and 20,200,000 in 1900, a decline which had to be covered by importations. In 1900 more than 1,000,000 were imported. The number of hogs, which was on the increase until 1892, declined during the last decade of the century, being but 6,740,000 in 1900, as compared with 7,421,000 in 1892. The best breeds are raised in Champagne and the Pyrenees. Importation is necessary to meet the home demand. Goats, mules, and asses are among the animals of the French peasant. The exports of poultry, eggs, and feathers net several millions of dollars annually. Apiculture is also well developed; there were more than 1,600,000 beehives at the close of the century, yielding an annual product of honey and wax, valued at more than \$3,000,000.

INDUSTRIAL PLANTS. Beets owe their importance to the manufacture of beet-sugar, which originated during the early part of the nineteenth century. During the prevalence of the vine-disease, beets were employed in the manufacture of alcohol. The cultivation is carried on chiefly in

the north and east; the area devoted to that plant increased from 509,520 acres in 1890 to 626,400 in 1900. The exports of beet-sugar exceeded the imports during that year by over half a million tons. Hemp and flax are grown chiefly in the north. Their cultivation is greatly on the decline, the area having decreased from 158,150 acres in 1880 to less than 44,475 in 1900; as a result, a considerable quantity of flax is imported each year. The cultivation of the mulberry-tree, introduced in the reign of Henry IV. (1589-1610), derives importance from its bearing on the production of silk. This industry receives assistance from the Government and is carried on in twenty-seven departments, the chief being Drôme, Gard, Ardèche, and Vaucluse. Nearly 150,000 persons are engaged in silk culture. For years after 1860 the production increased, though it has always fallen far short of 1850, when 25,000,000 kilograms of cocoons were raised. The average of the last decade of the nineteenth century was 8,000,000 kilograms of cocoons or 2,000,000 kilograms of raw silk. Between 1894 and 1900 the production slowly declined, the growers being discouraged by unsatisfactory profits. The production of raw silk is less than one-fifth of that of Italy. Of the other industrial plants tobacco and hops are the most important. Tobacco production, manufacture, and sale is a Government monopoly and a source of large revenue. Production is restricted to twenty-five departments, the cultivation of the plant being forbidden whenever the yield falls below a certain quantity.

LAND TENURE. France is a country of small farmers, the inheritance laws having contributed to the extreme parcellation of the agricultural land. According to the census of 1892 there were 5,702,752 farms, with a total area of 122,015,000 acres, distributed as follows:

SIZE OF FARMS	Per cent. of total number of farms	Per cent. of total area under farms
Less than 2.5 acres.....	39.19	2.67
From 2.5 to 25 acres.....	45.90	22.80
From 25 to 100 acres.....	12.48	28.98
More than 100 acres.....	2.43	45.55
Total.....	100	100

These figures show that while the number of small farms is very large, the ownership of the greater part of the land is concentrated in comparatively few hands. Less than 15 per cent. of all the owners possess more than 74 per cent. of all the land. The contrast is even more striking when from this category we exclude those owning comparatively small farms of from 25 to 100 acres; we then find less than 2.5 per cent. of all the owners possessing nearly one-half (45.55 per cent.) of all the land, leaving the remaining half to be divided among 97.5 per cent. of the farmers. Comparing these figures with those of the census of 1882, we find that while there was a slight falling off in the number of farms in the three highest groups, the area in the highest and lowest groups increased, while in the two intermediary groups it fell off. In other words, while the largest estates absorbed still more land, the small independent peasants were losing ground, thereby swelling the number of very small peasants whose holdings—less than 2.5 acres to a

farm—are so small as to compel them to seek additional employment on the large estates. Thus France has not escaped the process of elimination of the medium-size self-sufficing farm, and is slowly tending to the English type of land distribution into large estates and small plots, the latter serving merely as a subsidiary source of income to their owners. The proportion of tenants to owners is not very large as compared with other countries, especially England, the figures being: Those cultivating their own land, 79.8 per cent.; tenants renting land for a fixed money payment, 13.8 per cent.; and tenants working for a share of the crops raised by them on the rented land, 6.4 per cent. Those of the first class, however, cultivate but 60 per cent. of the entire farm area; those of the second, 27 per cent.; and of the third, the remaining 13 per cent.

According to the character of the owners, the land is divided as follows: 2.42 per cent. belongs to the State, 0.02 per cent. to the departments, 8.79 per cent. to the communes, 0.87 per cent. to charitable and other institutions, and 87.9 per cent. to private individuals. The betterment of agricultural conditions in France is elaborately provided for by the National Department of Agriculture. This department has established under one central authority a much more comprehensive and closely coördinated system of agricultural education than is known in America. The schools are adapted to local needs. Not only is instruction in agriculture a branch of the general course in the public schools, but there are practical schools of apprenticeship especially for the training of the peasant laboring class.

FORESTS. The principal forest trees are the chestnut and beech in central France; the oak and cork tree in the Pyrenees; and the fir in the Landes. The pinaster is extensively cultivated along the southwestern coast on account of its usefulness in reclaiming the low seacoast and because of its rich yield of turpentine. The destruction of the national forests has been enormous within the last two centuries, but measures were taken as early as 1827, and especially in recent years, to plant new woods in order to protect those mountain slopes which are exposed to inundations from Alpine torrents. The forests of France at the close of the century embraced 23,749,000 acres, about one-sixth of the total area of the country. Nearly two-thirds of the area under forests is in private hands, while one-third is in the hands of the national, departmental, and communal governments.

MANUFACTURES. For centuries France held a preëminent position as a manufacturing country. She no longer holds that high rank among the industrial nations of the world. The fame of French industry was due to the skill of her craftsmen, which was developed through generations. With the advent of modern industrial appliances, the conditions for the success of which are not so much technical skill as an abundant supply of raw material, especially coal and iron, France was at a disadvantage. Not possessing the natural resources which insure cheap power and industrial operations on a large scale, the country has been tremendously handicapped in the international contest for the world's markets. Those manufactures which are most successfully produced are largely confined to those industries or branches of industries whose

products are noted for their superior artistic finish, and they do not, therefore, come into direct competition with British manufactures. The more important industries are the textile, metal, paper, chemical, glass, and pottery industries. Several other branches of manufacture redound to the fame of France by the elegance and beauty of their products, but they are of minor importance from the point of view of net financial returns. Such are the glove industry of Grenoble and Paris, the Gobelin tapestry, costly shawls, watches, clocks, articles of vertu, carriages, scientific instruments, manufactured mostly in Paris, the matchless china and glass of Sèvres, the fine furniture of Paris and Bordeaux, and many other articles of comfort and luxury. The textile industry is by far the most important, the annual output being valued at about \$600,000,000. This includes woolen, cotton, silk, and linen manufactures, enumerated in the order of the value of their products. The woolen industry employs about 160,000 people in more than 2000 mills, turning out about \$240,000,000 worth of goods per annum. It is carried on chiefly in the departments of Nord, Ardèche, Marne, Somme, Aisne, and Tarn. The more costly of the products of the industry, such as the Paris and Lyons shawls, the Rouen, Roubaix, and Sedan cloths, are in demand all over the world. While exporting enormous quantities of woolen goods, France has to import a good deal of raw wool, owing to the decline of the domestic output. The cotton industry, centring chiefly in the departments of Nord, Vosges, Eure, Aube, and Seine-Inférieure, employed about 150,000 persons at 5,200,000 spindles and 95,000 looms in 1900, as compared with about 100,000 persons and 4,376,000 spindles in 1890. The industry dates in France from 1773. Its annual output is valued at about \$120,000,000. The silk industry, while ranking third in the value of its output, excels in the artistic finish of its products. The annual value of these is estimated at about \$100,000,000. The silk-mills furnish employment to about 80,000 workers. Hand-loom weaving is rapidly declining; the chief seat of this house industry is in the Department of Rhône. In the production of linen goods France leads in the matter of style, quality, and design. The linen industry flourishes chiefly in the north, the name of Lille, Cambrai, and Valenciennes having become identified everywhere with the finest qualities of linen. No less famous are the lace manufactures of Paris, Saint-Etienne, Lyons, and Nantes.

The metal industry is next in importance. While there are large iron and steel mills in the mining region, the departments of Nord, Meurthe-et-Moselle, Loire, and Pas-de-Calais, France is far behind such countries as the United States, Great Britain, and Germany in that field, and has to resort largely to imports of machinery. It is known, however, for the fine qualities of its smaller metal ware, such as safes, hardware, steel pens, locks, files, needles, etc. The excellence of French gold and silver ware is a matter of common knowledge. The manufacture of jewelry, watches, and optical instruments deserves mention. At the opening of the twentieth century the paper industry engaged about 40,000 people in 600 paper-mills, producing some \$60,000,000 worth of goods annually. In 1885 the

number of mills barely exceeded 500, employing about 30,000 workmen and turning out products valued at but \$23,000,000. The manufacture of glass and pottery furnishes employment to some 30,000 people, and the annual output is valued at about \$25,000,000. In addition to the superb china and porcelain ware of Sèvres there should be mentioned the famous mirror-works of Saint-Gobain and Montluçon, and the imitation jewels and glass prisms. The chemical industry ranks probably next to that of Germany, the more important branches from a commercial point of view being the manufacture of perfumes, soap, and candles. Beer-brewing is increasing in importance, the consumption of beer growing at the expense of wine, especially by the poorer classes. From about 185,500,000 gallons in 1880, the annual production of beer rose to over 238,500,000 in 1900. The production of wine has kept pace with vine-growing, and French cognac still leads the world. The tobacco industry is a Government monopoly. The growth of large modern industries may best be seen from the increased use of steam-power, as shown by the following figures: In 1840 the engines and motors employed in the industrial establishments of France, not counting the railways, were capable of developing 2591 horse-power; in 1870 the horse-power exceeded 320,000; in 1890, 863,000; and in 1899, 1,865,000, showing an increase of more than 100 per cent. in the last decade of the century.

TRANSPORTATION. In 1900 the railways of France had a total length of nearly 26,000 miles, Germany and Russia being the only European countries containing a greater mileage. In the same year there were 12.75 miles of line for every 100 square miles of area, which was exceeded by a number of the western European countries, but was twice as great as the corresponding figure for the United States. The railway system of France converges, with the exception of one road, upon Paris as a centre. It consists of six large divisions (not counting the State line), which constitute the great trunk lines of the country. A thorough grasp of these is essential to a clear understanding of the principal economic divisions of the country and their effect upon its industrial and commercial development. These lines are as follows, in their geographic order: the Northern, the Eastern, the Paris-Lyons-Mediterranean, the Southern, the Paris-Orleans, and the Western.

The most important is the Paris-Lyons Mediterranean Railway, running, with its numerous branches, nearly 5600 miles through the richest section of France, connecting the two largest cities of the country, Paris and Marseilles. It commands the traffic of the Rhône Valley as well as that going to and from Switzerland, Italy, and southern Germany. Its capital stock is 4,462,539,247 francs, over \$892,000,000.

The Paris-Orleans Railway extends beyond Orleans to the west and south through Tours to the ports of Nantes and Bordeaux and has its southern terminal at Toulouse, where it joins the Southern Railway. It passes through a rich agricultural country, serving as an outlet for its products, which it takes to the Atlantic ports just mentioned, to the Mediterranean through the Southern Railway, and to Paris and the northern region of France. Its total length is about 4500 miles, and the capital stock 2,273,-

\$12,946 francs (about \$455,000,000). The Southern Railway is the only trunk road that does not terminate in Paris. It traverses the south of France from east to west, joining the two roads just described. The principal terminals of the line are Bordeaux, on the Atlantic, and Cette, on the Mediterranean. At the latter point it joins the Paris-Lyons-Mediterranean line, and connects at Perpignan and Bayonne with the railways of Spain. It is the shortest trunk line in France, its length being about 2200 miles, and capital stock 1,046,016,767 francs (about \$200,000,000). The Northern Railway, extending from Paris northeast to the Belgian frontier and northwest to the ports situated on the English Channel, passes through the richest mining region of France. It handles the traffic with England and Northern Europe and has terminals in the ports of Dunkirk, Calais, and Boulogne, besides passing through the important textile centres of Lille, Cambrai, Valenciennes, Arras, etc. It is about 2300 miles long, with a capital stock of 1,649,642,669 francs, or about \$330,000,000.

The Eastern Railway covers the territory lying between the Northern and the Paris-Lyons-Mediterranean Railways. It is of great strategic value, since it extends directly east of Paris toward the German frontier. Though not connecting the same terminals, it competes with the two railways mentioned above, since it carries traffic to Belgium and northern Germany over Mézières, to Switzerland over Belfort, and to South Germany over Nancy. It has a length of about 2800 miles and a capital stock of 2,083,753,828 francs (about \$417,000,000). Finally, the Western Railway, extending from Paris over the northwestern and western parts of France, terminates in a number of ports on the English Channel and the Atlantic, notably Dieppe, Havre, Cherbourg, Saint-Malo, and Brest. It is in a position to compete with the two adjoining roads, the Northern on the northeast, and the Paris-Orleans on the southwest. Its length exceeds 3700 miles, and its capital stock is 1,943,015,204 francs, or more than \$588,000,000. The State railways cannot be said to form a trunk line, since they are not all contiguous, but form an irregular, broken net, intersecting at many points the other roads. Their length is about 1700 miles. The roads of France will thus be seen to cover each a distinct territory, distinct both in the sense that each territory is traversed by one road only and that each forms a distinct economic entity. The Northern road may be called a coal-carrying line, the Paris-Mediterranean a carrier of finished products, and the Paris-Orleans a grain-carrier.

The operation of Government and private railways side by side is the result of a long series of experiments. Since 1842, when the first law regulating the construction and operation of railways went into effect, the country has passed through a number of stages, each having its effect on the railways. The present status is the result of the law of 1883, which left the principal lines in private hands, but under strict Government control. According to the charters of the railways, their franchises expire between 1950 and 1960, when the entire railway property will pass to the State without any compensation. The Government, in 1883, turned over nearly all of the lines to private companies

without any compensation. New construction is done by the Government, the companies being assessed for the purpose 25,000 francs per kilometer, a little over \$8000 per mile, about one-tenth of the actual cost. For the remainder the companies advance the money to the Government, which the latter pays out in annuities at a certain rate of interest, after deducting the amounts due to it for sums advanced to the railways for the payment of dividends. The State guarantees a minimum dividend to the stockholders. In the event of inability of a road to declare the minimum dividend on the capital stock, the State advances the required sum, which, with the accrued interest, goes to make up the debt of the road to the State, payable from the profits of succeeding years. When the profits exceed a certain rate (which varies with the different roads) the Government is to receive two-thirds of the surplus. From 1883 till 1893 the deficits continued to increase, rising from 28,000,000 to 95,000,000 francs; but since 1893 they have been steadily diminishing, so that in 1899 they were only 9,000,000 francs—two roads only, the Western and the Southern, recurring to Government aid during that year, as against three in 1898 and four in 1897. The growth of railways has been as follows:

	Miles
1850.....	1,916
1870.....	11,140
1890.....	22,925
1900.....	26,370

ROADS. The French highroads have world-wide fame. The laying of the first is attributed to Philip Augustus, and their more perfect organization during the sixteenth and seventeenth centuries was due to Henry IV. and Louis XIV. According to the authorities charged with their maintenance, these roads are divided into three kinds: national, departmental, and communal.

COMMERCE. The general commercial policy of the French Government was that of protection during the entire nineteenth century, changing from the high tariff of 1816 to the more liberal one of 1860. The unfortunate condition in which France found herself after the war of 1870-71 demanded higher tariff duties for fiscal purposes, but, owing to existing treaties with other countries, they could not be introduced before 1882, when a new general tariff was adopted raising the duties about 25 per cent. Treaties for a term of ten years terminating in 1892 were entered into with most of the European countries, of which Germany, Russia, Turkey, and Rumania enjoyed the privilege of the 'most favored nation' clause. Subsequent changes in the tariff have all been designed to make it more prohibitive. The table below shows the development of commerce during the latter half of the century:

YEAR	Imports, francs *	Exports, francs *
1860.....	1,897,000,000	2,277,000,000
1870.....	2,867,000,000	2,802,000,000
1880.....	5,033,000,000	3,468,000,000
1890.....	4,387,000,000	3,753,000,000
1900.....	4,698,000,000	4,109,000,000

* A franc equals 19.3 cents.

As the table shows, the tariff has crippled the import trade. As to the exports, they are on

the increase, although the growth has been rather slow, owing partly to retaliatory restrictions imposed upon French commerce by other countries and partly to the industrial condition of France. The dependence of France upon foreign countries for her supply of coal and raw material is shown by the fact that these constitute nearly 65 per cent. of the total imports, while manufactured products make up only 18 per cent. As explained above under *Manufactures*, because of the different nature of the products, France does not compete with Great Britain, the United States, and Germany in the world's trade, where the demand is largely for cheap machine-made goods. As France sells a large proportion of expensive goods, and buys great quantities of cheap, bulky raw materials, vessels in the French trade often find it difficult to get full return cargoes from French ports.

The chief articles of import in the order of their importance are: wool, coal and coke, raw cotton, raw silk, oil-seeds, wool and timber, wine, cereals, etc.; the chief articles of export are textiles (silk, woolen, and cotton, the silk leading), wine, raw wool and yarn, linen, clothing, raw silk and yarn, leather and leather goods, skins and furs, metal goods and tools, chemical products, etc. Manufactured products constitute more than one-half of the total exports, while raw materials constitute about one-fourth. The principal countries to which France sends products are: The United Kingdom, nearly 30 per cent. of the total; Belgium, about 14 per cent.; Germany, 11 per cent.; Algeria, 6 per cent.; United States, 6 per cent. The United Kingdom ranks first also among the countries on which France draws for imports, about 14 per cent. of the total; next come the United States with a little less than 11 per cent., Germany with 9 per cent., Belgium with less than 9 per cent., followed by Argentina and Russia.

The course of trade between the United States and France in the last quarter of a century may be traced in the following table:

YEAR	Imports into the U. S. from France	Exports from the U. S. to France
1875.....	\$36,708,600	\$51,029,200
1891.....	76,688,793	60,693,190
1893.....	76,076,215	46,619,138
1896.....	61,580,509	45,149,137
1897.....	67,530,231	57,594,541
1899.....	62,146,056	60,596,899
1900.....	73,012,085	83,335,097

SHIPPING AND NAVIGATION. The French merchant marine employs more than 80,000 persons. In 1899 it consisted of 1227 steamers, of 507,120 tons capacity, and 14,262 sailing vessels of 450,636 tons, as against 1066 steamers of 492,684 tons and 14,128 sailing vessels of 440,051 tons in 1889, and 599 steamers of 277,759 tons and 14,406 sailing vessels of 641,539 tons in 1879. More than 100,000 vessels, with an aggregate capacity of 25,000,000 tons, enter the French ports annually; about four-fifths of these are French, but their tonnage barely amounts to one-half of the total. Marseilles and Havre are far in advance of other French ports both in tonnage and the value of their shipping; the other leading ports are Dunkirk, Bordeaux, Rouen, Boulogne, Saint-Nazaire, Cette, Calais, and Dieppe. A Gov-

ernment subsidy of \$5,000,000 is granted annually to French shipping interests.

France is covered with a network of navigable canals, which afford a splendid means of inland water communication. The total length of the canals is about 1242 miles.

WEIGHTS, MEASURES, AND MONEY. The metric system is the only one used throughout the country and its dependencies. There is a double standard of money, the silver being given an arbitrary value in proportion of 15½ to 1 of gold. However, there is no free and unlimited coinage of silver. By the agreement of the Latin Union, which embraces besides France the countries of Belgium, Italy, Switzerland, and Greece, the coinage of silver in each of these countries is limited. For France in 1897 the amount was 394,000,000 francs. The unit of money is the franc, equal to 19.3 cents, United States gold money. The franc has 100 centimes. The coins in use are the 10 and 20 franc gold coins; the silver coins of 1, 2, and 5 francs and of 20 and 50 centimes; and the bronze 5 and 10 centime coins.

BANKING. The French banking system has in many respects served as a model for other nations. Of late years banking and financing operations generally have acquired a greater relative importance in the economic activity of the country than before, since through that channel the surplus capital of French citizens is directed into productive fields in foreign countries. With the exception perhaps of England, France holds the leading position in the world for the amount of foreign investments. There are two distinct classes of financial institutions to be considered here: (1) The Bank of France, which stands by itself; and (2) other banking institutions. The *Banque de France* is a private institution, managed under strict Government control, owing to the important Government functions intrusted to it. This control is exercised not only by general legislative provisions, such as govern all other banks, but also directly through the governors and under-governors of the bank, who are appointed by the Government. The governor can exert a veto power over the actions of the bank by refusing to sign the decisions of the General Council, which represents the stockholders. In addition to its general banking function, such as receiving and lending money and keeping accounts with private individuals, the bank conducts all the money operations of the public Treasury, and has the sole power of issuing paper money. It was founded in 1800, and passed through many changes, following the stormy events of the nineteenth century. Its present form of organization and basis of operation date from the charter of 1857, renewed in 1897, and expiring in 1920. The maximum issue of paper money is limited to 5,000,000,000 francs (\$1,000,000,000). The State regulates, through the veto power of the governor, the ratio of metallic reserve to the notes in circulation. In return for the privilege of the exclusive power of note issue and of being the depository of all the public funds, the bank performs gratis all the fiscal services in connection with the keeping, transferring, and disbursing moneys on behalf of the Treasury. In addition to that it keeps open to the State at all times a credit of 180,000,000 francs (\$36,000,000), free of interest or any

other charges. In addition to all taxes to which other banks are subject, it pays a stamp tax on the note circulation. Its capital stock is 182,500,000 francs (or \$38,500,000), and at the close of the century its principal resources and liabilities were as follows: Metallic reserve, \$608,000,000 (advances for public works, about \$100,000,000); loan to the State, \$36,000,000 (securities and real estate, \$40,000,000; note issue \$800,000,000); State funds on deposit, \$68,000,000; individual deposits, \$105,000,000.

The other principal banking institutions are the Crédit Foncier, capital stock, \$34,000,000; Crédit Lyonnais, \$20,000,000; Banque de Paris et de Pays-Bas, \$12,500,000; Société Générale, \$12,000,000; Société Financière Lyonnaise, \$10,000,000; and a number of banks with a capital of less than \$10,000,000. The Paris Clearing House (*La Chambre de Compensation des Banquiers*), unlike the New York or London houses, plays an insignificant rôle. It was founded in 1872 after the London model, and although much had been expected of it, has not proved a success, owing to the reluctance of the French people to use checks. The use of checks is limited to very large transactions, and even in those cases is not always the rule. Savings banks thrive and flourish in France in great numbers. The first savings bank was established in Paris in 1818; in 1840 there were 430 such institutions, with deposits exceeding \$38,000,000; at the close of the century the private savings banks numbered 547 (with 1244 branch offices), the deposits exceeding the sum of \$680,000,000, credited to nearly 7,000,000 depositors. In addition to that 3,564,464 depositors had at the end of 1900 over \$200,000,000 in the Government postal savings banks. The latter were founded in 1881.

FINANCES. The characteristic features of French finances are: the largest public debt of any nation in the world, both absolutely and relatively; great and rapidly growing expenditures; and heavy taxation, which nevertheless frequently leaves a large deficit, leading to fresh borrowings.

REVENUES. The revenues of the Republic are derived from two sources, taxation and State properties and monopolies. The financial system resembles more that of the United States, differing greatly from those of Great Britain and Germany in the great preponderance of indirect over direct taxes, and in the absence of an income tax. Only about one-fourth of the revenue derived from taxation comes from direct taxes, and three-fourths from indirect. In Great Britain the proportion of direct taxes to the total tax revenue is about 40 per cent., while in Prussia it is as high as 71 per cent. The revenue derived in France from all kinds of taxes constitutes about 80 per cent. of the total, the remaining one-fifth being the income from Government properties and monopolies. The more important of the direct taxes are those on real estate and buildings, taxes on property in mortmain, on royalties from mines, trade licenses, and such objects of personal use as carriages, horses, bicycles, etc. Among the indirect taxes the most important are the registration tax, contributing more than one-fourth of the total revenue from indirect taxes; customs duties, yielding more than a fifth; the tax on sugar, about one-tenth; the stamp duty, with about one-eighth of the total indirect revenue; and a large number of excise duties on various

articles of consumption, such as liquors and wines, salt, candles, vinegar, the tax on railway tickets, etc. Bearing in mind that the incomes from a number of the State monopolies are practically indirect taxes, as e.g. in the case of tobacco and matches, it becomes apparent that the French consumer is heavily taxed on nearly everything he eats, drinks, wears, and enjoys; since the department and commune taxes cover nearly everything that the national Government leaves out, from doors, windows, and dogs, to every article of food that gets to the consumer from the country. The most important revenue from Government monopolies, in addition to those mentioned, are those derived from State railways, the operation of the mint, public domain, and forests.

EXPENDITURE. The chief item of expenditure is the service of the public debt, \$250,000,000, which absorbs considerably more than one-third of the total revenue of the Government. The next largest item is for the War Department, over \$140,000,000, or nearly one-fifth of the total; the Marine follows next, with an expenditure one-half as large; after which come the departments of Public Works, Finance, Public Instruction, Posts and Telegraphs, Colonies, etc.

The total revenue of France increased from 2,705,000,000 francs in 1875 to 3,428,000,000 in 1895, and 3,554,000,000 in 1901, the expenditures for the same years being respectively 2,980,000,000 francs, 3,510,000,000 francs, and 3,554,000,000 francs.

PUBLIC DEBT. The public debt is the natural result of continued deficits in the national budget, and dates from the fifteenth century. In 1901 it exceeded \$6,000,000,000, as compared with less than \$3,500,000,000 for Great Britain, \$3,250,000,000 for Russia, \$2,500,000,000 for Italy, \$1,327,000,000 for the United States, \$1,500,000,000 for Prussia. The indebtedness per capita, more than \$150 in France, is far beyond that of any other country. The following table shows the growth of the French national debt and the annual interest charge it involved in the course of the nineteenth century:

YEAR	Principal, mill. of francs	Interest, mill. of francs
1800.....	714	36
1815.....	1,272	64
1830.....	4,426	199
1848.....	5,913	244
1852.....	5,516	239
1871.....	12,454	386
1889.....	21,251	739
1899.....	29,948	1,266
1901.....	30,097	1,243

COLONIES. Considered from an economic point of view, the French colonial system has gone through four stages since its inception in the sixteenth century. Previous to the Revolution the colonies were administered with a view to the greatest possible profit to the ruling country. In 1825 a change of policy was inaugurated tending to secure to the colonists a large measure of self-government. This condition lasted until 1841, when many of the liberties previously granted were revoked, and a stricter financial control by the Government introduced. In 1854, however, the colonists acquired considerable independence in fiscal matters. While the home Gov-

ernment reserves control in some matters, it makes itself responsible for the expenses involved, the most important of which are the support of the army and navy, the salaries of the various Government officials, and the maintenance of prisons. The right of the colonies to impose their own tariffs was withdrawn in 1892. That the French colonies have not proved a paying investment may be seen from the following figures: in 1900 the expenses for the colonies amounted to nearly 90,000,000 francs, Algiers and Tunis excepted. In addition the Government paid out 23,500,000 francs in ship subsidies, making a total of about 115,000,000 francs, against about 8,000,000 francs of colonial receipts. The French taxpayer is thus made to contribute more than 100,000,000 francs annually for the maintenance of French control over the dependencies.

As far as the budgets of the colonies themselves are concerned, the colonies are allowed free play in the method of raising their revenue, except the right of fixing the tariff duties; but in the matter of expenses there are certain items, called obligatory expenses, for which each colony must make provision in its budget. The obligatory expenses include, among others, the payment of the debt, the maintenance of the Government buildings, a part of the maintenance and salaries for public instruction, police, insane, and poor children. In a recent work on the French colonial system Professor Seligman thus sums up the fiscal policy of France toward her colonies: "The French Government wavers between two lines of policy. On the one hand, the movement toward local autonomy has granted the colonies substantial rights of fixing their own sources of revenue and expenditure in accordance with the dictates of local expediency. On the other hand, the movement toward centralization or so-called assimilation has taken away from the colonies the privilege of levying their own tariffs, and has imposed upon many of the dependencies a system of taxation more suitable to the interests of the mother country than to those of the colonies themselves; has declared certain of the colonial expenditures obligatory, and finally has complicated the relations between the colonies and the home Government by a series of subventions on the one hand and of contingents and contributions on the other. The most recent and enlightened colonial administrators themselves plead, not only for a simplification of the relations between the colonies and the home Government, but also for a larger share of independence and initiative on the part of the colonies themselves." As to the benefit derived by France from her colonies, the following table throws some light on the question, though it is to be noted that some of the figures which enter into the summarized item "all others" for the year 1896 were taken from earlier years:

The development of trade shown by the table also continued into more recent years, the exports into France in 1899 amounting to 461,000,000 francs, and the exports from France to the colonies for the same year 477,000,000 francs. France controls a somewhat larger portion of the commerce of its colonies than Great Britain does of the trade within the regions which constitute a part of the Imperial domain. In general, the trade of the more recently acquired possessions is carried on to a smaller extent with France than is that of the older colonies, France having about nine-tenths of the trade with Réunion, but only one-tenth or less of the large trade of Indo-China. A considerable part of the French imports into the colonies is at the expense of the mother country, and consists of supplies for the troops, equipment material for various Government institutions and undertakings, and nearly one-fifth of the entire imports from France are made up of goods coming originally from foreign countries.

POPULATION. The following table shows the population of France in 1891 and 1901 by departments, and its area in square miles:

DEPARTMENTS	Area	Population	
	English sq. miles	1891	1901
Ain.....	2,248	356,907	350,416
Aisne.....	2,866	545,493	635,583
Ailier.....	2,848	424,382	422,024
Alpes (Basses).....	2,697	124,285	115,021
Alpes (Hautes).....	2,178	115,522	109,510
Alpes-Maritimes.....	1,443	258,571	293,213
Ardèche.....	2,144	371,269	353,564
Ardennes.....	2,027	324,923	315,589
Ariège.....	1,892	227,491	210,527
Aube.....	2,326	255,548	246,163

France is exceeded by many European countries in density of population, her figure of 188 people per square mile being only about one-third of those of Belgium and England, and far below those of Italy and Germany. It is, however, nearly seven times as large as that of the United States (exclusive of Alaska) in 1900. At the beginning of the nineteenth century Russia was the only European State that exceeded France in number of inhabitants. The population continued to grow rapidly until about the middle of the nineteenth century; since then the rate of growth has been remarkably low. While France in the last half of the nineteenth century gained only 2,858,127, the population of Germany gained over 21,000,000, Great Britain nearly 14,000,000. Most of the other European countries also made large gains, France falling to fifth place among European nations. This fact has given rise to serious apprehensions on the part of French statesmen, and furnished a fruitful topic of discussion to economists and publicists among all nations. The following table shows the growth of population in France during the nineteenth century.

The decline of population between the census of 1866 and of 1872 was 1,964,173, of which 1,597,228 was due to the loss of the different territories annexed to the German Empire. The remainder was due partly to losses in the war, and partly to an absolute decrease in the population

in 73 departments. Between 1881 and 1886 there was a loss of population in over one-third of the departments. From 1886 to 1891 the decline of

FRANCE DURING THE NINETEENTH CENTURY

YEAR OF CENSUS		Number of Population
1801.....	[26,930,756]	27,349,003
1821.....	[29,871,176]	30,461,875
1841.....	[33,400,864]	34,217,719
1861.....	[35,844,902]	37,382,225
1866.....	[36,495,489]	38,067,094
1872.....		36,102,921
1881.....		37,672,048
1891.....		38,342,948
1901.....		38,961,945

(The figures in brackets denote the population of that part of the country which constitutes the present territory of France.)

population spread over a wider area, so that the census of 1891 recorded 55 departments with a decrease in population, and only 32 with an increase. Between 1891 and 1901 there was a further decline in 62 departments, against an increase in only 25. Although the aggregate increase has been invariably greater than the loss, leaving a small gain for the country as a whole, yet the percentage of increase per decade did not hold its own during the last thirty years of the nineteenth century, and the area of declining population has been continually enlarging. The chief cause for the unsatisfactory state of the population is found in the steadily declining birth-rate. The latter is lower than in any European country, and was as follows in the last three decades of the nineteenth century: Births per 1000 living: 1871, 22.6; 1875, 26.0; 1880, 24.2; 1890, 21.8; 1900, 22.4.

Of 10,845,247 families in France recorded by the census of 1896, 6,826,850, or 63 per cent., had from none to two children; in the case of 2 per cent. of the families the number of children was unknown, and 35 per cent. had three or more children. The two largest groups were those with one and two children, constituting 24.6 and 22 per cent. of the total respectively. On the other hand, the death-rate in France is among the lowest of civilized nations. In the decade of 1861-70 the annual death-rate per 1000 living persons was 23.6; in 1871-80, 23.7; 1881-85, 22.2; 1890, 22.8; 1898, 21.2. In spite of the low death-rate, there was an excess of 25,988 deaths over births in 1900. One of the chief causes of the decline of population in several departments is the concentration of population in large cities. The urban population is rapidly gaining at the expense of the rural. The change in proportion of the two was as follows in the last half of the nineteenth century:

	Population	
	Urban, per cent.	Rural, per cent.
1846.....	24.4	75.6
1851.....	25.5	74.5
1861.....	28.9	71.1
1872.....	31.1	68.9
1881.....	34.8	65.2
1891.....	37.4	62.6
1896.....	39.1	60.9

Thus we find the urban population increased in fifty years from one-fourth of the total to nearly 40 per cent., the rural dropping from

three-fourths of the total to about three-fifths. In 1896 there were 12 cities with a population each of more than 100,000; in 1901 there were 15 such cities, the inhabitants having increased from 4,876,867 in 1896 to 5,377,486 in 1901, or 10 per cent. The following are the fifteen largest cities of France, and their population in 1851 and in 1901:

	1851	1901
Paris.....	1,053,262	2,714,068
Marseilles.....	185,062	491,161
Lyon.....	156,169	459,009
Bordeaux.....	123,935	256,638
Lille.....	68,463	210,696
Toulouse.....	85,554	149,841
Saint-Etienne.....	53,741	146,559
Roubaix.....	31,038	142,366

Nice.....	46,683	105,100
Nancy.....	40,289	102,559
Toulon.....	45,510	101,602

The movement of emigration and naturalization is too small to have any very appreciable effect upon the population of the country. The immigration exceeds the emigration, the total number of foreign-born persons in France in 1896 being 1,051,907, of whom the greater number came from Belgium and Italy. According to employment, one-fifth of the people are returned as employers, a somewhat larger proportion as workmen and clerks, less than 5 per cent. as domestic servants, and about one-half of the people as members of families dependent on those enumerated in the above groups. By occupation the people (including those depending upon the head of the family) were distributed as follows, according to the census of 1891: agriculture, 17,435,888; industry, 9,432,560; transportation, 1,199,333; commerce, 3,961,496; public employment, 1,415,235; professions, 1,114,873; private fortune, 2,169,750; unclassified, 1,304,250.

ETHNOLOGY. The perspective of history reconstructed by ethnologists is more continuous in France than in any other country. In blood the French combine many races, prehistoric Teutonic blond long-heads, Alpine or Celtic short-heads, and Mediterranean brunette long-heads. The stature of conscripts is given as 1.646 meters and the general cranial index at 83.4, ranging from 75 to 88. But anthropometric characteristics have to be studied with caution, since the tall, light-complexioned type, with blue or gray eyes, predominates in the north; the short-headed, brunette type, marked by dark eyes and low stature, prevails in the middle and south; and the Mediterranean type, brunette, dark-eyed and short, occurs in parts adjoining Italy and Spain. The southern French may be called 'Iberio-Celtic' and the northern French 'Teuto-Celtic,' the language of both being Italic. A retrospect of French ethnology includes: (1) The modern period of racial coalescence since the Crusades, embracing also nationality and speech; (2) incursions of Saracens (arrested by Charles Martel, A.D. 732), Burgundians, Franks (who gave their name to the country), and Visigoths, the last three being Teutons; (3) the Roman conquest and all that it means in racial mixtures, no less than in sovereignty and speech; (4) the earlier settlements of Belgian long-heads, Celts, or Gauls, and Aqu-

tanian and Ligurian brunettes; (5) Semitic and Pelasgian settlements, made by Phœnician and Greek colonists, of little account, however, to the ethnologist; (6) the peoples of the earliest Iron and the Bronze Age, with a variety of skull types; (7) the Neolithic authors of menhirs and dolmens, exhibiting intermixture of brachycephals and dolichocephals; (8) the Laugerie-Chancelade or Cro-Magnon and the Neanderthal or 'Spy man,' Paleolithic dolichocephals, contemporaries of the cave bear, mammoth, and reindeer, and back of that, the rudest stone ages, when men are alleged to have lived with the mastodon and *Elephas antiquus*. France has experienced in this long stretch of time and evolution of culture the whole range of climates in which man can exist, ranging from arctic to tropical, together with their fauna and flora.

EDUCATION. Since the Franco-Prussian War the subject of education has been one of intense interest to the French people. In this respect France has probably exhibited a greater zeal than any other European country. The Republic has considered it of first importance that it should fortify itself with an enlightened citizenship. Accordingly, every grade of education has been subjected to a transformation that has been almost revolutionary. In the years 1881-82 were passed compulsory-attendance laws and laws abolishing tuition-fees. Prior to that time the educational system had been more or less dominated by clerical influence, the Catholic religion being taught, and a large number of the clergy having representation on the teaching staff. The influence of clericism was thought to be detrimental to the strengthening of republican ideals and institutions. Consequently the educational reforms assumed a religious phase, and have been more bitterly contested than in any other European country. In 1882 the teaching of religion in the schools gave way to the teaching of morals, and by a law of 1886 teaching in the public schools was limited to lay teachers, and schools in which religion was taught received no aid from the Government. The dissatisfaction on the part of some with this secularization of the schools was shown in the subsequent growth of the clerical *lycées* and colleges at the expense of the State schools of the same rank. The matter became of grave concern to the Government. In its desire to lessen the attendance at the religious schools, and thereby forestall the hostile influence which was presumably fostered by them, the Government secured the adoption of the Associations Bill, which went into effect in 1902, according to which many religious associations were obliged to dissolve their schools likewise. By a second law which made three years' preliminary study in the State school a prerequisite to securing an official State position or to entering a special school, the Government practically excluded graduates of clerical schools from admission to some of the leading professions.

The public system of education begins with the kindergarten or *écoles maternelles*, which admit children from the ages of two to six years. In addition to giving kindergarten instruction, they serve the function of infant schools where care may be given to children of the laboring classes. The establishment of these schools is optional with the communes. The attendance in 1899-1900 was: Public—chiefly lay—458,278, and pri-

vate—chiefly clerical—288,839. Next are the lower primary schools, the attendance of which is compulsory for children between the ages of six and thirteen (if not receiving instruction elsewhere), or until they have passed the examination for the completion of the course, which many of them do before the end of the compulsory time requirement. The instruction, as in the higher schools, is given to the sexes separately. In 1899-1900 the attendance at the public primary schools was more than three times that of the private primary schools, and the number of children not receiving instruction was very small. The total number of children in the primary schools in 1899-1900 was 5,530,232, of whom 1,250,562 only were in the private clerical schools. The system has resulted in greatly reducing the illiteracy of the country, as is shown from the fact that in 1880 the per cent. of illiterates among conscripts was 14.4, while in 1897 it was only 5.1.

The secondary schools include State classical colleges (*lycées*), supported by the State, and communal colleges, supported by the communes, though aided by the State, for boys, and schools of similar rank for girls. In 1900 the *lycées* for boys numbered 109, and the communal colleges 229, with a total enrollment of 85,599. In the same year the non-State clerical schools of the same rank had an enrollment of 91,825, and the lay schools enrolled 10,182 pupils. The course of instruction covers five years, the most usual age of students being 13 to 18. The establishment of the communal colleges is optional with the commune. The secondary schools award the bachelor's degree. The boys' *lycées* were formerly classical institutions, Latin and Greek occupying the principal place in the curriculum. In 1902 an elective system was introduced, making it possible to take either a modern-language course or a science course, intended to prepare for a more practical career. Also, four distinct courses are at the option of the student, but he cannot change from one course to another, or exercise any range of choice within the course selected. All courses lead to the same degree, and confer the same privileges, and a degree may now be secured without the study of Greek and with only a minimum of Latin. History, civics, and ethics receive special emphasis, and the practical point of view is emphasized in the teaching of all subjects. The girls' *lycées*, however, from their introduction about 1881 took little notice of the ancient languages, but emphasized rather the French language and literature. The convents still have the patronage of a majority of those taking secondary courses, but the number who attend the newly established *lycées* is rapidly increasing, being 11,994 in 1899. Many of the secondary schools are attended by both boarding and day students. A large number of the more intelligent students are assisted by a system of fellowships. Graduation from the secondary schools—public or private—is a prerequisite to securing the ordinary degree from the universities.

The interests of higher education are subserved by the fifteen State universities and by various governmental and private special schools. From 1803 to 1896 the universities of France were deprived of their autonomy, and were little more than degree-conferring groups of faculties. In 1896 their autonomy was reestablished. The fifteen universities are: Paris, Lyons, Toulouse,

Poitiers, Rennes, Nancy, Montpellier, Aix-Marseilles, Bordeaux, Dijon, Lille, Grenoble, Besançon, Caen, and Clermont-Ferrand. The faculties of the universities are paid by the State, but the universities are otherwise dependent upon the local community or upon private munificence. Numerous benefactors by their liberal gifts have shown an interest in the welfare of the universities. The response of local communities must naturally vary enormously, and there is therefore a great inequality in the size and prosperity of the different institutions. Those located in large and wealthy cities, like Paris or Lyons, have a great advantage over those in smaller towns. The enrollment in the University of Paris in the year 1900 was 12,193—nearly three-sevenths of the total attendance at the State universities. The French universities attract the most students of medicine and law, the number exceeding the total taking corresponding courses in German universities. The conditions upon which degrees were formerly conferred made it difficult for a foreign student to secure them, but with the new regulation introduced in 1897 degrees are more easily obtained, and there has consequently been a very large increase in the number of foreign students.

Besides the universities there are a large number of special schools, both Government and private, covering almost every phase of science and art. The movement toward a more modern technical course of instruction has permeated the school system, having even entered the classical *lycées*, and in no other country do the provisions afforded for preparing for the practical affairs of life equal those of France. Special emphasis is given to instruction in commerce, agriculture, etc. Theological instruction is amply provided through schools established for that purpose. Finally, the advancement of knowledge is sought through the organization known as the Institute of France (*q.v.*), whose five academies embrace in their scope every phase of learning.

The administration of the educational system in France is characterized by an unusual centralization and coordination. The highest educational officer is the Minister of Education, who holds a position in the Cabinet. He is actively assisted by a Superior Council of 58 members, while a second council exercises advisory powers only. The whole State system is divided into superior, secondary, and primary departments, with a director responsible to the Minister at the head of each. For the administration of education France is divided into sixteen districts called academies, and the civil departments serve as subdivisions for each of these. At the head of each *académie* is a rector, and at the head of each department an academy inspector, the latter receiving his appointment from the Minister. Subordinate to the academy inspectors are the primary inspectors—about 450 in number. The prefect of the department, assisted by a council, appoints teachers from the approved list, submitted by the inspectors. The mayor and council of the communes are responsible for school property. The State pays all expenses for teachers, administration, and inspectors of the entire educational system; the departments pay for the erection and furnishing of normal schools, and the communes pay for the erection and furnishing of the local elementary schools. The total expenditure for

public primary schools is increasing from year to year, being estimated at \$6.05 per capita enrolled in public primary schools (including infant schools) in 1881-82 and at \$9.20 in 1896-97. This estimate does not include the interest paid on moneys advanced for school buildings, which, if included, would raise the per capita expenditure for 1897 to \$11.20.

The educational system provides particularly also for the preparation of teachers. Separate normal schools for the training of teachers for the elementary grades are provided in each civil department for men and women, at which tuition, board, rooms, and books are all free. Teaching is now a profession in France. Each normal student pledges himself to teach ten years, and all candidates for schools must hold normal certificates. Besides the elementary normal schools there are a higher normal school, intended to qualify for inspectorships and other positions of high rank, and another normal school for kindergarten teachers. The supervision of the school is in charge of the primary inspector (serving under the department inspector), who is judge of the teacher's proficiency, and upon whose recommendation depends the teacher's advancement or degradation. The schools have no position corresponding to that of superintendent or principal in the American schools. After serving the requisite time teachers are allowed to retire on a pension. The system is noteworthy in that it secures a high grade of teachers for country districts, inasmuch as the salary depends upon proficiency and is paid by the State, although the commune may supplement this from local funds, as is not infrequently done.

The French educational system seems to have failed to meet the educational needs of the country in one important respect. As compared with most of the American States, the number of pupils who continue their work into the secondary schools is small. Inasmuch as the children are yet young when they finish the primary course, there is a period in their lives when they are likely to be unoccupied, and the benefits lost of the education already acquired. France has become aroused to the need of further educational provision for the adolescent and adult periods of life, and the establishment of some form of night schools has been undertaken with remarkable success. Very little, however, has been contributed by the Government for their support, their introduction and maintenance being largely in the hands of societies and organizations. These schools are sometimes in the nature of continuation schools, but they take their form from the local needs, and sometimes follow more nearly after the style of university extension work, or of the illustrated lecture. In 1897-98 those taking courses in adult schools (popular lectures not being comprehended in these) numbered 378,000 men and 105,000 women.

RELIGION. All religions in France are tolerated, and since the decree of Napoleon I. in 1802 Catholic, Protestant, and Jew receive State aid, Mohammedans being similarly favored in Algeria. The amount of the State grants varies but little from year to year. the appropriation in 1902 being: for Roman Catholic worship, 40,990,923 francs; Protestant worship, 1,495,100; and Jewish worship, 206,530. Administration and other costs amounted to 291,000 francs.

No religious census of France has been taken

since 1872, and exact estimates of the numerical strength of the different religious faiths are misleading. It may be said, however, that about three-fourths of the people are, at least nominally, Roman Catholics. The indifference to the Church manifested by a large number of members, and the radical opposition to the Church and to all religions by non-members, and the resulting policy in regard to the Church, has brought upon France the charge of being an agnostic nation. The source of the opposition is generally considered to be of an historical and political nature. The relation of the Church with regard to the despised social order prevailing in pre-Revolution days is still charged against it. It is suspected of being out of harmony with republican ideals and institutions, and of being intent upon grasping power to use against the present form of government. This charge is directed particularly against the religious associations. The intimate relations of these organizations with the Vatican presumably make their interests clash with those of the Republic. During the French Revolution religious orders were disbanded and the enormous wealth they had accumulated was largely confiscated. But they have since reestablished themselves, and have become three times as numerous as before the Revolution, there being, in 1901, 3216 establishments for men that were recognized by the Government, comprising a membership of 30,136; while there were 2870 recognized and 13,428 unrecognized establishments for women, with a total membership of 129,492. A large part of these were engaged in educational work, which was naturally one of the most potent agencies for the spread of their influence. Their wealth had likewise accumulated, and they entered extensively into various kinds of commercial enterprise, which gave them another vantage ground for the exercise of their influence. Moreover, by virtue of their standing at Rome they were supposed to have practical control over the regular clergy and the main body of the Church, whose sympathies and influence would otherwise presumably be more favorable to democracy. Opposition to the Church and the fostering of agnostic propaganda is generally supposed to centre in the Free Mason and the Socialistic elements of the population, and these factions on the one extreme and the ardent clericalists on the other are pitted against one another. In 1882 the opposition to clerical influence secured the abandonment of religious instruction in the public schools, and in 1886 the prohibition of clerical members from holding positions in them. These measures were followed in 1901 by very radical laws, directed particularly against the religious associations. According to these, all associations must be authorized by the Government, and those found to violate the law, or to be detrimental to the republican form of government, or to good morals and order, were to be dissolved. Parliamentary consent is necessary to the formation of associations which have foreign directors or a foreign domicile. It was declared that the public welfare should be considered, both in an abdication by the individual of his rights as such, and in a renunciation of the exercise of the natural faculties, such as occurs, for instance, with the taking of the vows of celibacy. It was especially intended that the law should operate against the continuance of the association schools, and it was further provided that members of dissolved

Orders could not teach until their membership with the Order was terminated.

The opposition to Catholicism has not resulted in a strengthening of Protestantism, nor, though there are occasional defections on the part of the clergy, is there any general movement within the Church to break with Rome, such as exists in Austria. The number of Protestants is actually diminishing, and it is thought to have lost considerably over one-third of its membership since 1835 (making allowance for the dismemberment of Alsace-Lorraine), the number at present being about 600,000. At the same time the influence of Protestantism under the present Government is probably out of all proportion to its numerical strength, as is evidenced by the large number of its representatives who are leading governmental officials. The Protestants are most numerous in the south of France, particularly in the Department of Gard. There are two branches of the Protestant Church, the Calvinistic and the Lutheran, the former containing the large majority of the Protestant population. The Jews are supposed to be decreasing, and number less than 100,000, the large cities, Paris, Lyons, and Bordeaux, being the chief centres. (See HUGUENOTS.)

CHARITIES. Thrift is a national characteristic of the French people, and pauperism has never been prominent in France. The policy adopted in dealing with the needy has been characterized by the emphasis which has been placed upon voluntary relief, and upon outdoor and local, as against institutional relief. The State does not recognize that the individual has a legal right to demand alms, and does not place the local communities under compulsion to provide means of charity relief. Direct parochial taxes for charitable purposes have not been levied since the time of the French Revolution. The scheme for charity administration as drawn up under Napoleon I. made possible the formation of a *bureau de bienfaisance* in each commune, but it was not made compulsory and has been impracticable in the smaller and poorer communes. There is therefore no communal machinery of relief for the poor in a large part of rural France. These bureaux (consisting of the mayor of the commune and six commissioners) solicit and receive contributions from private sources, and the bulk of their endowment is secured in this way. Special grants are sometimes made by the communes, and a tax is levied upon theatres, balls, concerts, and other amusements. The bureaux give outdoor relief, the amount of which is likely to be arbitrarily adjusted to the funds at command rather than the existing needs, and may be either meagre or excessive. Many of the communes are provided with hospitals, and sometimes a number of communes jointly use the same hospital. Coöperation between the State systems of charity and private charity is minimized, inasmuch as private charity is mainly religious, while the attitude of the State is essentially anti-religious.

There are, however, two classes of the needy that have been very adequately provided for, namely, the dangerously insane and children. The necessity for caring for the first of these is evident. Asylums for that class are established in the different departments (although there are also State asylums), and their support is divided between the departments and the

communes. The State places itself under special obligation for providing for children by virtue of its law which prevents the attempt to fix the responsibility for fatherhood. Three different classes of children are distinguished in the system of child-relief. The children of the first class are under two years old—*enfants du premier âge*—and are placed in the care of a nurse under the most careful surveillance of the Government authorities, the expenses incurred being divided equally between the State and the department. The second group, or *enfants assistés*, includes foundlings, abandoned children, destitute orphans, and *enfants secourus*, not exceeding twelve years of age at the time when the Government assumes control over them, although remaining under public control until they reach the age of twenty-one. These children are usually placed in peasant homes until they are thirteen or fourteen years old, when they are made apprentices—preferably in the same family—under guardianship, the guardians being subject in turn to the oversight of the State-paid department inspectors. The other expenses incurred in providing for this group are shared between the State, the department, and the commune. A large number of children requiring public attention but not coming under either of the above classes fall in a third group, *enfants moralement abandonnés*, who are generally apprenticed or placed in an industrial school.

A departmental system of medical aid was established in 1893, and, according to the statistical returns, by the end of the century about half of the population of France availed themselves of the medical aid thus supplied. The Government further aids the masses through the establishment of savings banks, and through the State monopoly of pawnshops, and particularly, since 1897, by an annual contribution to old-age pensions. The State exercises a direction and surveillance over the administration of the charities system, this function being in charge of a department under the Minister of the Interior. The influence of the central department operates largely through the prefects, who are responsible to the Minister, and who have a voice in the appointments of boards of managers of hospitals, asylums, and *bureaux de bienfaisance*.

GOVERNMENT. The present government of the French Republic is based on a series of three so-called 'constitutional' laws, adopted by the National Assembly in 1875, and since that date amended and supplemented at different times by ordinary statutes, called 'organic' laws. The French Constitution, therefore, differs from most written constitutions in not being comprised in a single document. Another peculiarity is its brevity and conciseness. Only the barest outlines of the government—the mere framework—are provided for in the fundamental law, all the details of organization being left to the determination of ordinary statute. The numerous limitations upon the power of the Government in behalf of individual liberty, which constitute so notable a feature of the Constitution of the United States, are wholly lacking in the French Constitution. It is, in short, a constitution of government and not of liberty. That part of the Constitution which is contained in the so-called organic laws is subject to amendment by the ordinary processes of legislation, while the pro-

visions of the constitutional laws may be changed only by action of the Chambers united in National Assembly, and by absolute majority of all the members.

The form of government which has prevailed in France since 1875 may be described briefly as a centralized parliamentary republic. The Constitution provides for a bicameral Parliament, consisting of a Chamber of Deputies and a Senate, with substantial equality of powers in legislation, the only exception being the exclusive power which belongs to the Chamber of Deputies to originate revenue measures. As to the composition of the Chamber and the source from which it proceeds, the constitutional laws contain no provisions except the single one that its members shall be chosen by universal suffrage. It was provided by ordinary statute that universal suffrage should be considered as the suffrage of all male citizens twenty-one years of age, who have resided for a period of six months previous to the election in the commune in which they offer to vote. Certain classes who have lost their civil and political rights, or who are in active military or naval service, or who have been judicially convicted of certain crimes, as well as those who have been declared bankrupt, are disqualified. It has also been determined by ordinary statute that the Chamber should consist of Deputies apportioned according to population, on the basis of one Deputy to every 70,000 inhabitants. At the present time there are 584 Deputies, distributed among 97 administrative departments, into which France and the colonies are divided. The departments are subdivided into *arrondissements*, containing approximately equal populations, and one Deputy is assigned to each. Where an *arrondissement* contains a population exceeding 100,000, it is divided into two or more constituencies. The Deputies are chosen, not according to general ticket (*scrutin de liste*), as Presidential electors are chosen in the United States, but by district (*scrutin d'arrondissement*), according to the American method of choosing Representatives. Both methods have been tried, chiefly with a view to obtaining party advantage; but since 1889 the single-district method has been in use, and seems likely to continue as a permanent institution. The constitutional laws make no provision concerning the qualifications of Deputies. The completion of the twenty-fifth year, however, has been prescribed by statute as a necessary qualification. To this is added a number of disqualifications, such as the holding of certain other incompatible offices at the same time. The term of service is fixed at four years, unless the Chamber is dissolved earlier, and the members are privileged from arrest during the session, unless taken in the act of committing a crime. They are, moreover, exempt from legal responsibility for opinions expressed during the discharge of their legislative duties.

The constitutional laws now in force make no provision concerning the composition and organization of the Senate, and but scant provision in reference to its powers. A statute of 1884, which superseded the constitutional law on the subject, provides that it shall consist of 300 members, chosen by electoral colleges in the various departments. In each department this body consists: (1) Of the Deputies chosen in the par-

ticular department; (2) the members of the General Council of the department; (3) the members of the councils of the several *arrondissements* in the department; and (4) delegates chosen by the municipal councils of all the communes of the department. The Senators are apportioned among the several departments according to population, the number in each varying from one to ten. In contrast to the method of choosing Deputies, the Senators from a given department are selected on a general ticket (*scrutin de liste*), each elector voting for the whole list. By statute the qualifications of Senators are fixed at citizenship and the completion of the fortieth year. There are also certain disqualifications similar to those in the case of Deputies. The tenure of Senators is fixed at nine years, and, to secure partial renewal, it is provided that the terms of one-third of them shall expire every three years. Originally there were 75 life Senators, chosen by the National Assembly, their successors being selected by the Senate. By an amendment to the Constitution, adopted in 1884, however, this remnant of monarchy was abolished, and it was provided that thereafter vacancies occurring among life Senators should be filled according to the manner prescribed for the choice of nine-year Senators. Senators have the same rights and privileges as Deputies, and receive the same salary, which at present is 9000 francs a year. In addition to its legislative duties, the Senate has two peculiar functions: First, its consent is necessary for a dissolution of the Chamber of Deputies—a restraint upon the possible arbitrary conduct of the President; and, second, it acts as a high court for the trial of persons accused of attempts upon the safety of the State.

The Constitution requires the two Chambers to assemble annually in January, and to remain in session at least five months. The President may convene them at an earlier date, and he is bound to do so if the demand is made by a majority of the members composing each Chamber. They may also be adjourned by the President; but the duration of the adjournment cannot exceed one month, and is not permitted to occur more than twice in a session. Bills may be presented in either Chamber by private members or Ministers, except that revenue measures must originate in the Chamber of Deputies. Whether the Senate has the right to amend bills of this character is a disputed question. The Chamber of Deputies denies the right of the Senate to increase its revenue proposals, but the Senate has asserted its right successfully on a number of occasions. All bills must be referred to a special committee for consideration before being taken up in either House. A measure duly passed by both Chambers is sent to the President for his approval. He has neither an absolute nor a qualified veto, although he may demand reconsideration of the measure, and a constitutional obligation rests upon the Chambers to consider his objections; but if they repass the measure by the regular majority it becomes law in spite of the President's objections.

Although the parliamentary system of government prevails in France and monarchical traditions are strong, the chief executive is elected, not, however, by popular vote, but by a body composed of the members of the two Chambers

of the Legislature. They are required to meet for this purpose at Versailles at least one month before the legal expiration of the Presidential term, and in case of the death or resignation of the President they are commanded to assemble immediately and form themselves into an electoral college. A majority of the whole number of members is necessary to elect. The only qualification prescribed by the Constitution is that the President shall not be a member of any family that has reigned in France. His term is fixed at seven years, and it is expressly declared that he is reëligible. The President's position is one of irresponsibility except for the offense of high treason, and even then he is subject to arraignment by the Chamber of Deputies only, and to trial by the Senate only.

The powers and duties of the President are manifold. In the domain of foreign relations his powers include the negotiation of treaties, with the limitation, however, that treaties of peace and of commerce, treaties which add to the financial burdens of the State or which subtract from its territory, or which affect the personal or property relations of Frenchmen in foreign countries, must be approved by the Chambers; the appointment and reception of ambassadors and ministers; and perhaps the power to wage defensive war and, with the assent of the Chambers, to wage offensive war. Besides the powers of the President in legislation, to which reference has already been made, he may prorogue the Parliament, may initiate legislative measures, and it is his duty to promulgate the laws. In the field of administration he has a wide power of appointment and of supervision, and an extensive ordinance power. The Constitution expressly confers upon him the appointment of all officers, and by implication the dismissal of most of them. He has the power of issuing the necessary ordinances for the execution of the laws where the Legislature has not made provision for the same. He has also the power in many cases to issue supplementary ordinances for the purpose of filling out the details of legislative acts, for it must be remembered that it is the practice in France to embody only the main facts in the statutes, leaving minor details to be supplied by executive ordinance. The military powers of the President include the disposition of the army and navy, while in the domain of judicial administration he is vested with the power to grant pardons, commute penalties, and issue reprieves.

In exercising the above-mentioned powers the President acts through Ministers who are collectively responsible to the Chambers for the general policy of the administration, and individually responsible for their own personal acts. The Constitution expressly declares that every official act of the President to be valid must be countersigned by a Minister, thus insuring the irresponsibility of the President. Theoretically, at least, he is in the position of the British sovereign, and can do no wrong. In theory the Ministers are appointed by the President and serve during his pleasure. In practice they are appointed by the leader of the majority in the Chamber of Deputies, and they resign when defeated. Legally their responsibility is to both Chambers, but as a matter of fact it is only to the Chamber of Deputies, and an adverse vote in

the Senate no longer leads to the resignation of the Ministry. Usually the Ministers are selected from the members of Parliament, but whether they are or not, they are entitled to seats in the Chambers, and must be heard whenever they wish to speak. Their duties are of a twofold character. In the first place, they are the heads of the several administrative departments of the Government, and secondly they are the leaders of the parliamentary majority in the Legislature and the representatives of the Government whose measures they seek to have adopted, and whose general policy they defend against attack. The number of Ministries or departments is fixed by decree of the President, and varies from time to time. At present there are eleven: those of the Interior; of Justice; of Foreign Affairs; of War; of Marine; of Public Instruction; of Public Works; of the Colonies; of Commerce; of Agriculture; and of Finance. Besides acting as heads of the departments they are also members of the Council of State, the highest administrative court in the Republic. Their responsibility is both political and criminal. Their political responsibility is collective in matters of general policy, and single in cases of individual activity, and is secured by liability to dismissal from office. Their responsibility for crimes committed in the exercise of their duties is to the Legislature, the Chamber of Deputies acting as the accuser and the Senate as the trial court. For crimes committed in their private capacity they are responsible to the ordinary judicial courts. The Ministers are held to their political responsibility through several forms of interrogation in the Chambers. These are the 'direct question,' which any member may ask of a Minister after previously securing his consent, the purpose being to gain information concerning the policy of the Government; and the 'interpellation,' which is a formal challenge of the Government's policy, and is usually followed by a vote of confidence or of disapproval. Unlike the direct question, the interpellation is always in order, and the consent of the Minister questioned or of the Cabinet is not necessary.

Finally, it should be said that French Ministries are short-lived, chiefly on account of the numerous party divisions and factional groups in France. As yet no Ministry of the Republic has continued in power for a period exceeding three years.

The judicial system of France is a purely statutory creation, the only constitutional provision on the subject being that which relates to the constitution of the Senate as an extraordinary court for certain cases. By statute a hierarchical system of judicial and administrative courts has been created. Of the judicial courts, the highest is the Court of Cassation at Paris, which is composed of a First President, three presidents of sections, and forty-five judges or councilors. Next below this tribunal are the twenty-six Courts of Appeal, each composed of a president and four councilors, and with territorial jurisdiction over several departments. They hear cases from the Courts of First Instance in the arrondissements, while these in turn hear appeals from decisions of the justices of the peace in the cantons. These latter try civil cases and act as police judges for the disposal of petty offenses. For the trial of criminal cases involv-

ing penalties up to imprisonment for five years, police correctional courts without juries are provided. More serious crimes are tried by courts of assizes, constituted periodically in each department, and consisting of a jury of twelve men who are the sole judges of the question of guilt, and who fix the punishment. The ordinary civil courts are without juries, the judges alone deciding the question of fact, as well as of law. The judges are appointed by the President of the Republic, and their tenure, except in the case of the justices of the peace, is good behavior. They can be removed only by the Court of Cassation.

The administrative courts are an outgrowth of the Napoleonic legislation, and are intended to relieve the judicial courts from the decision of administrative questions. It is the French theory that such questions should be determined by men who have a practical knowledge of administrative law, rather than by judges who have been trained only in the private law. The administrative courts are tribunals of enumerated jurisdiction, but the general rule is that they take cognizance of all administrative acts. The judges of the administrative courts are all appointed by the President, but, unlike the members of the judicial courts, are removable at his pleasure. They are trained in the work of administration and receive large salaries. The most important administrative court in France, as well as the highest, is the Council of State. It is composed of 116 members (councillors, commissioners, and auditors), and is divided into four administrative sections and one judicial section. It has both original and appellate jurisdiction in a variety of administrative matters. Next to the Council of State in importance are the prefectural councils of the departments. There is one in each department, and it is composed of several councillors, together with the prefect. It has a large contentious jurisdiction in administrative matters, and appeals from its decisions lie to the Council of State. Besides these courts there are a number of special administrative tribunals of minor importance. To determine whether the administrative or the judicial courts shall have jurisdiction in a given case, where the question of the forum is in dispute, a Tribunal of Conflicts is provided. It belongs to the prefect to raise the question of competence, whereupon the matter is sent to the Conflict Court for determination.

Local government in France differs from the English and American systems in several important respects. In the first place, the organs of local government in France are not generally authorities of enumerated powers, but are vested with the management and control of all local affairs without any attempt at specification. Secondly, to prevent the local organs from misusing such wide powers, the method of central administrative control has been introduced. This is the most important characteristic of French local government, and, like the system of administrative courts, was inherited from the Napoleonic era. While it secures uniformity and symmetry, it destroys the element of local self-government. The activities of the local organs are twofold. In the first place, they are made use of by the central Government for the administration of matters of central concern. In the

second place, they attend to matters of purely local interest largely according to their own ideas and through officers of their own choosing. For the purposes of administration France is divided into eighty-seven departments, in each of which is a prefect, appointed and removed at the pleasure of the President. He is both a central and a local officer. As agent of the central Government he supervises the execution of the national laws, and decrees and instructions of the Ministers, particularly those of the Minister of the Interior, of whom he is a subordinate; issues police ordinances, appoints many officials and directs them in their duties, and makes reports to the Government on matters in which it is concerned. In this capacity he is assisted by a prefectural council, appointed and dismissed by the President—a body whose advice he is often bound to ask, but never obliged to follow. As a local officer he appoints all the officials in the service of the department, has charge of departmental finances and public improvements, and executes the resolutions of the General Council. This latter body is the legislative assembly of the department, and is chosen by universal suffrage for a term of six years, one-half the members retiring every third year. It holds regular sessions twice a year, and the subjects to which its legislative power extends include departmental property, finances, highways, public works, and poor relief. Its resolutions in many cases may be annulled by the central Government, and in some cases they must be approved by the President of the Republic to be valid. If, for example, in the preparation of the budget, the council should neglect or refuse to make the necessary appropriations, or levy the taxes required, the President is empowered to order it done.

The next local subdivision below the department is the *arrondissement*. This is an administrative and election district rather than a public corporation for purposes of local government. Below the *arrondissement* is the *canton*—an election and judicial district of little importance. The lowest administrative unit is the *commune*—a local area of historical growth rather than an artificial creation. It may be either urban or rural, and varies in size from a few acres to several square miles. The two communal organs which correspond to the prefect and the general council of the department are the mayor and the municipal council. The mayor, like the prefect, is both a central and a local officer, and since 1884 has been elected by the municipal council. As a central officer, he is subject to the control and direction of the prefect. He serves during the term of the council by which he is elected, but may be suspended temporarily by the prefect or Minister of the Interior, and removed by the President. As central officer he keeps a register of vital statistics, solemnizes marriages, has charge of the police, and issues ordinances affecting the public health, order, and safety. As local officer he appoints most of the communal officers, administers the local property, draws up the budget, and supervises the execution of the resolutions of the municipal council. The municipal council is the deliberative organ of the commune, and is elected by universal suffrage for a term of four years. It holds four regular sessions annually, may be suspended temporarily by the prefect, and dissolved by the

President of the Republic. Its duties extend chiefly to purely local affairs, but the approval of the central Administration is necessary for the validity of its resolutions on many subjects, such as those relating to the erection of public works, incurring loans, levying taxes, and appropriating money. Any act deemed by the central Administration to be in excess of its jurisdiction may be declared void. Excepted from this general system of municipal government are the capital, Paris, and the city of Lyons, for the government of which a special arrangement is provided.

NATIONAL DEFENSE. In view of the great emphasis placed upon keeping the national system of defense in the highest possible degree of efficiency, and the important rôle which the army plays in the national life, France has become known as a military republic. All able-bodied men are liable to military service for a term of 25 years. Three years' active service, beginning at the age of 20 years (although the individual may volunteer his services during the two preceding years), are required; but provisions are made, applying mainly to advanced students, by which under qualified conditions the period may be shortened to one year. Appointments to military offices are made by the President of the Republic, but the command of the army is vested in the department of the Ministry of War. In 1902 the total strength of the army, including the forces in Algeria and Tunis, was 589,444. There are 4,350,000 men who are liable to military duty, of whom 2,500,000 are available. A statement of other general regulations, and the treatment of the scheme and the statistics of army organization will be found under the title **ARMIES**. Staff officers are trained at a military school in Paris, the course being two years, and admission is secured by competitive examinations; infantry and cavalry officers are trained at Saint-Cyr; artillery and engineer officers at the polytechnic school situated at Fontainebleau; and in addition to these there are a large number of schools for various phases of military instruction.

The fortifications of France, being situated naturally with reference to the nature of the frontier and the relative danger of invasion, are most numerous in the north. Lille and Maubeuge are on the Belgian frontier; Toul, Verdun, Epinal, and Belfort are near the German frontier. Other fortified places in the north are Laon, La Fère, Paris, and Langres. The fortifications at Besançon, Pontarlier, Dijon, Albertville, Briançon, Nice, Grenoble, and Lyons defend the country on the east. Near the Spanish frontier are the small fortifications of Perpignan and Mont Louis, on the east, and Bayonne, on the west. The Atlantic Coast fortifications are Dunkirk, Calais, Boulogne, Havre, Cherbourg, Granville, Saint-Malo, Brest, Lorient, Saint-Martin de Ré, Ile d'Aix, Oléron, La Rochelle, Rochefort, and the Estuary of the Gironde; while the Mediterranean coast is protected at Villefranche, Antibes, Saint-Tropez, Marseilles, Toulon, Cette, and Port-Vendres.

Great attention is also given to the naval branch of the national defense, and the navy of France is generally considered to rank next to that of Great Britain. The personnel of the navy is recruited partly by voluntary enlistment, and partly by conscription. The Government maintains a list of all of the men between the ages of eighteen and fifty years who are engaged in a

seafaring life, and these men constitute a naval reserve. Particulars of the organization and strength of the navy are given in the article **NAVIES**. The colonial points used by France as a basis of supplies and operation are: Cape Saint Jacques in Cochinchina, Port Courbet in Tongking, Fort de France in Martinique, Saintes in Guadeloupe, Port Phaéton in Tahiti, Nouméa in New Caledonia, Dakar in Senegal, Libreville in Congo, and Obock on the East African coast, at the entrance to the Red Sea. The principal naval school for the training of naval officers is situated at Brest.

HISTORY.

Gallia, or Gaul, was the ancient name under which France was designated by the Romans. They knew little of the country till the time of Cæsar, who, after a series of wars covering seven years, completed its conquest in B.C. 51. At this time it was occupied by three branches of the Celtic race—the Aquitani, the Celtæ, and the Belgæ. There were also some Germanic inhabitants and a few Ligurians and Greeks, but the latter never penetrated far beyond the shores of the Mediterranean, where they planted colonies, the most important of which was Massilia (Marseilles). Under the Roman rule Gaul advanced rapidly in civilization and refinement, and was one of the most important portions of the Empire. (See **GAUL**.) With the decline of the Roman power in the fifth century it fell completely under the power of the Visigoths, Burgundians, and Franks. In A.D. 486 Clovis, a chief of the Salian Franks, by his victory over Syagrius near Soissons, put an end to the Roman dominion. Clovis embraced Christianity in 496. After his death in 511, his kingdom was divided among his sons, Theodoric, Chlodomer, Childebert, and Clothaire. His dynasty, known as the Merovingian, ended in the person of Childeric III., who was deposed, in 751, after the reality of kingly power had already passed into the hands of the mayor of the palace, Pepin of Heristal, and after him into those of Charles Martel and Pepin the Short, the latter of whom ascended the throne as the first of the Carolingian rulers. (See **FRANKS**; **MEROVINGIANS**; **CAROLINGIANS**.) The accession of Pepin gave new vigor to the Frankish monarchy, which, under his son and successor, Charles the Great, crowned Emperor of the West by Pope Leo III. in 800, became a powerful empire. Christianity, civilization, and letters were protected during the reign of Charles the Great, and before his death he had extended the limits of his empire from the Baltic to the Mediterranean, and from the Bay of Biscay to the coast of Illyria. After his reign, however, this vast power crumbled to pieces. By the Treaty of Verdun, in 843, following the death of Louis the Pious, the son of Charles the Great, the Frankish Empire was divided among his sons. The lands east of the Rhine, whose inhabitants were predominantly Teutonic in race and language, were assigned to Louis the German; the part corresponding closely to modern France and the southern part of Belgium (the kingdom of the Western Franks) fell to the possession of Charles the Bald; between the two lay the territories of Lothair, who, in addition, received Italy and the Imperial title. The descendants of Charles the Bald (died 877) possessed little or none of the vigor of the early Carolingians.

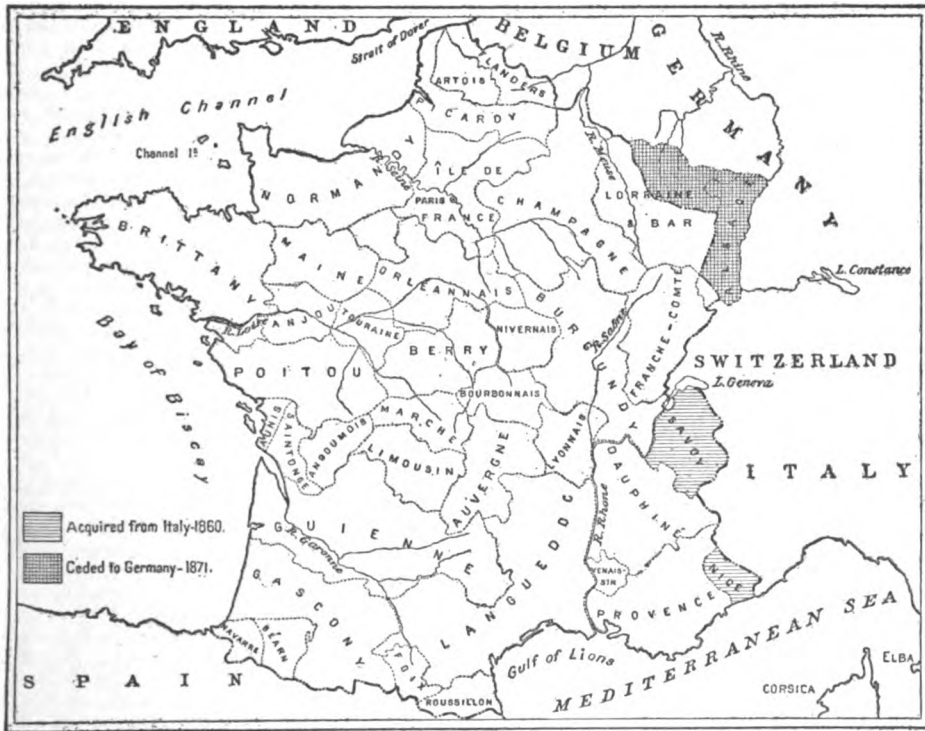

Louis the Stammerer (872-879) was the helpless creature of powerful nobles. Louis III. and Karlmann, sons of Louis the Stammerer, were forced to witness the loss of the Rhône Valley and the hostile incursions of the Northmen. In 884 Charles the Fat, King of Germany and of Italy, was made King of the western Franks, thus reuniting the realm of Charles the Great. After a stormy reign of three years, in the course of which Paris all but fell into the hands of the Northmen, he was deposed, and Odo, Count of Paris, was raised to the throne of France. Intestine wars desolated the land, and foreign assailants threatened it on every side. Under Charles the Simple (893-929), the ravages of the Northmen had assumed so persistent a character that the King was glad to purchase immunity from their encroachments by the cession of the territory subsequently known as Normandy (c.911). In the kingdom anarchy reigned paramount, the various governors established an hereditary authority in their several governments, and the Crown was by degrees deprived of the best part of its possessions. The power of some of the vassals surpassed that of the kings; and on the death of Louis V. the Carolingian dynasty was replaced by that of Hugh, Count of Paris, whose son, Hugh Capet, was elected King by the army and consecrated at Rheims in 987. See CAPETIAN DYNASTY.

At this period the greater part of France was held by almost independent lords, and the authority of the Capetian kings for more than a century extended little beyond Paris and Orleans. Among the most important of the great feudal vassals whose possessions made up the lands of the French Crown were the counts of Flanders, Vermandois, and Champagne, the dukes of Normandy, Burgundy, and Aquitaine, and the counts of Anjou and Toulouse. Louis the Fat (1108-37) was the first of the Capetians who ruled with a strong hand. He exalted the power of the Crown at the expense of the feudal nobles, and increased the royal territory. Louis VII. (1137-80), who took part in the Second Crusade, was almost incessantly engaged in war with Henry II. of England, whose marriage with Eleanor of Aquitaine made him master of that region and Poitou, in addition to his hereditary possessions of Normandy and Anjou. Louis's son and successor, Philip Augustus (1180-1223), wrested Normandy, Maine, Anjou, Touraine, and Poitou from John of England, and increased the power of the Crown in other parts of France. He took a personal share in the Third Crusade, and permitted the Pope to organize crusades against the Albigenses in the southern parts of the country. The power of the barons in the south was greatly weakened, and ultimately their territory was merged with the royal domains. By improvements in the administration of justice, the right of appeal to the royal courts was established, and the arbitrary power of the great vassals crippled. It was the policy of Philip Augustus to make use of the clergy and the jurists against the nobles, and it was the jurists especially who aided in the establishment of an absolute monarchy by their introduction of the principles of the old Roman law. Under Philip Augustus, France attained the leading place in Europe. The King knew how to win the friendship of the Pope without yielding to the Papal preten-

sions. He was powerful enough to defeat Otho IV. of Germany and his allies at Bouvines in 1214—a victory which secured his hold on the territories taken from King John. Improvements in the mode of administering the law were continued under his son, Louis VIII. (1223-26), and his grandson, Louis IX. (1226-70), who is one of the saints of the Catholic Church. Louis IX. engaged in the crusades, and died in an expedition against Tunis. He effected many modifications in the fiscal department, and left the kingdom stronger than ever before. His son, Philip the Bold (1270-85), annexed the county of Toulouse to the royal domains. Philip IV. (1285-1314), surnamed Le Bel, or the Fair, acquired Navarre, Champagne, and Brie by marriage. With a view to securing support against the secular and ecclesiastical nobility, with whom he was constantly at war, Philip gave prominence to the burgher element in the nation, and in 1302 he, for the first time, called together the *états généraux*, or general estates, at which the *tiers état*, or burgher class, appeared, together with the nobles and clergy. These changes were, however, accompanied by innovations in the fiscal and other departments of the Government, which were effected with haste and violence. His tyrannical persecution of the Templars showed the extent to which the regal power could be stretched. At the same time the removal of the seat of the Papacy to Avignon insured to France a predominant influence in European affairs. Under his successors, Louis X. (1314-16), Philip V. (1316-22), and Charles IV. (1322-28), the last direct descendant of the Capetian line, the rule of the kings of France became even more unlimited. Philip VI. (1328-50), the first of the House of Valois, a cousin of Charles IV. and the nephew of Philip IV., ascended the throne in accordance with the Salic law (q.v.). His reign and those of his successors, John the Good (1350-64), and Charles V., the Wise (1364-80), were disturbed by constant wars with Edward III. of England, who laid claim to the throne in right of his mother, a daughter of Philip the Fair. The Hundred Years' War (q.v.) began in 1339. In 1346 the English won a great victory at Crécy. In the battle of Poitiers (1356) John was made captive, and as the war dragged on, the State was reduced to bankruptcy, the nobility excited to rebellion, and the mass of the people greatly impoverished. Debasement of the coinage, onerous taxation, and arbitrary conscriptions brought the country to the verge of ruin, while the victories of England humbled the sovereign, decimated the French armies, and cut down the flower of the nation. The insurrection of the peasantry, known as the Jacquerie, occurred in 1358. The long and weak minority of Edward III.'s grandson, Richard II., diverted the English from the prosecution of their claims to the kingdom of France, which revived somewhat from the effects of its long and disastrous warfare; but during the minority of Charles VI. (1380-1422) the war was renewed with increased vigor on the part of the English nation, who were stimulated by the daring valor of Henry V. The signal victory won by the English at Agincourt in 1415: the treason and rebellion of the French princes of the blood, who governed the larger provinces; the ambition of the several regents, the ultimate imbecility of the King, the profligacy

of his queen, and the love of pleasure early evinced by the Dauphin, all combined to aid Henry in his attempts upon the throne. But the premature death of Henry, the persevering spirit of the people, and the extraordinary influence exercised over her countrymen by the Maid of Orleans (see JOAN OF ARC), concurred in bringing about a reaction, and after a period of anarchy Charles VII., the Victorious (1422-61), was crowned at Rheims. A fierce struggle, however, had still to be waged for the recovery of the French provinces from the hands of the English, who were not driven out from Normandy and Guienne until the middle of the century, when

fense of the interests of the States General, but in reality out of fear of the growing power of the monarchy. Forced to yield in the beginning, the King soon turned their own weapon against them. The States General at Tours, in 1468, summoned to consider the question of reforms in the administration and the finances, revoked nearly all of the concessions which the princes had succeeded in extorting from Louis in the Treaty of Conflans, three years before. In Charles the Bold of Burgundy, Louis encountered a formidable rival, who bade fair to erect between France and Germany a kingdom more powerful than either; but Charles fell in battle against the

MAP OF FRANCE SHOWING FORMER PROVINCES.

nothing but Calais remained in their possession. Charles obtained from the States General a regular tax (*taille*) for the maintenance of paid soldiers to keep in check the mercenaries and marauders who pillaged the country. He laid the real foundation for the absolute power of the King by obtaining the support of the third estate.

It remained for his successor, however, completely to break the power of the great vassals of the Crown, and to lay upon the ruins of feudal anarchy the secure foundations of absolutism. Louis XI. (1461-83) brought to the task the manifold resources of a wily, unscrupulous nature, true to the moral type of the Renaissance and to those ideals of statecraft which Machiavelli was soon to formulate in his *Principe*. The essential meanness of his character and of his entire career was atoned for only by the inestimable benefits which he conferred upon his country. Soon after his accession to the throne, the princes of the royal blood formed the League of the Public Weal against Louis, ostensibly in de-

Swiss in 1477, and of his possessions the Duchy of Burgundy passed to France. Louis XI. did not live to consolidate all of France under the Crown; but before his death the royal power had been extended over Berry, Burgundy, Provence, Anjou, Maine, and other regions.

Charles VIII. (1483-98), by his marriage with Anne of Brittany, secured that powerful principality, and consolidated the increasing power of the Crown. His invasion of Italy, in 1494, decided for all the future the relations of France to the other powers of Europe, and may be regarded as marking the beginning of the modern era of international policy. With Charles VIII. ended the direct male succession of the House of Valois. (See VALOIS, HOUSE OF.) Louis XII. (1498-1515), known as 'Le père du peuple,' was the only ruler of the Valois-Orleans family. The tendency of his reign was to consolidate the royal power, while the general condition of the people was ameliorated. Louis XII. engaged in bloody wars in Italy for the possession of Lombardy and

the Kingdom of Naples, but failed to achieve any permanent conquests. His successor, Francis I. (1515-47), of the Valois-Angoulême branch, still intent upon establishing French dominion in northern Italy, waged endless wars with the Hapsburgs, which wasted the resources of his kingdom. A concordat with the Pope, signed in 1516, secured to the King the right of nominating the Gallican bishops. In the reign of Francis the Assembly of Notables and Deputies superseded the States General. Nevertheless, the arts and literature were encouraged in this reign, as well as in that of the succeeding monarch, Henry II. (1547-59), who continued the struggle with the Hapsburgs. The Emperor Charles V., who had warred successfully against Francis I., being crippled by the events which grew out of his war with German Protestants, Henry seized the opportunity to wrest the bishoprics of Toul, Metz, and Verdun from the German Empire and annex them to France. In this reign began the persecutions of the Huguenots (q.v.).

With the death of Henry II. began a period of strife between factions which lasted for more than thirty years, and brought upon France the full horrors of civil war. The three sons of Henry II., Francis II. (1559-60), Charles IX. (1560-74), and Henry III. (1574-89), were weak-willed and incapable, and the history of their reigns is the story of a ceaseless struggle for mastery on the part of the powerful House of Guise, carried on under the pretense of a war for religion. Opposed to them were the Huguenots, led at first by the Prince of Condé and the great Coligny, and later by Henry of Navarre. Between the two, and playing off one against the other, was the gifted and unscrupulous Queen-mother, Catharine de' Medici. Nine civil wars were fought in the space of a generation (beginning with 1562), wars in which the Huguenots did not hesitate to call in foreign aid against their enemies, nor both parties to employ perjury and assassination. The massacre of Saint Bartholomew's (see BARTHOLOMEW'S, MASSACRE OF SAINT) perpetrated by Catharine de' Medici with the aid of the Guises, crushed the Huguenots into non-resistance for some five years, but served only to increase the power of the Guise family, who, as heads of the Catholic League, sought to exclude Henry of Navarre, the rightful heir to the throne, from the succession. Henry III., who thought his own life and crown in danger, caused the Duke of Guise and his brother, the Cardinal of Lorraine, to be assassinated (1588); but perished himself by the assassin's knife in the following year, and the crown passed from the House of Valois.

The accession of Henry IV. of Navarre (1589-1610), a Bourbon prince, descended from a younger son of Saint Louis, allayed the fury of the religious wars, but his conversion to Catholicism estranged his own party, for whom, however, religious toleration was secured by the Edict of Nantes (1598). The early part of his reign was disturbed by mutinies of the troops and the rebellions of the nobles. By degrees, however, Henry, through the astute policy of his Minister, Sully, and by his own personal popularity, raised the power of the Crown higher than ever, while he began a system of thorough administrative reform, which was arrested only by his death at the hands of the fanatic Ravaillac

in 1610. The first permanent French settlements in Canada were established under Henry IV.

During the first years of the reign of Louis XIII. (1610-43), the Government was in the hands of the Queen-mother, Maria de' Medici. The year 1614 is noteworthy as the date of the last meeting of the States General before 1789. After 1624 the real ruler of France was Cardinal Richelieu. His accession to power speedily put an end to the political intrigues which had disturbed the country during the regency of Maria de' Medici and the personal rule of Louis. Richelieu relentlessly repressed the risings of the Huguenots, who, under their ambitious leaders of the House of Condé, had become a menace to the State. La Rochelle, the last of their places of refuge, was taken in 1628, and Protestantism as a political force ceased to exist in France. The Huguenots, however, were not molested in the free practice of their religion, as guaranteed by the Edict of Nantes. Abroad, Richelieu carried on with marked success the contest against the House of Austria, which Henry IV. was about to resume at the time of his death. The Thirty Years' War in Germany afforded him the opportunity. Gustavus Adolphus was maintained largely by French subsidies, and after 1635 it was French aid that made possible the victorious campaigns of Bernhard of Weimar, Torstenson, and Baner. Alsace was acquired in 1639, and (though Richelieu did not live to see this) by the Peace of Westphalia (1648) France was confirmed in the possession of the bishoprics of Metz, Toul, and Verdun, and secured the right to intervene in the affairs of Germany as one of the guarantors of peace.

During the minority of Louis XIV. (1643-1715), Cardinal Mazarin exerted the chief authority under the regent, the Queen-mother, Anne of Austria. The refractory attitude of the Parlement of Paris and the repression of the nobility gave rise to another civil war (see FRONDE), but with the assumption of power by young Louis (1661), a new era commenced. Supported by the financial ability of Colbert, the military genius of Turenne, the engineering skill of Vauban, and the organizing talent of Louvois, Louis made France the great power of Europe. Franche-Comté and a part of Flanders were added to France by the Treaty of Nimeguen (1678). The ambitious schemes of Louis forced the powers of Europe in self-preservation to unite against him. Within, Louis reigned as absolute monarch, concentrating all the power of Government in himself. The progress of the people in the arts of peace was accomplished with rapid strides. Under the inspiration of the *Grand Monarque* French society attained a degree of culture and refinement that had not been known even in the days of the Italian Renaissance. This, too, was the Golden Age of French literature. The French language and customs exercised an immense influence on the manners of the higher classes throughout Europe, being not the least potent in distant and barbaric Russia. The Court of Louis XIV. became the model for European princes. There was, however, a dark side to the picture. The oppressive war taxes, the prodigality of the Court, the luxurious lives of the clergy, and the absolutism and bigotry of the aged monarch, combined to undermine the foundations of na-

tional prosperity and freedom. The latter part of Louis XIV.'s life was marked by a long series of misfortunes. The French armies were repeatedly defeated, the prestige of France was destroyed, and only the jealousy of its enemies saved it from utter humiliation. The War of the League of Augsburg (1689-97) was marked by the defeat of the French in the naval battle of La Hogue (1692), which wrested from them the mastery of the seas. With the outbreak of the War of the Spanish Succession (see SUCCESSION WARS) came the downfall. Louis XV. (1715-74) succeeded to a heritage whose glory was tarnished, and to a throne whose stability was shaken to its very foundations. The reign of Louis XV. presents nothing worthy of notice except the acceleration in the process of dissolution of the monarchy and the development of revolutionary influences. The regency of the profligate Duke of Orléans brought the nation to the verge of bankruptcy. The struggle with England in the Seven Years' War (q.v.) stripped France of Canada and Louisiana, while the capricious change of policy which the King's mistress, Mme. de Pompadour, forced upon the Government, brought contempt upon the country. During this reign the Order of the Jesuits, over which there was much controversy, was banished from France, 1764. In 1774 Louis XVI., a well-meaning but weak prince, succeeded to the throne and to the consequences of all the errors of his predecessors. His first ministers, Maurepas, Turgot, and Mallesherbes, failed in their attempts to carry out the necessary reforms, and were compelled to yield to the intrigues of the nobility, and resign their places. They were succeeded by the financier Necker, who endeavored, by economy and method, to arrest the impending bankruptcy of the State, and succeeding ministers (Calonne, Loménie de Brienne) made futile attempts to diminish these financial disorders by new forms of taxation, which were generally opposed by the Court. The nobles, the clergy, and the third estate were alike clamorous for a meeting of the States General, the privileged estates wishing to impose new taxes on the nation, and the third estate determined to inaugurate a thorough and systematic reform. After much opposition on the part of the King and Court, the States General, which had not met since 1614, assembled at Versailles on May 5, 1789.

France was ripe for revolution. Thoroughgoing reforms at the beginning of Louis XVI.'s reign might have averted the catastrophe, but a vacillating King, and ministers strong enough to aspire after the good without the power to achieve it, had served only to intensify the feeling of universal discontent, and to bring out in greater contrast than ever the irreconcilable antagonism between the new spirit of the age and the antiquated forms of government and society in France. In other countries of Europe, perhaps, the condition of the lower classes was as unhappy, the incapacity of Government as apparent, the survival of feudal customs as oppressive as in France; but in France alone had the newer intellectual life developed such activity as to render it incompatible with the continued existence of ancient institutions. Absolutism in France had been developed at the expense of feudal rights and popular liberties, and had

drawn to itself almost all the functions of national life; but absolutism since the time of Louis XIV. had failed in its duty to the nation, and appears in the *ancien régime* as a ponderous, rusty machine, making itself felt chiefly by its weight.

Under the old régime the internal administration of the country rested in the hands of the King's Council and of the Comptroller-General. Finance, justice, and legislation were all under the control of this powerful Minister, who acted in conjunction with various subsidiary councils. The country was divided into 32 provinces or generalities, each under an intendant, who was the agent of, and responsible to, the Comptroller-General. Except in the *pays d'état*, where the local magistrates retained some measure of self-government, the intendant united in himself the various functions of administration: police, public works, the care of the poor, and, chief of all, taxation. Through his subdelegates he collected every year the amount of the *taille* and other direct taxes assessed upon the province by the King's Council. The process of administration was cumbersome. Minute matters of local importance had to be passed upon by the Comptroller-General in Paris, and as a result, the provincial administration, though meaning probably to be neither harsh nor unjust, succeeded for the most part in being both.

Socially, the people of France were divided into two great classes—those who paid the *taille*, and those who did not. Among the latter were the nobility, numbering some 140,000 souls, and owning about one-fifth of the soil. They held exclusive possession of the high offices at Court; they were exempt from the *corvée* or forced work on the roads, and from service in the militia. Originally exempted from payment of the *taille*, because it was regarded as a commutation paid by the lower classes in lieu of military service, the nobles retained their exemption long after they had ceased to render military service. In the payment of indirect taxes, they also succeeded in evading a large part of their share. For the nobles there were the old privileges and immunities, the ancient rights of fines and dues and tithes, of hunting and fishing and warren, of toll on mill and wine-press; but the ancient service of protection and of guidance to the vassal were gone. A distinction, however, should be made between the Court nobility, who lived in magnificence at Paris or Versailles, and aided in heaping up the enormous deficit, with which the extravagance of the Court was weighing down the country, and the country nobles, who constituted the great body of the class, and lived in retirement on their estates, poor, inactive, since absolutism would make no use of them as its agents, and a burden, though very often an unwilling burden, to their tenants. The Church comprised some 60,000 monks and nuns, and 70,000 of the secular clergy. Between the prelates of the Church and the great body of the poor priests was the same gulf that separated the Court nobility from the resident nobles. The mass of the French priesthood was unselfish, devoted, zealous in its duties; but among the higher clergy, the archbishops and bishops, there were many who were no less selfish and ambitious than the nobility. Like the nobility, they were eager to escape their fair share of taxation,

and hungered after dues and tithes. The Church owned about one-fifth of the land in France, and, with the nobility and the Crown, shifted its burdens upon the remaining two-fifths. Privilege ruled also in the middle classes. In the towns the line of cleavage between the bourgeoisie and the artisan population was definite. Trade and industry were regulated by the guilds after the selfish spirit of mediæval times. Municipal offices were put up by the Government for sale, and as they generally carried with them certain privileges and immunities, chief among them relief from taxation, were greatly sought after. Powerful corporations were as assiduous in swearing off taxes as their modern successors. The rich bourgeoisie, in short, vied with the nobility and the Church in evading the burdens of State.

It was upon the peasantry, then, that the full brunt of taxation fell. Serfdom was almost extinct in France, more than one-fifth of the land was held by peasant proprietors, and, strangely enough, throughout the eighteenth century more and more land passed into the hands of the peasants in spite of the almost intolerable exactions imposed upon them. Yet Taine has calculated that four-fifths of the fruits of the peasants' labors were taken away by the Government in the form of *taille*, *corvée*, poll-tax, *vingtièmes*, and the *gabelle* or salt tax. The lands of the Church and of the nobles were cultivated by the peasants under the *métayer* system, where the owner supplied the stock and implements, and the peasant the labor, both sharing equally. The general state of agriculture was wretched. The methods pursued were those of the early Middle Ages, want was the chronic condition of the working population, famine a frequent phenomenon, and mendicancy increased to an enormous extent. In 1777 there were one and a quarter million beggars in France. Rioting was frequent and the criminal class drew recruits in plenty from among the proletariat of town and country.

Against the critical and utilitarian spirit of the eighteenth century, the irrational and antiquated in Government and society could not hope to maintain itself. Absolutism was assailed by Montesquieu in his *L'Esprit des lois*, which held up the ideal of constitutional liberty as realized in Great Britain; Voltaire waged a ceaseless warfare of keenest ridicule and biting wit against the absurd and anomalous in Church, State, and society. Rapidly the conviction grew of the utter worthlessness of existing things, and of the necessity for immediate and radical change. The revolt against the actual attained its climax in Rousseau. In the face of privilege, injustice, and oppression, he invoked the law of nature to establish the equality of man. To the peasantry and the artisan class equality meant the just redistribution of public burdens; to the cultured, ambitious bourgeoisie, an equal opportunity with the nobles for sharing in the national life.

For an account of the period from 1789 to 1799, see FRENCH REVOLUTION, THE.

Bonaparte showed consummate skill in reorganizing and centralizing the Government, which had been too much localized under the Revolution. He then took the field in the spring of 1800, led an army over the Alps, and attacked the Austrians in Italy, while Moreau was intrusted with the conduct of the campaign in

southern Germany. The victories of Marengo and Hohenlinden decided the fate of the war. In 1801 the Peace of Lunéville was concluded with Austria and the German Empire, and the boundaries of France were extended to the Rhine. In the Peace of Amiens in 1802, England recognized the changes wrought by the Revolution and Bonaparte in the map of Europe. The period of respite from war was employed by the First Consul in revivifying trade and industry, and in obliterating, both in private and public life, the devastations wrought by the Reign of Terror. In 1804, after an appeal through universal suffrage to the nation, Bonaparte became Emperor, as Napoleon I. The Pope came to Paris to crown Napoleon and his wife, Josephine; a new nobility was rapidly created, and the relatives and favorites of the Emperor received vanquished kingdoms and principalities at his hands. In 1805 Napoleon assumed the title of King of Italy. Austria, who ventured to rise up against him, was overthrown, together with her ally, Russia, at Austerlitz (1805), and compelled to sign the Peace of Pressburg, by which the existence of the Holy Roman Empire was formally brought to an end. Prussia was humiliated at Jena and Auerstädt (1806), and brought to the verge of destruction; the Russians were overthrown at Friedland (1807), and the Czar was forced to enter into an alliance with the French Emperor (1807), by which the arbitrament of affairs in Europe was divided between the two. In the meanwhile, however, England, having renewed the struggle against France, had gained the complete mastery of the seas by the victory of Trafalgar (1805). Against this arch-enemy Napoleon brought to bear the united strength of Europe in an effort to destroy her commercial supremacy by a system of ruinous blockades. (See CONTINENTAL SYSTEM.) In 1807 the forces of Napoleon invaded Portugal and expelled the reigning family. In 1808 he took possession of Spain, whose inhabitants rose against him, and which became a great battlefield between the English and French. The height of Napoleon's power was attained in 1809, when the Austrians in a third war were overthrown at Wagram, and in the Treaty of Schönbrunn suffered a further loss of territory. By his marriage with the Archduchess Maria Louisa, daughter of the Emperor of Austria, Napoleon attempted to give to his throne the prestige of birth, which alone it lacked. For some years, while his military operations were confined to the Spanish Peninsula, Napoleon could devote his energies toward consolidating his government and organizing a thoroughly centralized administration. His impress on the character of French institutions has persisted to the present day; the legal system of France is based primarily on the Code Napoléon (1804), and the relations between Church and State are still largely determined by the Concordat which the Emperor concluded with the Pope in 1801. This period, however, was the poorest in respect to the literary and scientific development of the nation, for men were too much trammelled by police supervision and military discipline to exercise freedom of thought.

The disastrous Russian campaign of 1812 was the beginning of Napoleon's downfall. Of the grand army of more than 500,000 men which he led into Russia in June, only 100,000 recrossed the Niemen in December under the command of

Murat, the Emperor having hastened to France to raise new levies. Europe now rose against the conqueror. In February, 1813, Prussia entered into an alliance with Russia, and these powers were soon joined by Austria and Sweden. Napoleon defeated the Russians and Prussians at Lützen and Bautzen in May, and gained a splendid victory over the Allies at Dresden in August; but in October he was overwhelmed in the great battle of Leipzig. He was driven from Germany; France was invaded, and on March 30th Paris surrendered to the Allies.

Napoleon was compelled to abdicate and retired to the island of Elba, the sovereignty of which had been granted to him. His family were declared to have forfeited the French throne. Of all her conquests France was allowed to retain only a few strips of territory on her eastern border, together with Avignon and Venaissin. On May 3d Louis XVIII., the brother of Louis XVI., made his entry into Paris, and the period of the First Restoration began.

The conduct of the restored Bourbons was not such as to conciliate the nation; they returned loaded with debts, and surrounded by the old nobility and clergy, who had not learned to renounce their former privileges, and who looked upon the generation of Frenchmen which had arisen during their absence as their natural enemies. The hopes of a liberal government, aroused by the granting of a constitution in the *Charte Constitutionnelle* (June 4, 1814), failed of realization. A narrow spirit influenced the policy of the King, which led to the establishment of a strict censorship, the extension of the powers of the police, and the persecution of all the adherents of the Empire. The lower classes and the army, who were alike sensible of the humiliating reaction which had followed the former excitement of war and conquest, were treated by the returned émigrés with indifference and contempt. The general discontent with the monarchy afforded the exiled Emperor an opportunity of which he was not slow to avail himself. On February 26, 1815, Napoleon left Elba and on March 1st he landed in France. Crowds followed him; the soldiers of the Empire flocked around his standard, and the Bourbons fled before him. The news of his landing spread consternation throughout Europe. The deliberations of the Congress of Vienna (q.v.) were suspended; and on March 25th a treaty of alliance was signed at Vienna between Austria, Russia, Prussia, and England, and preparations were at once made to put down Napoleon and restore the Bourbon dynasty. At first the prestige of success seemed to attend Napoleon, but on June 18th he met his final defeat at Waterloo (q.v.). On July 8th Louis XVIII. reentered Paris. A week later Napoleon gave himself up to the English and was sent to the island of Saint Helena.

The Second Restoration gave occasion to many pledges of a more liberal policy on the part of Louis, but these were disregarded in the Royalist reaction that now set in. In spite of the King's promises of amnesty, many of those who had gone over to Napoleon during the Hundred Days were brought to trial before tribunals expressly instituted for that purpose. The most prominent of the victims was Ney, who was found guilty of treason, and shot December 7, 1815. A number of peers, created by Napoleon, were expelled from the Upper Chamber. In some of the prov-

inces the adherents of the Bourbons entered upon a course of violence and murder, the so-called 'White Terror.' Long after physical violence subsided, reactionary legislation went on. The suffrage law was repeatedly tampered with, until the preponderance of power had been placed in the hands of the great land-owners. In matters of public education the King was completely under the control of the clergy, who constituted the extreme party among the reactionists. In 1824 Louis XVIII. was succeeded by his brother, the Duc d'Artois, as Charles X. Ministerial incapacity, want of good faith, general discontent, and tendencies to absolutism characterized this reign, which was abruptly brought to a close by the revolution of July, 1830. With Charles X. the direct line of the House of Bourbon came to an end. Louis Philippe, Duke of Orleans, was elevated to the throne by the will of the people. The first years of the reign of this 'Citizen King,' who was the representative of the prosperous commercial and industrial classes, were disturbed by insurrectionary riots of the silk-weavers in Lyons and disturbances in Paris. Attempts on the King's life were frequent; but the progress in material prosperity made the Government popular with the bourgeoisie, and for a time it held its ground. The warlike propensities of the nation found an outlet in the conquest of Algeria (1830-47). But the determined resistance of the King to the growing demand for electoral reform led at last to open insurrection in Paris. Louis Philippe abdicated, February 24, 1848. A provisional government was at once instituted, including such men as Dupont de l'Eure, Lamartine, Ledru-Rollin, Etienne Arago, Crémieux, and Garnier-Pagès. On February 27th the Second Republic was formally proclaimed. Under the auspices of Louis Blanc the new Government proceeded at once to exert the activities of the State in behalf of the working classes, for whom it was proposed to establish national workshops. On April 27th a decree was issued abolishing slavery in the French colonies. In the meanwhile elections were held for a Constituent Assembly, which met on May 4th, and which a few days later elected an Executive Commission to conduct the affairs of the Republic. The radical Republicans (the so-called Red Republicans) and the disappointed Socialists soon manifested their hostility to the new order by a resort to arms. There were Red Republican disturbances in Paris on May 15th, and a great Socialistic uprising in the capital, June 24th-26th, in which a large mass of the Parisian populace was involved, was suppressed by General Cavaignac only after terrible bloodshed. On November 4th the Constituent Assembly completed the framing of a regular republican constitution for France, and on December 10, 1848, Louis Napoleon, nephew of Napoleon I., was elected President, entering upon his office December 20th. One of the first acts of the Administration of Louis Napoleon was the sending of a French expedition for the restoration of the temporal power of Pope Pius IX., which was accomplished in July, 1849. In May, 1849, the Constituent Assembly closed its sessions and was succeeded by the Legislative Assembly. The President betrayed the true nature of his policy by appointing on October 31, 1849, a thoroughly Bonapartist Ministry. (See NAPOLEON III.) By the famous coup d'état of December 2, 1851, he violently set

aside the Constitution, and assumed dictatorial powers. He adopted his uncle's methods in many ways, concealed his seizure of the title by a sham plebiscite, and became Emperor of the French, December 2, 1852.

Napoleon III. established a government which was virtually a perfected absolutism, veiled by the forms of a parliamentary régime and a system of universal suffrage controlled by the agents of the Emperor. There was a Senate, which was the guardian of the Constitution, and a legislative body; but the Senate was almost entirely appointed by the Emperor, and in the Lower House there was no freedom of debate. The freedom of the press was practically abolished. Force, however, could not be depended upon as a permanent sanction of legitimacy, and to secure the support of the people it was necessary for Napoleon to enter upon a brilliant foreign policy. The alliance of England and France against Russia in 1854 and the outcome of the Crimean War were personal triumphs for the Emperor. With the meeting of the Congress of Paris in 1856 that city became the diplomatic capital of Europe. The Emperor aspired now to play the rôle of arbiter of Europe. In 1859, as the champion of oppressed nationalities, he came to the aid of Italy against Austria, and as a reward obtained possession of Savoy and Nice. He failed, however, in his attempt at intervention in Poland in 1863 and in the affair of Schleswig-Holstein in the following year. Actuated, perhaps, by the dream of a French hegemony in Latin America, he seized upon the disturbed condition of Mexico as an opportunity for invading that country and establishing a dependent empire there under Maximilian of Austria. The fall of Maximilian's empire in Mexico was a fatal blow at his prestige. The defeat of Austria, in 1866, and the consequent rise of Prussia, threatened to deprive France of the leading position she occupied in European affairs. At home, the period of the Second Empire was marked by great industrial development. Stimulated by the magnificence of the Court, life took on an aspect of almost reckless luxuriousness. Vast fortunes were made in railroad building, Government contracts, and speculation. A great system of public works was carried out, including the building up of a new and beautiful Paris. (See HAUSSMANN.) The international expositions of 1855 and 1867 testified to the prosperity of the country. Nevertheless, signs of dissatisfaction were not wanting, and after 1863, in proportion as Napoleon's foreign policy broke down, discontent and criticism grew loud in France. As early as 1862 the Emperor was compelled to allow some measure of debate in the legislative bodies, and in 1867 this was largely increased. Opposition to the Empire, however, grew bolder and fiercer, until in 1869 the Emperor saw himself driven to grant a responsible Ministry. It was soon found that the responsibility of the Ministry was fictitious, and that the Emperor availed himself of its protection to cloak his own acts of personal government. The result of the appeal made to the nation in 1870, on the plea of securing its sanction for his policy, was not what he had anticipated; and the 50,000 dissentient votes given by the troops in this plebiscite revealed a hitherto unsuspected source of danger. The necessity, however, of regaining his lost prestige by a brilliant foreign policy, led him to enter

once more upon an aggressive course of action in European affairs. The question of the succession to the vacant Spanish throne precipitated a crisis between France and the Prussian Government, whose foreign policy was guided by the genius of Bismarck. Deceived by the false representations of his Ministers with regard to the efficiency and preparedness of the French Army, Napoleon allowed himself to be carried into war with a power which but recently (see SEVEN WEEKS' WAR) had revealed its surpassing military strength, and which, since its triumph over Austria in 1866, had been silently preparing for the decisive conflict with the ancient enemy of Germany. Rarely has the bubble of power been so suddenly pricked as in the case of Imperial France in 1870. (See FRANCO-GERMAN WAR OF 1870-71.) After a quick succession of utter defeats for the French, Napoleon surrendered at Sedan, September 2, 1870. On September 4th the Corps Législatif declared the Emperor and his descendants forever excluded from the throne, and created a Government of National Defense. France was proclaimed a republic. A period of stress and disorder ensued. An armistice in January, 1871, was followed by the meeting of the first National Assembly of the Third Republic at Bordeaux in February. The preliminary treaty of peace with Germany was signed at Versailles on February 26th and ratified by the National Assembly on March 1st. France agreed to cede Alsace, together with parts of Lorraine, including Metz, and to pay an indemnity of 5,000,000,000 francs. Not until the final payment of the enormous war indemnity in September, 1873, was France wholly freed from the humiliating occupation by foreign troops. In the spring of 1871 the violent outbreak of the Commune (q.v.) at Paris convulsed France. On August 31, 1871, Thiers, who had been elected Chief of the Executive by the National Assembly in February, received from that body the title of President of the Republic.

There was not for years a true republican majority in France, but the adherents of the Republic were able to hold their own because of the divisions in the ranks of the Monarchists. (See POLITICAL PARTIES, paragraph on France.) In 1873 Thiers resigned the Presidency, and Marshal MacMahon was elected by Monarchist votes, and confirmed in the Presidency for a period of seven years (the Septennate). In 1875 the Assembly adopted laws providing for the constitution of the National Legislature, the legislative power to be vested in a Senate and a Chamber of Deputies. In 1877 President MacMahon was suspected of reactionary designs; but the republican form of government was, nevertheless, greatly consolidated during his tenure of office, and continued to enjoy the increasing confidence of the nation. On the resignation of MacMahon, in 1879, Jules Grévy was elected to succeed him.

After 1879, under various changes of Ministry, the policy of the Government continued steadily republican. At the instance of Jules Ferry, a decree was issued in 1880 by which the Jesuit schools were closed, and all religious orders that would not submit to certain conditions necessary to gain the State sanction were dissolved. In 1884 the Constitution and the Senatorial electoral system were revised and put upon their present basis. Members of the royal houses

that had formerly ruled France were declared ineligible for military or civil office. In 1881 France entered upon an active colonial policy by undertaking a military expedition to Tunis and establishing a protectorate over the country. In 1883 France enforced a claim of certain rights over the northwestern part of Madagascar by taking possession of several ports. Rapidly extending its influence in spite of considerable reverses, it succeeded in establishing a protectorate over the island in 1885, and in 1896 reduced Madagascar to the rank of a French possession. The advance of France in Indo-China led to war with China in 1883-85, which resulted in the establishment of a French protectorate over Annam and Tongking. M. Grévy was re-elected in 1885, but resigned in 1887. He was succeeded by Sadi Carnot, in whose Administration the Panama Canal scandal occurred, involving many prominent men and weakening the Government.

The Carnot Administration, too, witnessed the most formidable of all the attempts made to overthrow the Third Republic. This was the agitation commenced by all the discontented elements, representing every possible shade of political opinion, and united only by their hostility to the existing Government, under the leadership of General Boulanger (1888). For a time it seemed as if the Republic was fated to fall before a coup d'état. Boulanger, however, lacked the requisite decision of character, lost his popularity, and ultimately fled the country. Orleanists, Bonapartists, and Radicals alike had contributed toward his success, and the personal revelations made by Mermeix, which revealed the true character of Boulanger, not only discredited the opposition, but caused a very strong reaction in favor of the Government. This growth of republican sentiment received an additional impulse in 1891, when Cardinal Laviege, the head of the Clerical Party in France, declared himself in favor of the Republic. This declaration was a great blow to the Royalists, whose chief strength has always lain in their connection with the Church. In 1894 President Carnot was assassinated at Lyons by an Italian anarchist, and was succeeded by Casimir-Périer, who resigned in January, 1895, and was succeeded by Félix Faure. The strengthening of the Franco-Russian *entente* was the most notable fact of these years, and after that the Dreyfus case. (See DREYFUS.) Emile Loubet was elected President in 1899, upon the death of President Faure. A detailed account of the last twenty years of French political history will be found under POLITICAL PARTIES.

Jahrhunderts* (Berlin, 1886); Lévasséur, *La population française* (Paris, 1889-92); Hassall,

The French People (London, 1892); Acloque, *Faune de France* (ib., 1896 et seq.); Coste, *Flore descriptive et illustrée de la France* (ib., 1901 et seq.); Lacroix, *Minéralogie de la France et de ses colonies* (ib., 1893-94); Meunier, *Géologie régionale de la France* (ib., 1889); Risler, *Géologie agricole* (ib., 1884-97); Delebeque, *Les lacs français* (ib., 1898); Leroux, *Le massif central* (ib., 1898); Lallemand, *Le nivellement général de la France* (ib., 1899); Loua, *La France sociale et économique* (ib., 1888); Foville, *La France économique* (ib., 1889); Dubois, *Géographie économique de la France* (ib., 1898); Jones, "The Economic Life of France," *Popular Science Monthly*, January, 1901, a survey of the economic geography of France; Goldstein, *Bevölkerungsprobleme und Berufsgliederung in Frankreich* (Berlin, 1900); Blondel, *La France et le marché du monde* (Paris, 1901), a discussion of the causes of the stationary state of French commerce; Aubert, *A quoi tient l'infériorité du commerce français?* (Paris, 1900), which dwells on the commercial possibilities of the French colonial possessions; Kaufmann, *Die Eisenbahnpolitik Frankreichs* (Stuttgart, 1896), of which the French translation, entitled *La politique française en matière de chemins de fer* (Paris, 1900), is supplemented by a study of the question by Hamon, assistant chief of the Bureau of the French Ministry of Finance, bringing the material to date; Seligman, "The French Colonial System," in *Essays in Colonial Finance*, publication of the American Economic Association (New York, 1900); Des Essars, "Banking in France," in *A History of Banking in All the Leading Nations*, vol. iii. (ib., 1896); Boucard and Jèze, *Éléments de la science des finances et de la législation financière française* (2d ed., Paris, 1900); Lebon, *Das Staatsrecht der französischen Republik* (Freiburg, 1883 et seq.); Aucoc, *Conférences sur l'administration et le droit administratif* (Paris, 1882-86); Burgess, *Political Science and Constitutional Law* (Boston, 1890); Goodnow, *Comparative Administrative Law* (New York, 1893); Brie, *Die gegenwärtige Verfassung Frankreichs* (Breslau, 1892); Viollet, *Histoire des institutions politiques et administratives de la France* (Paris, 1898); Block, *Dictionnaire de l'administration française* (ib., 1898), with annual supplements.

The historical literature relating to France is extensive. Of general works the best are Duruy, *Histoire de France* (trans. by Carey, New York, 1889); Martin, *Histoire de France* (Paris, 1855-60); Guizot, *Histoire de France* (Paris, 1870), appearing simultaneously in French and English; Kitchin, *History of France to 1793* (Oxford, 1881-82.). Bibliographies for special periods may be found in Lavissee and Rambaud, *Histoire générale* (Paris, 1893-1900); Adams, *Manual of Historical Literature* (New York, 1888); Monod, *Bibliographie de l'histoire de France* (Paris, 1888), and under special titles relating to French history in this Encyclopædia. For the period of the Reformation, Baird's histories of the Huguenots are of great value. For the seventeenth, eighteenth, and nineteenth centuries, consult Sorel, *Lectures historiques* (Paris, 1894). There is a mass of writings relating to the Revolution and the Napoleonic period. The most scholarly work in English is Morse-Stephens, *History of the French Revolution* (New York and London, 1886). Other works of authority are Adams, *Democracy and*

Monarchy in France (New York, 1884); Von Holst, *The French Revolution, Tested by Mirabeau's Career* (Chicago, 1894); Morse-Stephens, *Orators of the French Revolution* (Oxford, 1892). Valuable especially for the relation of the Revolution to European affairs are Sorel, *L'Europe et la révolution française* (Paris, 1892); and Sybel, *History of the French Revolution* (trans. by Perry, London, 1867-69). Thiers, *Histoire de la révolution française* (15th ed., Paris, 1881) and *Histoire du consulat et de l'empire* (Paris, 1845-69), are still important, though it is now recognized that in both the account is highly colored by the strong predilections of the distinguished author. The works of De Tocqueville, Louis Blanc, Taine, Mignet, and Arthur Young are also to be quoted in this connection. For works relating especially to Napoleon, see NAPOLEON I. On France in the nineteenth century the leading authorities are, for external affairs: Viel-Castel, *Histoire de la restauration* (20 vols., Paris, 1860-78); for internal affairs, Hauranne, *Histoire du gouvernement parlementaire en France, 1814-1848* (Paris, 1860-72), covering the period to 1830; Hillebrand, *Geschichte Frankreichs* (Gotha, 1877-79), to 1830, monarchical in tone but scientific; Thureau-Dangin, *Histoire de la monarchie de juillet* (Paris, 1887-92), monarchical, but containing many new facts; De la Gorce, *Histoire de la seconde république française* (Paris, 1887); Delord, *Histoire du second empire* (Paris, 1870); Bulle, *Geschichte des zweiten Kaiserreichs und des Königreichs Italien* (Berlin, 1890), a popular but careful study in the well-known Oncken series; Zevort, *Histoire de la troisième république* (Paris, published to 1898), a valuable scientific history; Coubertin, *The Evolution of France Under the Third Republic* (trans. by Hapgood, New York, 1897), a useful and interesting work by one of the most liberal and catholic-minded of French scholars and men of affairs. For additional and specialized references, consult bibliography in Seignobos, *Political History of Europe Since 1814* (trans. by Macvane, New York, 1900). For a detailed treatment of periods and events in French history, see under the names of persons, parties, and places, as well as of specific occurrences mentioned in the text, as LOUIS XIV.; DANTON; GIRONDISTS; BRUMAIRE; NAPOLEON I.; AUSTERLITZ; ALGERIA; COMMUNE, etc.

FRANCE, ISLE OF. See MAURITIUS.

FRANCE, REFORMED CHURCH OF. See HUGENOTS.

FRANCE, fräns, ANATOLE (1844—). The assumed name of Jacques Anatole Thibault, a noted French critic, a distinguished novelist and the most graceful humorist of contemporary France. His early poems (1873 and 1876) are negligible, as is the humorous story, *Jocaste et le chat maigre* (1879), but *Le crime de Sylvestre Bonnard* (1881, often translated) is a charming idyl of child and scholar's life, full of genial irony that grows more caustic in *Balthazar* (1889), while in *La pâtisserie de la reine Pédaque* (1893), and *Opinions de M. l'abbé Jérôme Coignard* (1893), the story is little more than a veil for the expression of an epicurean skepticism. His latest stories, *L'orme du mail* (1897), *Le mannequin d'osier* (1898), *L'anneau d'améthyste* (1898), *Monsieur Bergcret à Paris*

(1900), frankly call themselves *Histoire contemporaine* and seek to reflect the thoughts of typical Frenchmen of culture. All these and his other novels as well, e.g. *Thaïs* (1890), *Le lys rouge* (1894), are the fiction of a critic rather than of a romancer, and his journalistic reviews, *La vie littéraire* (5 vols., 1888-93), as well as his philosophic *Le jardin d'Épicure* (1895), show more of the spirit of Renan than that of any other; yet France has in him something, too, of Racine, of Voltaire, and of Flaubert. France is perhaps "the ultimate flowering of the French genius," as Lemaitre, himself a great critic, has said of him.

FRANCE, JOSEPH (1787-1869). A French publicist and reformer, born in Lorraine. He entered the army in 1815, obtained a commission in the gendarmerie in the West Indies, and was stationed in Martinique, where he rose to the rank of colonel in 1834. From 1836 to 1846 he had supreme command of the military police in the island, and by his humanity, impartiality, and firmness endeared himself to the lower classes of the population, and to the slaves in particular, who looked upon him as their champion. To this title he actually won the right when, in 1841, he published *La vérité et les faits, ou l'esclavage à nu*, in which he set forth the cruelties of the colonists toward the negroes. This work created such a sensation that the Governor, fearing its effects, removed France from his command, and sent him a prisoner to Paris to stand trial for publishing seditious writings. This trial resulted in his losing permanently his commission, but, after the Revolution of 1848, and the abolition of slavery in the colonies, France was chosen by the electors in Martinique to represent them in the Constituent Assembly at Paris. From 1852 until his death he was a member of the colonial council of Martinique. Besides numerous contributions to the *Revue Abolitioniste*, he published *Histoire de la Guadeloupe* (1885); *Les corsaires français dans les Antilles* (1857); *Histoire de la filibuste* (1860); *Questions coloniales* (1860); and *Statistique physique et politique de la Martinique* (1861).

FRANCESCA, frân-chês'kâ, PIERO DELLA (c.1420-92). An Italian painter of the Umbrian School, whose real name was Pietro di Benedetto de' Franceschi. He was born at Borgo San Sepolero. His work shows the influence of Paolo Uccello (q.v.), and he was an assistant of Domenico Veneziano, from 1439 to 1450, in the painting of the frescoes in the churches of San Egidio and Santa Maria Nuova, Florence. Upon an invitation to Rome by Nicholas V., he painted two frescoes which were destroyed when Raphael painted the Stanze of the Vatican. In 1451 he painted a fresco in the Church of San Francesco at Rimini for Sigismondo Malatesta. He was also invited to Ferrara and assisted in the decoration of the Schifanoia Palace. Francesca was a complete master of oil painting; he was the first to use light to give a subduing effect in color, and to preserve the real value of shadows. There is a dignity in his portraiture: an absence of emotion and a solemnity about his figures. As a student of linear and aerial perspective, he was a forerunner of Leonardo da Vinci, especially in his studies of light and shade and his space values. Two of his most noted pupils were Luca

Signorelli and Melozzo da Forlì. He died October 12, 1492, and was buried in the cathedral of his native place. Some of his principal works are: "Saviour Rising from His Tomb," museum at Borgo San Sepolcro; altar-piece, "Virgin and Child," Church of the Misericordia at Borgo San Sepolcro; "Nativity," unfinished, at the National Gallery, London; a number of works at Florence, Perugia, and Venice. Consult: Müntz, *Le tour du monde* (Paris, 1883); Vasari, *Vite*, ed. by Milanesi (Florence, 1878-85), English translation, Blashfield and Hopkins (New York, 1897); and Waters, *Piero della Francesca* (London, 1901).

FRANCESCA DA RIMINI, dà rě-mě-ně (†c. 1288). The daughter of Guido da Polenta, the Lord of Ravenna. She was given by him in marriage to Giovanni, sometimes called Gianciotto, or Sciancato (the Lame), the second son of Malatesta, the podestà of Rimini. Malatesta was a Guelph leader who had made himself the master of all the region about Rimini. He had, besides Giovanni, a son, Paolo, called the Handsome, whom Giovanni sent to Ravenna to bring back his bride. Francesca and Paolo fell in love, and Giovanni, finding them together, killed them both (c.1288). The tale has many modifications, but this is the simplest outline of the story. It has been made the subject of many pictures and plays. The best known of the pictures are "Paolo and Francesca," by Ingres (1819), in the Antwerp Museum; the same by Ary Scheffer (1835), in the Wallace collection; the same by G. F. Watts (1879), and the "Death of Paolo and Francesca," by Cabanel (1870), in the Luxembourg. Besides Dante and Boccaccio, Leigh Hunt made this story the subject of a poem (1816), Silvio Pellico wrote a tragedy on it (1818), G. H. Boker made an acting version of it (1864), and recently Stephen Phillips produced a dramatic poem (1899), and the Italian poet d'Annunzio a drama (1901). There is an opera of this name by Hermann Götz (1877), which was completed by G. Frank, a symphonic poem for orchestra by Tchaikovsky (1877), and an opera by Ambroise Thomas, *Francesca da Rimini* (1882). Consult Uriarte, *Francesca da Rimini, dans la légende et dans l'histoire* (Paris, 1882).

FRANCESCHINA, frān'chēs-kě'nā. The finely drawn chief character in Marston's *Dutch Courtesan*. She is a woman who, with all her attractiveness, is revengeful and implacable.

FRANCESCHINI, frān'chēs-kě'ně, BALDASSARE (1611-89). An Italian painter of the Florentine School. He was born at Volterra, and is also called Volterrano Giuniore, to distinguish him from Daniele da Volterra. He was a pupil of Cosimo Roselli and Giovanni di San Giovannino in Florence, and afterwards studied the antique in Rome. He was a very facile painter, but, like the rest of the Mannerist group, was deficient in technique and in sentiment. His works are principally in Florence, where he painted in the Pitti Palace and in the Uffizi, and at Volterra, especially in the Convent of Santa Radia di San Giusto. His masterpiece is the "Coronation of the Virgin," in Santa Annunziata, Florence.

FRANCESCHINI, frān'chēs-kě'ně, MARCAN-TONIO (1648-1720). An Italian painter, born at Bologna. He studied under Galli and was the

pupil and friend of Carlo Cignani, and worked with him at Bologna, Modena, Reggio, and elsewhere. One of his greatest paintings, a fresco at the Council Palace in Genoa, representing scenes from the history of the Republic, was destroyed. Others of his large decorative works are frescoes in the Pallavicini and Durazzo palaces in Genoa, and a ceiling in the Ranazzi Palace in Bologna. He was invited to Vienna, and there painted in the Lichtenstein Palace frescoes with scenes from the life of Jacob and Rachel. Franceschini was in many ways a remarkable artist; he had a genius for composition, and all that was mannered and artificial in his imitators was redeemed in him by the fertility of his imagination and the warmth of his color. His easel pictures include "The Annunciation," Bologna gallery; "Birth of Adonis," and "The Magdalen," Dresden gallery; "San Carlo Borromeo Helping the Plague-Stricken," and "Diana," in the Vienna gallery.

FRANCESCO DI PAOLA, frān-chēs'kó dē pou'lā. See FRANCIS OF PAOLA.

FRANCHE-COMTÉ, frānsh' kōn'tā' (Fr., free county). An old province in the east of France, in the basin of the Rhône, comprising what now forms practically the departments of Doubs, Haute-Saône, and Jura, and part of the Department of Ain. It was inhabited in ancient times by the Sequani, and was the *Maxima Sequanorum* of the Romans. In the fifth century it was conquered by the Burgundians, and later formed part of the Frankish monarchy. It passed afterwards through various hands, until, in 1156, it came into the possession of the Emperor Frederick Barbarossa. In 1384 it was annexed by Philip the Bold of Burgundy. Through the marriage of Mary of Burgundy to Maximilian, Franche-Comté became a possession of the Hapsburgs, and, together with the Netherlands, it passed to the Spanish branch of that house. The acquisition of the region was one of the chief objects of Louis XIV.'s external policy; his armies overran the province in 1668 and 1674, and he was confirmed in his conquest by the Treaty of Nimeguen (1678). The name first appears in the twelfth century, and indicates freedom from Imperial taxation, except the annual gift to the sovereign of a stipulated sum. Its old capital was Besançon.

FRANCHETTI, frān-kět'tē, BARON ALBERTO (1860-). An Italian operatic composer, born at Turin. He was a pupil of Nicolò Coccon and Fortunato Magi. Proceeding to Dresden, he studied under Draeseke, after which he entered the Munich Conservatory. He belongs to the new school of Italian composers, and is regarded as one of its most successful exponents. His principal and most important opera was the four-act drama legend *Asraële*, produced in 1888. Other and scarcely less successful operas are: *Cristoforo Colombo* (1892); *Fior d'Alpe* (1894); *Il signor di Pourceaugnac* (1897). He also wrote many smaller works, the best of which is a symphony in E minor.

FRANCHEVILLE, frānsh'vél', or **FRANQUEVILLE**, frānk'vél', PIERRE (1548-c.1618). A French sculptor, born at Cambrai. Against his parents' wishes he went to Paris in 1564 to study art, and, recalled home to follow a literary career, left his country secretly, making his way to Germany and Austria.

At Innsbruck he found a patron in the Archduke Ferdinand, who enabled him to study under Giovanni da Bologna at Florence. He assisted that famous master in many of his works; also accompanied him to Genoa, where the statues of "The Four Evangelists," in the cathedral, bear witness to his early proficiency. The rapidly increasing reputation acquired by such works as the "Allegorical Figures of Humility, Chastity, and Wisdom," in the Nicoline Chapel at Florence, led to his being summoned to Paris in 1601 by Henry IV., who appointed him Court sculptor. In that capacity he executed numerous statues, busts, and vases for the royal palaces and gardens. Prominent among these are "David with the Head of Goliath" (1612); "The Conquered Nations" (1614), four figures, formerly part of the equestrian monument of Henry IV.; and "Orpheus," all in the Louvre. He was a man of great versatility, and active as an architect, painter, and writer.

FRANCHI, frāŋ'kê, AUSONIO (1821-95). The pseudonym of Cristoforo Bonavino, an Italian philosopher, born at Pegli, near Genoa. He was ordained a priest, but abandoned this career, and gave himself to the study of philosophy, under the name of Franchi, by which he was always known. He became professor at the University of Padua in 1860, and at the Academy of Milan in 1863. Among his works are: *La filosofia delle scuole italiane* (1863); *La religione del secolo XIX.* (1860); *Del sentimento* (1854); *Il razionalismo del popolo* (1862); *Saggi di critica e polemica* (1871); and *Lettere su la teoria del guidizio* (1870).

FRANCHI, FABIAN and LOUIS DEL. In Boucicault's drama *The Corsican Brothers*, the twin brothers whose mysterious sympathy is the basis of the play.

FRANCHISE. In England, a royal privilege, or branch of the Crown's prerogative, subsisting in the hands of the subject. Being derived from the Crown, franchises must arise from royal grant, or in some cases may be held by prescription, which presupposes a grant. The subjects of franchise correspond with what in Scotland are called regalia (q.v.). The right to take waifs, estrays, wrecks, treasure-trove, royal fish, and forfeitures, all of which are the prerogatives of the Crown, are franchises. The rights of forest, chase, park, warren, and fishery are also franchises, no subject being entitled so to apply his property for his own convenience. A county palatine (see PALATINATE) is the highest species of franchise; as within it the earl, constable, or other chief officer may exercise without control the highest functions of the sovereign. And as the Crown may thus erect an entire county into an independent jurisdiction, so it may create a liberty of bailiwick independent of the sheriff of the county, and bestow the privilege as a franchise. It is likewise a franchise for a number of persons to be incorporated, and subsist as a body politic, with a power to maintain perpetual succession, and do other corporate acts; and each individual member of such corporation is also said to have a franchise or freedom. The right to hold a fair or market, or to establish a ferry and to levy tolls therein, is also a franchise. Where the holder of a franchise is disturbed in his right he may sue for damages by an action on the case; or in the case of non-payment of tolls he

has the remedy of distress (q.v.). Viewed as property a franchise is an incorporeal hereditament (q.v.), and contains an implied covenant on the part of the Government not to abrogate or invade the right vested by it in the grantee, and on the part of the latter to perform all the duties which it imposes, and to exercise his right and privileges under it in a faithful and reasonable manner. When a franchise is granted on a valuable consideration, as in the case of a private corporation, it is in the nature of a contract between the Government and the grantee, and is protected from legislative interference in this country by constitutional provisions prohibiting the enactment of laws which impair the obligation of contracts. (See DARTMOUTH COLLEGE CASE.) On the other hand, the franchise is affected with a *jus publicus*, which secures to the State the power of regulating the conduct of a corporation, and even of destroying it by way of punishment for any grave abuse of its privileges.

As a political term, franchise denotes the right of suffrage. In England the qualifications of voters for members of Parliament are quite different from those of voters at municipal and other local elections. In this country the conditions of elective franchise are generally, though not always, the same for Federal, State, and municipal purposes. Consult: Pollock and Maitland, *History of English Law* (2d ed., London, 1899); Kent, *Commentaries*; *Encyclopædia of the Laws of England*; Taylor, *Treatise on the Law of Private Corporations* (New York, 1902).

FRANCIA, frān'châ (1450-1518). An Italian painter, goldsmith, and sculptor of the Early Renaissance, whose real name was Francesco di Marco Raibolini. He was the chief master of the early Bolognese School of Painting (q.v.). He was born at Bologna, the son of a carpenter, and until his fortieth year practiced the goldsmith trade. In this he achieved high distinction, having been repeatedly steward of the goldsmiths' guild, and in 1514 steward of the Four Arts. He was famous as a medalist and as a worker in niello. Two charming niello plates at the Academy of Bologna are ascribed to him, as is also a small relief portrait of Giovanni II. Bentivoglio in San Giacomo Maggiore. The ruling house of Bentivoglio named him master of the mint, and upon its expulsion Pope Julius II. confirmed him in this office.

Francia's earliest dated paintings (1490) show the influence of Lorenzo Costa, who was then at Bologna, and who probably taught him painting. The metallic character of his first pictures, and their strong outlines, point to his former profession. But Francia soon outgrew his colleague, both in color and in drawing, although Costa was more imaginative and dramatic. There also appears in his works a sentiment reminiscent of the Umbrian masters.

Among his earlier paintings are a "Madonna," in the Museum of Berlin, and a dead "Saint Stephen," in the Borghese Palace, Rome. The Pinacoteca of Bologna has a fine "Madonna Enthroned," a "Nativity," and a "Dead Christ"; the Brera (Milan), an "Annunciation"; the Louvre, a "Crucifixion, with Job"; Berlin, a "Virgin in Glory" (1502). The "Virgin in a Rose Garden Adoring the Christ-Child," in the Munich Gallery, a picture of highest poetic

charm, and well executed, is probably by him, although Morelli ascribes it to Francia's pupils. Another fine example of his work is the Bentivoglio altarpiece in San Giacomo Maggiore, Bologna.

All of his paintings, though charming in sentiment, lack dramatic action; they are groups of charmingly isolated figures, rather than connected compositions. Nevertheless, in his later works we find a vein of dramatic action, and an increased nobility of form and conception. These are due, to some extent, to the influence of Raphael. The reputed correspondence between Francia and Raphael and Francia's sonnet to the master are forgeries of a later date, but Francia may well have seen works of Raphael at Bologna. Among the works showing the influence of Raphael are the "Virgin Enthroned" in the National Gallery (London); the "Coronation of the Virgin," in the Cathedral of Ferrara; and the "Assumption of the Virgin," in San Frediando, Lucca. Other examples are the "Deposition from the Cross," in the Parma Gallery; the "Adoration of the Kings," at Dresden; and a portrait of an "Unknown Man" attributed to Raphael, in the Lichtenstein Gallery, Vienna. His frescoes in the Oratory of Santa Cecilia, Bologna, representing the "Marriage of the Saint with Saint Valerian" and her "Burial," are among the finest of his works.

Francia was much grieved by the exile of the Bentivogli in 1506. He was patronized by Pope Julius II., and remained at Bologna. His style underwent no change, but his last works show decline. He died at Bologna, January 5, 1518.

Francia's sons, GIACOMO (died 1557) and GIULIO (1487-1543), painted in their father's manner, but were much inferior to him. They worked together, signing their works J. J. Francia, and examples of their joint efforts exist in the Galleries of Bologna, Parma, and Berlin. Giacomo, who was the better painter, subsequently came under the influence of Dosso Dossi (q.v.). Specimens of his independent work are in the Museum of Berlin, the churches and Gallery of Bologna, and in the Brera, Milan.

Consult: Vasari, *Vite dei Pittori*, etc., ed. Milanesi, vol. ii. (Florence, 1878-85); English translation by Blashfield and Hopkins, vol. ii. (New York, 1897); Cartwright, *Mantegna and Francia* (London, 1881); Morelli, *Italian Painters* (London, 1892-93); Woltmann and Woermann, *History of Painting*, vol. ii. (Eng. trans., New York, 1901).

FRANCIA, frän'sé-á, JOSÉ GASPÁR RODRÍGUEZ (1760?-1840). Dictator of Paraguay. He was born at Asunción, and was the son of a small landed proprietor of Portuguese origin. He was intended by his parents for the Church, and took his degree as Doctor of Divinity at the University of Córdoba de Tucumán, but subsequently adopted the profession of law and gained considerable distinction as a jurist and public official. When the revolution against Spain broke out at Buenos Ayres in 1810, Paraguay at first seemed disinclined to favor the Liberal cause, but finally it joined the movement for liberation and in 1811 proclaimed its independence. Francia took a leading part in the revolution, and was made secretary of the Government Junta. He was the one man of ability among an ignorant population and was so hampered by his col-

leagues that he resigned his position, only to come forward into still greater prominence when the incapacity of the governing body had precipitated a counter-revolution. In 1813 he was appointed joint consul with General Yegros. The latter was a man of little intellect and energy, and Francia was, in fact, sole ruler from the first. In 1814 he was made dictator for three years, and in 1817 the dictatorship was given him for life. Under Francia's despotic sway, which was at times that of a bloody tyrant, the condition of Paraguay rapidly improved. The extraordinary system of non-intercourse with other nations which he enforced benefited Paraguay in diversifying her industries and forcing her farmers to develop the resources of the soil to the utmost in order to supply the home market. Francia introduced schools, repressed superstitious observances, and enforced strict justice in the courts, but he kept his subjects in a state of cruel bondage and lived in perpetual fear of assassination. Rengger and Longchamp, two Swiss surgeons whom Francia held as prisoners from 1819 to 1825, gave an account of the dictator in their *Essai historique sur la révolution de Paraguay et le gouvernement dictatorial du docteur Francia* (Paris, 1827). Consult also the works of J. P. and W. P. Robertson: *Letters on Paraguay* (London, 1838); *Francia's Reign of Terror* (London, 1839); *Letters on South America* (London, 1843).

FRANCIABIGIO, frän'shá-bé'jò (an abbreviation of Francesco di Cristofano Bigi (1482-1525). A Florentine painter, of the High Renaissance. He was a pupil of Albertinelli (q.v.), but was influenced to a far greater extent by Andrea del Sarto, with whom he lived and worked. Among the works of his early period, showing the influence of Albertinelli, are the "Virgin with Job and Saint John," and "Calumny," after Lucian's description of a picture by Apelles, both in the Uffizi (Florence); the "Madonna del Pozzo," in the same gallery, usually ascribed to Raphael, has also been attributed to him. He assisted Andrea del Sarto in most of his frescoes. Among their joint works was a series representing the "Life of the Virgin," in the Convent of the Servites, Florence. One of this series, the "Marriage of the Virgin," is Franciabigio's best work, although mutilated by the artist himself, who was enraged at its premature unveiling by the friars. Of the series of frescoes of the "Life of John the Baptist," in the Convent dello Scalzo, he executed two: "Departure of John for the Desert," and "Meeting of John and Jesus." Among his other canvases are the "Temple of Hercules," in the Uffizi, and the "Story of Bathsheba" (1523), at Dresden. They are of marked individuality and fine color, and excellently modeled. The best known are portraits of young men. There is a fine specimen in the Pitti Palace, and another, perhaps of himself, in the Palazzo Capponi, Florence. Others are in the Berlin Museum (1532) and the National Gallery, London; the one at Windsor Castle is usually ascribed to Andrea del Sarto.

FRANCILLON, frän'sé'yón'. The title of a play by the younger Dumas. It belongs to the most lively and rapid of his comedies.

FRAN'CILLON, ROBERT EDWARD (1841-). An English journalist and novelist. He was born at Gloucester, England, March 25, 1841, was edu-

cated at Trinity Hall, Cambridge, and was admitted to the bar in 1864. From 1872 to 1894 he was on the staff of the *London Globe*. His first novel, *Grace Owen's Engagement*, appeared in *Blackwood's Magazine* in 1868. Among his many other novels are *Olympia* (1874), and *A Dog and His Shadow* (1876). He has also written songs and poems.

FRAN'CIS. (1) A friar in Shakespeare's *Much Ado About Nothing*. (2) A 'drawer' at the Boar's Head Tavern, Eastcheap, in Shakespeare's *Henry IV., Part I.*, whom Prince Hal and Poins plague by both calling him at the same time "till his tale was nothing but—Anon."

FRANCIS I. (1708-65). Holy Roman Emperor from 1745 to 1765. He was the son of Leopold, Duke of Lorraine, and in 1729 succeeded his father in the duchy. In 1735 he ceded Lorraine to Stanislaus Leszczynski, father-in-law of Louis XV., to revert after his death to the Crown of France, obtaining in return the succession to the Grand Duchy of Tuscany, whose native rulers, the Medicean family, were about to die out. In 1736 he married Maria Theresa of Austria, the only daughter and heiress of the Emperor Charles VI., and in the following year became Grand Duke of Tuscany. In 1740 Charles VI. died, and Maria Theresa succeeded him as ruler of the Austrian possessions. She made her husband co-regent with herself, but gave him little share in the administration. In the wars carried on against Frederick the Great Francis took little personal share. In 1745 he was elected Holy Roman Emperor and was crowned at Frankfort, October 4th. The Famous Seven Years' War (1756-63) now broke out between Austria and Prussia, but the cares which it imposed fell mainly upon the great-hearted Maria Theresa, while Francis chiefly concerned himself with amassing a huge private fortune. He died August 18, 1765, at Innsbruck. His son Joseph succeeded him in the Imperial dignity, but Maria Theresa retained in her hands the sovereignty of the Austrian dominions till her death (1780). Consult: Seyfart, *Leben Franz' I.* (Nuremberg, 1766); Arneth, *Geschichte Maria Theresias* (Vienna, 1863-79).

FRANCIS II. (1768-1835). Holy Roman Emperor from 1792 to 1806, and ruler of the Austrian dominions from 1792 to 1835 (with the title of Emperor of Austria from 1804). He was the eldest son of the Emperor Leopold II., and of Maria Louisa, daughter of Charles III., King of Spain, and was born at Florence, February 12, 1768. In 1790 his father, previously Grand Duke of Tuscany, became Emperor on the death of his brother Joseph, and on his death, March 1, 1792, was succeeded in the hereditary Austrian dominions by Francis, who, in July, was elected to the Imperial throne of Germany. His reign began at a time when the progress of the French Revolution was exciting the alarm of the Old European dynasties. Austria was in alliance with Prussia against the Republic, and the allied armies invaded France, but were driven back. In 1794 the French arms carried all before them in Belgium. In 1795-96 the war between France and Austria raged fiercely on German soil. In 1796 Bonaparte swept through northern Italy and in 1797 Austria was invaded. Francis was forced to conclude the Treaty of Campo Formio October 17, 1797, by

which Austria surrendered Belgium and Lombardy, receiving in return most of the dominions of the extinguished Republic of Venice. Two years afterwards Francis, in alliance with Russia and England, again took up arms, and was at first successful; but the recall of the Russian general, Suvaroff, and the return of Bonaparte from the East turned the tide. The victories won by Bonaparte at Marengo and by Moreau at Hohenlinden broke the power of Austria, and Francis was compelled to sue for peace. By the Treaty of Lunéville in 1801, France was confirmed in the possession of the left bank of the Rhine. In 1804 Francis assumed the title of Emperor of Austria. In 1805 he entered into a new alliance with Russia; but the contest with France ended more disastrously than ever for the Austrians. The French victory at Austerlitz completely humiliated Francis, who, at the Peace of Pressburg, in December, 1805, was obliged to surrender the Venetian territories and Tyrol. The Holy Roman Empire was now dissolved, after lasting for a thousand years, and Francis was henceforth known as Emperor of Austria and King of Bohemia and Hungary. In 1809 he recommenced the war with Napoleon. The battle of Aspern or Essling was an Austrian victory, though not a decisive one, but Napoleon triumphed again at Wagram, and dictated terms of peace from the Palace of Schönbrunn in October of the same year, wresting from the Hapsburgs a large portion of their ancient hereditary territories, out of which the conqueror created the dominion of the Illyrian Provinces. In 1810 the French Emperor married the daughter of Francis, Maria Louisa. A permanent friendly alliance now seemed to be concluded between the two empires; and during the Russian campaign of 1812 the Austrians rendered the French some slight assistance. After the destruction of the French army of invasion in Russia, Francis, who had exerted himself fruitlessly to mediate between France and Russia, suddenly joined the allies, helped to win the battle of Leipzig, and with the Russians and Prussians advanced to Paris in 1814. Immediately after the first abdication of Napoleon the Congress of Vienna was assembled for the reconstruction of the political system of Europe. (See AUSTRIA-HUNGARY.) Francis joined Alexander I. of Russia and Frederick William III. of Prussia in the formation of the Holy Alliance (q.v.), and the reactionary and absolutistic ideas embodied in that contract characterized the policy during the remainder of his reign. Its guiding spirit and his constant counselor was Metternich (q.v.). Francis died on March 2, 1835. Consult Meynert, *Franz I.* (Vienna, 1871-73).

FRANCIS I. (1494-1547). King of France 1515 to 1547. He was the son of Charles, Count of Angoulême, and was born at Cognac, September 12, 1494. In his youth he received a thorough military training consistent with his rank and position. At the age of twenty he married Claude, daughter of Louis XII., and succeeded his father-in-law January 1, 1515. He immediately entered upon the task of reconquering Milan, which had been wrested from his predecessor two years before. At the head of 40,000 men Francis crossed the Alps and attacked the Swiss allies of the Milanese at Marignano, completely defeating them with a loss of 12,000 men, September 13

and 14, 1515. On the field of battle Francis accepted knighthood from the renowned Bayard. After some further successes he returned to Paris in 1516. On the death of the German Emperor Maximilian in January, 1519, Francis I. and Charles of Spain became rival candidates for the Imperial crown. The election of Charles excited the anger of the French King, who immediately prepared for war, and endeavored to secure the alliance of Henry VIII. of England, but with no success, Henry instead forming an alliance with the Pope and the Emperor against Francis. The forces of Francis I. were driven out of Italy; the English and Imperialists invaded France; the Constable de Bourbon, who was discovered to be conspiring against his sovereign, fled to Charles, who gladly accepted his services. An attempted invasion of Italy by the French failed, and the Imperialists advanced into Provence. On the approach of the French King they withdrew into Italy, where they were followed by Francis, who overran Lombardy, but was totally defeated and taken prisoner at the battle of Pavia, February 24, 1525. Charles carried his captive to Madrid, and only granted him his liberty on the hardest conditions. He was forced to renounce the sovereignty of Flanders and Artois, the Duchy of Burgundy, and all his Italian possessions; to promise the restoration of the Constable de Bourbon to his former dignities; and to surrender his two sons as hostages. Francis obtained his freedom March 17, 1526; but his first act, on his return to his dominions, was a refusal to fulfill the pledges he had given. Pope Clement VII. absolved him from his oath; England, Rome, Venice, Florence, and Genoa—all of whom were growing alarmed at the immense power of Charles—withdrew from the Imperial alliance and sided with his antagonist. The war in Italy now recommenced. On May 6, 1527, the Imperial forces of the Constable de Bourbon stormed and sacked Rome and captured the Pope. A French army under Lautrec was sent into Naples, but after a series of brilliant successes was almost wholly cut off by disease. About the same time Francis sent a challenge to Charles to decide their quarrel by single combat. The challenge was accepted, but the duel never took place. Peace was concluded at Cambrai in August, 1529, to the great advantage of the Spaniards. In 1536, however, war broke out again between the French and the Emperor, the French having overrun Savoy, to which Francis laid claim, and whose Duke was the ally of Charles V. Little definite result ensued, but the war was marked by an alliance between Francis and the Turks. Finally, by the efforts of Pope Paul III., a truce was concluded for ten years at Nice, between Charles and Francis, June 18, 1538. In point of fact, however, peace lasted only four years, and in 1542 the French King put into the field five different armies against the Emperor, who had just been repulsed by the Moors of Algiers. The battle of Ceresole, April 14, 1544, in which the French were completely victorious, partially wiped out the dishonor of the defeat at Pavia, but a second alliance with the Turks renewed the indignation of the Christian powers. Charles V. and Henry VIII. of England marched upon Paris, and Francis was compelled to make peace with the Emperor at Crespy, September 18, 1544. The war with England continued till 1546. Francis died at Rambouillet, March 31, 1547. Gay

and voluptuous, Francis was still capable of heroic impulses and acts of splendid generosity. He was a generous patron of the artists of the Renaissance, several of whom were to be found at the French Court. Libraries, schools, and colleges were founded and learning encouraged. His persecution of the Vaudois and other Protestant sects, however, has left a dark stain on his memory.

BIBLIOGRAPHY. Consult the general histories of Michelet, Martin, and Ranke, all of which give a good account of the reign of Francis I. There is no good single work on his reign, the most complete, Gaillard, *Histoire de François I.* (Paris, 1769), being out of date. Of existing works in French the best are: Paris, *Etudes sur François Ier* (Paris, 1885), a work dealing largely with the social life of the times; Mignet, *Résumé de François Ier et Charles Quint* (Paris, 1876); Capefigue, *François Ier et la renaissance* (Paris, 1844). In English a popular account will be found in Pardoe, *The Court and Reign of Francis I.* (London, 1849, and later editions); Cochrane, *Francis I. and Other Historic Studies* (London, 1870); Coignet, *Francis I. and His Times*, translated by Twemlow (London, 1889).

FRANCIS II. (1544-60). King of France from 1559 to 1600. He was the eldest son of Henry II. and Catharine de' Medici, and ascended the throne in his sixteenth year. Weak in mind and body, he was merely a tool in the hands of the Duke of Guise and the Cardinal of Lorraine, whose ambition brought on the disastrous civil wars. But for his marriage (1558) with Mary Stuart, a niece of the powerful Guises, Francis II. would now scarcely be remembered. Consult De la Barre-Duparcq, *Histoire de François II.* (Paris, 1867).

FRANCIS I. (1777-1830). King of the Two Sicilies from 1825 to 1830. He was the son of Ferdinand I. and became heir to the throne in 1778. In 1812 he was appointed Regent of Sicily by his father, and proclaimed a constitutional government, but in the following year his father deposed him, and dissolved the Parliament. In 1816 Francis became Governor of Sicily, and in 1820 Regent of Naples. In 1825, on the death of his father, he ascended the throne. The character of liberal ruler which he had previously assumed immediately disappeared; and his reign was marked by corruption, cruelty, and subserviency to Austria. Consult Nisco, *Napoli sotto Francesco I.* (Naples, 1887).

FRANCIS II. (1836-94). King of the Two Sicilies from 1859 to 1861. He was the son of Ferdinand II., and followed his father's system in ruling with an iron hand. In keeping with his rigorous policy of absolutism, he refused all liberal concessions in spite of the urgent demands of the powers. When all Sicily, with the exception of Messina, had submitted to Garibaldi, in the summer of 1860, he sought to pacify his people by the promise of manifold reforms, and failing to secure their good will, made strong but unsuccessful efforts to secure foreign intervention in his behalf. After Garibaldi's entrance into Naples September, 1860, the King fled to Capua, and thence to the citadel at Gaeta. After a short siege, Gaeta surrendered, and the King took refuge on a French frigate February 13, 1861. His dominions were incorporated in the Kingdom of

Italy, and he selected Rome as his place of residence. Consult Nisco, *Francesco II., re.* (Naples, 1891). See GARIBALDI; ITALY.

FRANCIS JOSEPH I. (1830—). Emperor of Austria. He was born August 18, 1830, at Vienna, the eldest son of Archduke Francis and a nephew of Ferdinand I., Emperor from 1835 to 1848. Francis was taught the various languages of the heterogeneous Austrian monarchy. In 1848 he served under Radetzky in Italy. On December 2, 1848, amid the convulsions which threatened the dissolution of the Empire, the weak Emperor Ferdinand abdicated, his brother, the Archduke Francis, gave up his claims to the crown, and Francis Joseph, whose youth and popularity it was believed would make it easier to harmonize the conflicting interests of the monarchy, mounted the Austrian throne. Hungary was now in a state of open revolt, and in April, 1849, declared itself a republic with Kossuth as Governor. In Italy Charles Albert of Sardinia again took up arms against Austria. Both in Hungary and Italy Austria triumphed, and the Emperor devoted himself to the reestablishment of his authority. (See AUSTRIA-HUNGARY.) In 1853 an attempt on his life was made by an Hungarian, but the Emperor escaped with a slight wound. In 1855 a concordat was concluded with Pius IX., which restored to the Roman Catholic Church throughout the Empire many of the liberties of which it had been deprived since the hostile reign of the Emperor Joseph II. In 1859 Francis Joseph was called to face a war with France and Sardinia, which ended with the loss of Lombardy. After this war Francis Joseph abandoned his conservative policy, and began the necessary work of reform, and after the disastrous Seven Weeks' War (q.v.) with Prussia, a reconstruction of the monarchy on a dualistic basis was effected by the *Ausgleich* of 1867. The abrogation in 1870 of the concordat of 1855 antagonized the Pope. Francis Joseph has since striven to maintain a constitutional and parliamentary régime in his dominions. He enjoys the respect and affection of his subjects, and it is his personal influence that really holds his dominions together under the most discouraging political conditions. During his reign the Austro-Hungarian monarchy has experienced a great industrial development. Francis Joseph married, April 24, 1854, Elizabeth, daughter of Duke Maximilian of Bavaria, who was assassinated by an Italian anarchist in Geneva September 10, 1898. The Emperor's only son, Rudolph, died a violent death in January, 1889. The present heir presumptive is the nephew of Francis Joseph, Francis Ferdinand. See AUSTRIA-HUNGARY.

FRANCIS, CONVERS (1795-1863). An American Unitarian clergyman and writer. He was born at West Cambridge, Mass., graduated at Harvard, and became a Unitarian minister at Watertown. Lydia Maria Child, the philanthropist, was his sister. Dr. Francis was made professor of pulpit eloquence in Harvard University. He wrote a *Life of Rev. John Eliot, the Apostle to the Indians* (1836), for Sparks's "Library of American Biography," and a *Life of Sebastian Rale* (1848), the Jesuit missionary, as well as memoirs of other celebrated men. Consult Newell, "Memoirs of Convers Francis," in *Massachusetts Historical Society's Proceedings* (Boston, 1864-65).

FRANCIS, JAMES BICHENO (1815-92). An American hydraulic engineer. He was born at Southleigh, England, and came to America at the age of sixteen. From 1837 to 1884 he was chief engineer of locks and canals on the Merrimac River, and in this connection his numerous investigations and experiments in hydraulic engineering have attracted wide attention. His scientific papers have been published chiefly in *Lowell Hydraulic Experiments*, (3d ed. 1883), and he also wrote *The Strength of Cast-iron Columns* (1865).

FRANCIS, JOHN WAKEFIELD (1789-1861). An American physician of German and Swiss descent, born in New York. He was graduated from Columbia College in 1809, and received the degree of M.D. from the College of Physicians and Surgeons, New York City, in 1811. He was professor of obstetrics and of medical jurisprudence in Rutgers Medical College, New York City, from 1826 to 1830; professor of materia medica in the College of Physicians and Surgeons from 1813 to 1816; professor of the institutes of medicine from 1816 to 1820; and professor of obstetrics from 1820 to 1826. He was one of the most active members of the New York Historical Society, and used his influence to promote the study of natural history and the fine arts. He interested himself greatly in the Woman's Hospital, the State Inebriate Asylum, and kindred institutions. With Dr. David Hosack he published the *American Medical and Philosophical Register* (1810-14). Among his many works were: *Use of Mercury* (1811); *Cases of Morbid Anatomy* (1814); *Febrile Contagion* (1816); *On Cholera Asphyxia* (1832); *Anatomy of Drunkenness* (1857); *Memoir of Christopher Colles*; and *Old New York, or Reminiscences of the Past Sixty Years*.

FRANCIS, SIR PHILIP (1740-1818). An English epistolary writer, the reputed author of the *Letters of Junius*. The son of Rev. Philip Francis, he was born in Dublin, and was educated at Saint Paul's School, London, where he had for a school-fellow Henry S. Woodfall, afterwards editor and printer of the *Public Advertiser* and publisher of the *Letters of Junius*. In 1756 he obtained a place in the office of Henry Fox, then Secretary of State. In 1758 he became secretary to General Bligh, whom he accompanied on the expedition against Cherbourg; in 1760 secretary to the Earl of Linnoul, Ambassador to Portugal; in 1761 amanuensis to Pitt; and in 1762 first clerk in the War Office. In 1773 he was appointed a member of the Council of Bengal, with a salary of £10,000, and sailed for India the next year. He quarreled with Warren Hastings, by whom he was severely wounded in a duel. Returning to England in 1781, he entered Parliament three years later, and took an active part in the impeachment of Hastings. He never gained a reputation as an orator, but his great abilities and extensive information always commanded the respect and attention of the House. In his political opinions he was a decided and consistent Whig. He withdrew from Parliament in 1807. None of his acknowledged writings, consisting mostly of political pamphlets, are of permanent value. There is considerable evidence to prove that he was the author of the *Letters of Junius* (q.v.). Consult Parkes and Merivale, *Memoirs of Sir Philip Francis* (London, 1867).

FRANCIS/CA. A nun in the convent of which Isabella is a novice in Shakespeare's *Measure for Measure*.

FRANCISCANS, ORDER OF (also called Minors or Lesser Brethren), a religious Order of the Catholic Church, founded by Saint Francis of Assisi in 1209. For an account of the establishment of the Order and its earliest years, see **FRANCIS OF ASSISI, SAINT**. The rule drawn up by Saint Francis in 1209 was divided into twenty-three chapters, containing twenty-seven precepts, which were afterwards rendered obligatory by the Popes under pain of mortal sin. The use of money is absolutely forbidden, and the quantity, quality, and value of the clothing are prescribed. The habit was to consist of a gray gown of coarse cloth, with a pointed head or capuche, an under-tunic and drawers, and a cord around the waist. This costume resembled the dress of the shepherds of the day. The use of shoes and riding on horseback were prohibited. Conversations with women and the visiting of female monasteries were forbidden. Fasts on all Fridays of the year were enjoined, as also during the periods from All-Saints to Christmas and from Epiphany to Easter. The recitation of the Divine Office was also rendered obligatory. Absolute obedience to superiors in all things not contrary to the rule was prescribed. The Order grew rapidly and spread throughout the various countries of Europe, until at the second general chapter, held at Assisi in 1219, within ten years of its birth, more than five thousand brethren were present. In less than half a century it reckoned some 33 provinces, in which there were over 8000 convents, with a membership of 200,000. Some idea of the extraordinary extension of this remarkable institute may be formed from the startling fact that, in the dreadful plague of the black death in the following century, no fewer than 124,000 Franciscans fell victims to their zeal for the care of the sick and for the spiritual ministration of the dying. After the death of Saint Francis a modification of the rule was introduced by Brother Elias, his successor in the office of general of the Order. This innovation related to the interpretation of the nature and extent of the vow of religious poverty, whether the community could acquire the privilege of the right of property even in things of necessary use. Those who adhered to the letter of the rule denied the privilege of all right of property to the community, and contended that it was unlawful for the Order to acquire or retain a right of property in houses, convents, or even churches, restricting its right in everything which it possessed to the simple use. Out of this controversy arose divisions and subdivisions in the Order. The first broad distinction to which it gave rise was that between the Conventuals and the Observantines, the former living according to a mitigated interpretation of the rule and holding to the community's right of property, while they strictly adhered to the vow of poverty on the part of the individual; the Observantines, following the more rigid interpretation of the rule, deny the right of property in the Order and live more in the manner of hermits, in low, mean dwellings, and according to the original rigor of the institute. The latter are called Friars Minor of the Strict Observance. In the course of time there arose among the Observantines themselves sev-

eral reform movements, which gave rise to three branches; that of Saint Bernardino of Siena in 1419, called the Reformed; then that of Blessed John de la Puebla, and Blessed John of Guadalupe, under the name of Recollets in 1500; and finally the reform of Saint Peter of Alcantara in 1555, known under the name of Alcantarines. But all three branches are subject to the one minister-general at Rome, and all are discalced or barefooted friars. Several popes attempted to reconcile the differences between the Conventuals and the Observantines without avail. Finally, in 1517, Leo X. officially recognized the distinction between them, and in a bull promulgated that year gave the name of Conventuals to those who persisted in following the mitigated rule and in holding to the community's right of property. Each body had its own general, but the minister-general of the Observantines enjoyed preëminence and authority over the general of the Conventuals, who was obliged to obtain his confirmation from the former. During the Pontificate of Sixtus V. the Conventuals sought in vain to free their head from this subordination, and renewed the attempt in 1594 under Clement VIII. with no greater success. When they renewed their claim again under Urban VIII. the latter imposed silence upon them by a brief of April 21, 1631.

The entire Franciscan body consists of three main groups, respectively called the first, second, and third Orders. To the first Order belong the male members of the different observances, who bind themselves by solemn vows; the second Order consists of the female religious, the Poor Clares, Urbanists, and Capuchin nuns; the tertiaries, or third Order, comprise both lay persons and certain religious congregations affiliated to the Order of Franciscans. (See **TERTIARY**.) An immense number of persons desirous of practicing in the world the virtues of the cloister joined the third Order, from the humblest to the highest station in life; notably among the latter in the thirteenth century were Saint Louis of France and Saint Elizabeth of Hungary. In the course of time some tertiaries desirous of living in community, while conforming to the rules of the third Order, formed communities in many parts of Europe which were affiliated with the general body as a branch distinct from the first and second Orders.

The head of the entire Franciscan body is chosen alternately from the Cismontane and the Ultramontane families, a geographical division, the latter being those religious whose convents are situated in France, Spain, Lower Germany, Saxony, the islands of the Mediterranean, Africa, Asia, and the Indies in general; the former those in Italy, Upper Germany, Hungary, Poland, Syria, and Palestine. Each family is again divided into provinces, vicariates, or custodies. Several custodies constitute a province under a common superior appointed by the general. Some custodies are subject to a provincial, while others depend immediately upon the general. The superior of the entire Order bears the title of Minister-General of the Order of Saint Francis, and to his jurisdiction the Poor Clares and the Urbanist nuns are also subject. The general of the Conventuals is called Master-General of the Friars Minor Conventuals; the general of the Capuchins, an offshoot of the Franciscans, founded by Matteo di Bassi in 1526, is called Minister-

General of the Friars Minor Capuchins. The third Order has also a general of its own. The Order has given five Popes to the Church: Nicholas IV., Alexander V., Sixtus II., Sixtus V., and Clement XIV., besides fifty-four cardinals, beginning with Saint Bonaventure. It has given some celebrated theologians and philosophers to the ranks of the schoolmen; Saint Bonaventure, Duns Scotus, Alexander of Hales, William of Occam. Roger Bacon, famous as the experimental philosopher of the Middle Ages, was a Franciscan friar. The great Spanish statesman Cardinal Ximenes, two centuries later was also a follower of Saint Francis. Its historian, Father Luke Wadding, who published his elaborate *Annals* of the Order in the seventeenth century, bears a deservedly high reputation. In lighter literature, and especially poetry, Saint Francis himself is notable as a sacred poet. Jacopone da Todi, the author of the "Stabat Mater," is one of the most celebrated mediæval hymn-writers; Lope de Vega, the Spanish dramatist, closed his eventful career as a member of the third Order. Dante, it is believed from a passage in the *Divina Commedia*, was a Franciscan tertiary. In the revival of art the Franciscan Order bore an active and enlightened part. They may be said to have been the inspiring influence which gave rise in painting to the mystical School of Umbria, which in Perugino and Raphael attained the ultimate reach of Christian art. Giotto and his successors, especially in fresco painting, were profoundly influenced by the Franciscan spirit. In architecture the same spirit was potent in creating new types of churches in line with Cistercian models. The Franciscans may be said to have imported into art a sentiment which, before them, had existed only in a crude state—seraphic love. Their idealism and religious fervor did more perhaps than any other factor to exalt and spiritualize the art of the Middle Ages up to the time of the Renaissance.

FRANCIS DE SALES, *Fr. pron. frän'sis'* de säll, SAINT (1567-1622). A distinguished saint and writer of the Catholic Church. He was of noble descent, and was born at the Château de Sales, the seat of his family in Savoy. He was the eldest son, and his father bestowed unusual care upon his education with the idea of fitting him for a worldly career in keeping with his station in life.

After spending his earlier years at the Collège de la Roche and the College of Annecy, in the neighborhood of his home, he became a pupil, at thirteen years of age, of the Collège Clermont at Paris under the direction of the Jesuit Fathers. In 1584 he entered the University of Padua, where, at twenty-four, he took his final degree with great distinction and became a Doctor of Laws. But his inclination was for the Church rather than for law. His father at first opposed his wish to enter the priesthood, but in the end gave his consent. Upon his ordination he was appointed provost of the diocesan chapter at the request of Monseigneur de Granier, Bishop of Geneva. In 1594 the young priest was sent to the difficult mission of the Chablais, a province of Savoy, which had become Calvinistic. His efforts for a long time proved fruitless; but in time he saw his labors repaid with numerous conversions, before his departure witnessing the restitution of all churches and of all ecclesiastical property in the Chablais to the diocesan clergy. Shortly after his return from the apostolate of the Chablais, at the solicitation of Monseigneur de Granier, Francis was made coadjutor bishop with the right of succession to the See of Geneva; and his succession followed in 1602. In that year the interests of the French division of the Geneva diocese took Francis to Paris. Here Henry IV. conceived a cordial liking for him. As Bishop of Geneva Francis was as indefatigable in his apostolic labors as when he was a simple priest. His preaching was simple, fervid, and direct. He carefully avoided the turgid ornament and rhetorical affectations common to the sermons of his century. As a writer Saint Francis de Sales has attained a wide popularity. His *Introduction to the Devout Life* has been translated into almost every language of Europe, and has been more widely read than any other work on devotion with the exception of the *Imitation of Christ*. His *Treatise on the Love of God* is his chief doctrinal work, and shows more fully the comprehensive character of his mind. His style is simple, lucid, and profusely illustrated. It was under the spiritual direction of Saint Francis de Sales that Sainte Jeanne de Chantal (see CHANTAL, JEANNE FRANÇOISE DE) founded the Congregation of the Visitation of the Virgin Mary in 1610. Saint Francis died at Lyons, on September 28, 1622. In 1665 he was solemnly canonized by Pope Alexander VII., and in 1877 he was declared one of the Doctors of the Church. His complete works were published in Paris, 1861-62. The *Love of God* has been edited by Strowsky (Paris, 1901; Eng. trans., London, 1902). For his life, consult: C. A. de Sales (Chambéry, 1860); Camus (London, 1880); Lear (London, 1882); also Guillot, *François de Sales et les protestants* (Geneva, 1873).

FRANCIS OF ASSISI, *frän'sé-zé*, SAINT (1182-1226). The founder of the Order of the Friars Minor, or Franciscans. He was born in the little town of Assisi, Italy. His father was a rich merchant by the name of Pietro Bernardone; his mother, Pica, of the noble family of the Bourlemonts of Provence, a woman of piety and character. The child's baptismal name was Giovanni (John); but his father, out of his predilection for France, with which he carried on an exten-

sive trade, gave the boy the surname of Francisco (the Frenchman), which history has consecrated. Francis was taken into business partnership at the age of fourteen by his father. In his twenty-fourth year, after much meditation and pondering on the course of life he had been leading, he suddenly abandoned his old friends and haunts, and embraced a life of rigid penance and utter poverty. His object was to lead a life as nearly modeled upon that of Christ as possible, and by absolute renunciation of the world to attain evangelical perfection. Retiring to a grotto near Assisi, he gave himself up to penance and profound meditation on the sufferings of Christ. His austerities and his simple eloquence attracted attention, and it was not long before others, awakened by his ardent example, sought to follow in his steps and join themselves to him in his austere mode of life. His first companions were fellow townsmen, Bernard of Quintavalle, a rich and noble layman, and Peter of Catana, a canon of the cathedral. Here was the nucleus of the Franciscan Order. It was not the intention of Saint Francis in the beginning to found a new Order. But others associating themselves with the three companions, until there were twelve all told in the band, and asking for a rule of life, Saint Francis drew up a rule in twenty-three chapters, which, besides the three ordinary vows, of poverty, obedience, and chastity, prescribed the express and absolute renunciation of every possession and the engagement to live upon alms. As soon as the rule was drawn up (probably toward the close of June, or early in July, 1209), all betook themselves to Rome to seek the approval of the Pope. Innocent III., then Pope, after some hesitation, approved the rule by word of mouth, made Francis superior-general of the Friars Minor, and conferred the diaconate on the founder, for Francis was as yet only a layman, and always, from motives of humility, refused to become a priest. On their return to Assisi the Friars Minor established themselves in a little house adjoining the Chapel of Saint Mary of the Angels. During the following two years the brethren occupied themselves with preaching and exhorting the people throughout the rural district around Assisi. The Order now grew rapidly, and in 1216 was solemnly approved by Innocent III. Francis now sent missionary bands into the different provinces of Italy; then into France, Spain, and even Africa, to preach to the Moors. He himself set the example of the missionary work of the Order by going into the East. Two years before his death Saint Francis, while in an ecstasy of prayer, is said to have received the marks (stigmata) of the wounds of Jesus upon his own person. (See STIGMATIZATION.) The scene of this event is laid on Monte Alverno, a lonely mountain near Assisi, and the date September 14, 1224. Saint Francis died at Assisi, October 3, 1226. He was canonized by Pope Gregory IX., in 1228.

The works of Saint Francis have been frequently printed, by Horoy (Paris, 1880), in Latin; better by B. da Fivizzano (Florence, 1880), Latin with Italian translation. Consult the biographies written by Paul Sabatier (Paris, 1894; Eng. trans. by Houghton, New York, 1894); Prudeniano (Naples, 1896); Knox-Little (London, 1897); Oesterly (London, 1901); and

Christen (Innsbruck, 1902). François d'Assise et la légende de ses trois compagnons* (Paris, 1901); Carmichael, *The Lady of Poverty: A Thirteenth Century Allegory* (New York, 1902).

FRANCIS OF PAOLA, pou'la, SAINT (1416-1507). Founder of the Order of Minimites. He was born in Calabria. At an early age he gave himself to a hermit's life, following the example of Saint Francis of Assisi, having no bed but bare rocks, and no other food than the herbs which he gathered in the neighboring woods, or which were brought to him by his friends. He was joined by some other enthusiasts, and the building of a chapel in 1436 is generally considered as marking the beginning of the Minimize Order. (See MINIMITES.) In 1474 the Order was definitely confirmed by the Pope, and Francis appointed its first superior. During the following years several new convents were founded in Calabria and Sicily, and the fame of Francis for sanctity and miraculous powers increased daily. When Louis XI. of France was alarmed by the approach of death, he sent to beg the intercession of Francis, who was unwilling to go to France until he was commanded by Sixtus IV. He visited the King at Plessis-les-Tours and prepared him for death, holding him in his arms when it came. Louis's son, Charles VIII., also had a great respect for him, and built him a cloister in the park of Plessis and another at Amboise. He completed his rule in 1493, in three parts, for the brothers, sisters, and tertiaryaries. He died at the Convent of Plessis in 1507, and was canonized by Leo X. in 1519.

FRANCIS XAVIER, SAINT (1506-52). A celebrated Jesuit missionary, called, from the scene of his mission labors, 'the Apostle of the Indies.' He was the youngest son of one of the most distinguished families of Navarre, and was born near Pamplona, in that kingdom, April 7, 1506. His early education was received at home, and in 1524 he was sent to the College of Saint Barbe, in Paris, where he pursued studies in philosophy with so much distinction that at the age of twenty-four he became a lecturer in philosophy in the Collège Beauvais, at that time one of the most important in the university. He attracted the attention of Ignatius Loyola, then an obscure student at the university, but already taken with the prospect of founding the Society of Jesus. Ignatius, on the lookout for suitable associates, became a close friend of Xavier's. The young professor's mind was intent on university distinction; but, realizing the vanity of his ambitions, he became one of the first members of the Order that his Spanish compatriot was about to found. During Xavier's work in Rome, John III. of Portugal, anxious to extend the influence of Christianity to his immense Indian possessions, made a formal demand of the Pope for missionaries, and asked especially for members of the new Order. Ignatius selected Bobadilla; but illness prevented his setting out, so Xavier was substituted for him, and after a single day for prepa-

ration began his journey to Lisbon. At Lisbon, during the preparations for the voyage, he accomplished so much good that the King wanted to retain him at his capital. But Xavier's heart was now bound up in the mission to India, and he sailed from Lisbon, April 7, 1541. He wintered at Mozambique, and did not arrive in Goa until May 6, 1542.

He found the lives of the European Christians in India so scandalous that it was useless to preach to the natives with such a perverse example under their eyes. Accordingly, he first took up the reformation of the foreign townspeople, and succeeded in awakening a spirit of exemplary penance and religious fervor. Then he began his labors among the natives by preaching among the pearl-fishing population of the coast from Comorin to the island of Manar. After a little more than a year he returned to Goa, whence, with a fresh staff of assistants, he visited the Kingdom of Travancore. In the space of a single month here he baptized ten thousand natives. Thence he passed to Malacca, where three other Jesuit missionaries, sent by Ignatius in compliance with Xavier's earnest solicitations, joined him. His success among the dwellers on the coast region proved so encouraging that in 1546 he proceeded to the Banda Islands, to Amboyna, and the Moluccas. Having effected an establishment of the Gospel in many places, he now retraced his steps and revisited the scenes of his missionary labors. His care in the selection and instruction of native catechists was proved by the excellent state of the missions. He had a supreme faculty for organization; hence he succeeded not only in making large numbers of converts, but in forming them into communities with inherent vitality.

After this he crossed to the island of Ceylon, where he converted the King of Kandy, with many of his people. In May, 1548, he returned to Goa, to prepare for the conversion of the Japanese Empire. A distinguished Japanese convert became a valuable auxiliary, and by his aid Xavier was enabled to acquire enough of the Japanese language to translate and explain the Apostles' Creed in it. His first success was insignificant, but before long the usual blessing attended his labors. The mission founded by him at Miako continued to flourish for more than a hundred years, until the final expulsion of Christianity from the Japanese Empire. After two years and a half in Japan, he resolved to organize a mission to China. At Malacca he tried to arrange with the Governor that an embassy should be sent in the name of the King of Portugal to China, by the help of which he hoped to gain an entrance for his mission. He was not able to effect this, however. Accordingly, he took passage in a merchant ship to the island of Sancian, near Macao, which was at that time the trading port of the Chinese with merchants from Portugal. Here, having obtained a Chinese interpreter, he hoped to induce some native merchants to land him secretly on the coast. His plan was baffled by the fears of the Portuguese, who dreaded that the Chinese authorities would punish this infraction of the law.

Xavier's disappointment was keen. For years his heroic zeal had tempted him to labors beyond his strength, and his sublime charity had exposed him to privations which had undermined

his constitution. He fell ill of fever, for which his attendants could find no means of relief. On the very threshold of what he looked forward to as the greatest opportunity of his missionary life, the saint passed away, on the island of Sancian, according to his latest biographer, November 27, 1552, though the date December 2d has always been given hitherto. Many miracles performed by him at all stages of his career as a Jesuit are attested by numerous witnesses. Xavier was beatified by Pope Paul V., in 1619, and canonized by Pope Gregory XV., in 1622. His feast day was fixed upon December 3d. His only literary remains are a catechism, some short ascetic treatises, and a collection of letters. Of the letters there are translations in most of the modern languages.

Consult: Coleridge, *Life and Letters of Saint Francis Xavier* (London, 1873); Cros, *Saint François de Xavier, sa vie, son pays, sa famille* (Toulouse, 1900-01); *Monumenta Xaveriana* (Madrid, 1899-1900).

FRANCK, fränk, ADOLPHE (1809-93). A French philosopher, born at Liocourt, Meurthe, of Jewish parents. He was professor of philosophy in various French schools, and occupied the same position at the Collège Charlemagne in Paris in 1840. He held the chair of Greek and Latin philosophy at the Collège de France from 1849 to 1852, and from 1854 to 1881 lectured there on natural law and the law of nations. He was one of the editors of the *Journal des Débats*, and the founder of *La Paix Sociale*, the organ of the league against atheism. Among his works are: *Dictionnaire des sciences philosophiques* (1843-56), of which he edited the greater part; *Le communisme jugé par l'histoire* (1849); *Philosophie et religion* (1867); and *La religion et la science dans le judaïsme* (1883).

FRANCK, CÉSAR AUGUSTE JEAN GUILLAUME HUBERT (1822-90). A French composer, born at Liège. After studying at the conservatory there he went to Paris, where he attended the Conservatory, studying under the organist Benoist and others. He settled in Paris, and in 1872, at the Conservatory, succeeded Benoist, who retired after fifty years of service. Meanwhile Franck had composed much, but found little recognition, though it is interesting, as indicating Liszt's breadth of judgment, that in the fifties chamber-music by Franck was played in Liszt's private concerts at Weimar. In 1846 Franck's oratorio *Ruth* was brought out at the Conservatory, but without success. Yet twenty-five years later it was revived at the Circe d'été, and the following year at the Conservatory, with such brilliant results that a 'Franck cult' was instituted among the younger French musicians. Franck's music, however, though admirable technically, lacks melodic spontaneity. While France at one time neglected his talent, the present tendency there is to overrate it. In the United States his best-known works are his oratorio *Les béatitudes*; chamber music; songs; and his *Variations symphoniques*, for piano and orchestra. He died in Paris.

FRANCK, fränk, MELCHIOR (c.1580-1639). A German composer, born at Zittau. He lived in Augsburg, where his first works were published in 1601. The following year he went to Nuremberg, and in 1603 became chapel-master at Coburg. His best work is in sacred music, and

some of his chorals are still sung. He is one of the most prolific and interesting of the old German composers.

FRANCK, SEBASTIAN (1499-1543). A German reformer and humorist, born at Donauwörth. Ordained to the Roman priesthood in 1524, he joined the Reformation shortly afterwards; married in 1528, and, after some minor didactic works, published at Strassburg in 1531 his *Chronika*, one of the first German attempts at universal history. He led a wandering and precarious life as a soap-boiler, author, and printer, and in 1539 settled at Basel, where he died. He appears to have been a pantheistic mystic, a forerunner of modern German idealism, of wide social sympathies and broad tolerance. His style is vigorous and clear—far superior to that of his time. His collection of *Sprichwörter* (1541) is edited by Guttenstein (1831). For his life, consult: Weinkauff, in *Birlinger's Alemannia* (Bonn, 1877), and Haggelmacher (Zurich, 1886).

FRANCKE, FRÄNK'É, AUGUST HERMANN (1663-1727). A distinguished German educator and philanthropist, founder of the Francke Institute (*Stiftungen*) at Halle. He was born at Lübeck. In the early years of his manhood his interests were primarily theological. His orthodoxy was called into question, however, partly because of the envy caused by his extraordinary popularity as a preacher, and he was therefore unable to hold his position as lecturer at Leipzig. While still a young man, his attention had been drawn to the unsatisfactory state of the German educational methods, and when, in 1695, he was called to assume the duties of pastor in a small town near Halle, he started a private school in his own house. The school grew rapidly, and Francke found it necessary to rent a building to accommodate it. In connection with it he founded a school for the children of well-to-do parents, and in 1697 he added a Latin school and a school for girls. Arrangements were made to care for orphans, and poor scholars received their meals free of charge. A corps of able teachers gathered around him; new buildings were erected; a bookseller's shop and other forms of business were undertaken to help to defray expenses. Francke's theological enemies sought to injure his thriving educational institute: but in 1713 the King of Prussia, Frederick William I., visited it and promised Francke his support. From that time the institute grew unchecked, until at Francke's death the Pedagogium, or school for the children of the wealthy, had 40 students, the Latin school 400, the common schools 1725. One hundred and seventy-five teachers were employed, all of whom were students at the University of Halle. They received their board, and afterwards their lodging, for their services. A seminary for teachers was established as early as 1707, which aimed to train young men in the methods of teaching. Thus the institute became the foremost training school of the time for teachers. The extraordinary success of Francke's Institute led to the establishment of similar institutions in other German cities, and the influence of Francke and his disciples materially affected the character of the Prussian system of public education, which was established by Frederick William I. and remains unchanged in its essential features at the present day.

Francke published a number of pamphlets on religious and pedagogical subjects; but these are of minor importance as compared with his institutional work. Consult: Kramer, *Franckes pädagogische Schriften* (Langensalza, 1885); id., *August Hermann Francke, ein Lebensbild* (Halle, 1880-82); Stein, "August Hermann Francke," in *Deutschen Geschichts- und Lebensbildern* (Halle, 1894).

FRANCKE, KUNO (1855—). A German-American scholar and author, born at Kiel. He was educated at the University of Munich, and was appointed professor of German literature at Harvard University, Cambridge, Mass. His publications include: *Zur Geschichte der Schulpoesie des zwölften Jahrhunderts* (1878); *De Hymno in Cererem Homericum* (1880); *Libelli de Lite Imperatorum et Pontificum* (1892); *Social Forces in German Literature* (1896); *Glimpses of Modern German Culture* (1898); and a *History of German Literature* (1901).

FRANCKE, WILHELM (1803-73). A German jurist. He was born at Lüneburg, and was educated at the Collegium Carolinum, Brunswick, and at Göttingen, where he was appointed professor of Roman law in 1828. In 1831 he was called in the same capacity to Jena, where he also held the position of counselor of the Court of Appeals. During the last thirty years of his life he was associated with the University of Göttingen. He stood in high repute as an authority on and teacher of Roman law, was co-editor of the *Archiv für die civilistische Praxis* (1837-73), and wrote *Das Recht der Noterben und Pflichtteilsberechtigten* (1831).

FRANCKEN, FRÄNK'ÉN. A family of painters of Antwerp, eleven in number, living in the sixteenth and seventeenth centuries. A similarity of Christian names leads to much confusion in classifying their works. When Frans the first found a competitor in Frans the second, he took the name of 'the elder,' the second being 'the younger.' But when the third Frans became a rival of the second, the latter took the name of 'the elder,' and Frans the third became 'the younger.' The eldest of the Frankens, NICHOLAES OF HERENTHALS, died in 1596. None of his works is known. HIERONYMUS (1540-1610), his eldest son, was occupied chiefly in Paris, where he was engaged in decorating the Palace of Fontainebleau, where some of his paintings remain. Others are to be found in the Dresden Museum, the Amsterdam Museum, and the Brunswick Gallery. The second son of Nicholaes was FRANS FRANKEN 'the first' (1542-1616). He studied under Floris and was dean of the Guild of Saint Luke in 1588-89. His paintings were mostly religious subjects, and are especially numerous at Brunswick and Dresden. AMBROSIUS (1544-1618), third son of Nicholaes, left more works than both his brothers. Most of them are religious subjects to be found at Antwerp, in the Church of Saint Jacques and the Museum. Among the best of them are the "Miracle of the Loaves and Fishes," and the "Martyrdom of Saint Crispin," in the Antwerp Museum. His productions are exaggerated in all respects, but he possesses greater invention than the rest. Frans 'the first' trained his sons to the profession. The third of these sons is FRANS FRANKEN (1581-1642) 'the second,' who also signed himself 'the younger.' When his son Frans grew up he also signed him-

self 'the elder.' He studied in Italy, but was also influenced by Rubens. Among his chief works are the "Works of Mercy," in the Antwerp Gallery; "Solon and Croesus," in the Brussels Gallery; "Christ Washing the Apostles' Feet," in the Berlin Museum. Nearly all European galleries possess his pictures. FRANS FRANCKEN 'the third' (1607-67) painted in the manner of Rubens. He painted religious subjects, of which there are good examples in Antwerp and Augsburg, and interiors of churches, as may be seen at Dresden and The Hague.

FRANCKENSTEIN, fränk'en-stin, GEORG ARBOGAST, Baron (1825-90). A German legislator. He was born at Würzburg, and was educated at Munich. As an Ultramontane member of the Bavarian Diet, he was opposed to the participation of Bavaria in the Franco-German War, and voted against the measure providing for the entrance of the kingdom into the German Empire. In the German Reichstag he became the leader of the Centrist Party. The principal measure introduced by him was the so-called 'Franckenstein Clause,' later incorporated as paragraph 7 of the tariff laws (July 9, 1879). He was first vice-president of the Reichstag from 1879 to 1887.

FRANCO, fränk'kò, GIOVANNI BATTISTA (1510-61). An Italian painter and engraver named Semolei. He was born at Udine, went to Rome as a young man, and there was much impressed with the work of Michelangelo. When Charles V. entered the city (1536), Franco painted the triumphal arch with scenes from Roman history. Afterwards he went to Florence and painted in company with Vasari. His drawing is better than his color. By order of the dukes Alexander and Cosimo de' Medici, he executed many portraits and pictures, and for the Duke of Urbino some work in falconry. As an engraver, Franco stands higher than as a painter. He left about a hundred etchings. The best of his works are: "Moses Striking the Rock," "Manna in the Desert," "The Adoration of the Shepherds," and "Simon the Magician." They are rather dryly finished, and have little freedom.

FRANCO-GERMAN WAR OF 1870-71. The immediate cause of this struggle was France's jealousy of the growing importance of Prussia, which power Bismarck was determined to place at the head of a united Germany, and the desire of Napoleon III. to strengthen his tottering throne by a successful war against the hereditary foe of the French nation. The actual occasion for the outbreak of hostilities was furnished by complications growing out of the political situation in Spain. On June 25, 1870, Isabella II. of Spain, who had been deposed in 1868, formally abdicated the throne. On July 5th the foreign governments were notified of her abdication, and on the same day the fact was made public that Prince Leopold of Hohenzollern had consented to become a candidate for the vacant throne of Spain. This consent was said to have the approval of the King of Prussia. The news caused intense excitement in Paris, and the Foreign Minister, the Duc de Gramont, caused representations to be made to the Prussian Government of the displeasure with which the French Government regarded the candidacy of Prince Leopold. On July 12th the announcement of the withdrawal of Prince Leopold's candidature was made.

On the following day the French Ambassador, Benedetti (q.v.), unceremoniously addressing William I. at Ems, insisted that the King should make a declaration to the effect that no Hohenzollern prince would ever be permitted to accept the Spanish crown. The King declined to listen to this demand, and broke off the interview. He sent Bismarck a copy of the French demand, with authority to make use of it. This Bismarck did, giving to the press such parts of the communication as would tend to arouse the German people. It does not appear that in so doing he misrepresented the attitude of France. Taking notice of this publication as if it had been official, the French Government, deeming itself called upon to take immediate steps for the defense of the national honor, formally declared war against Prussia, July 19, 1870.

While the popular enthusiasm in the two countries in favor of war was about equal, there proved to be a vast difference as to the state of the military preparations. The French Government supposed that from 450,000 to 500,000 men were available for instant mobilization; but the army was ill organized, imperfectly equipped, and not properly provided with depots. But 250,000 men were ready for the first movements in August, 1870, and there was no reliable reserve. The French force was in one body, practically known as the Army of the Rhine. Against this the North German Confederation was able to put into the field an army of about 450,000 men with a reserve of nearly 400,000. The French hoped that the South German States, out of jealousy of Prussia, would refuse to join her, but these joined forces at once with their countrymen, put their troops under Prussian command, and thus added to the overwhelming weight that was thrown upon France. The action of Prussia was promptness itself. King William arrived in Berlin July 15th, meeting Bismarck, Moltke, and Roon, and orders for mobilization were at once given. Three armies were formed. The first, under General von Steinmetz, was placed near Trèves, forming the right wing; the second, under Prince Frederick Charles, was sent to Rhenish Palatinate; the third, under the Crown Prince of Prussia, took its position on the frontier of Baden. The French forces were scattered over a line of about 100 miles in length. The First Corps, under Marshal MacMahon, was placed near Strassburg; the Fifth Corps, under Faily, along the frontier of the Palatinate; the Third Corps, under Marshal Bazaine, near Metz; the Second Corps, under Frossard, not far from the Prussian frontier, near Saint Avold; the Fourth Corps, under Ladmirault, near Thionville; the reserve forces, under Bourbaki and Marshal Canrobert, were partly at Nancy and partly at the camp of Châlons; the Seventh Corps, under General Félix Douay, held the fortress of Belfort. These were the positions of the two contending armies toward the end of July, 1870. On the 23d of that month Napoleon appointed the Empress Regent of France, and on the 28th left Paris with the Prince Imperial to take command of the army at Metz. The King of Prussia left Berlin to take his place in the field July 31st, accompanied by General von Moltke, as chief of staff, and Count Bismarck, and on August 2d established his headquarters at Mainz. On the same day a portion of Frossard's corps made an attack on the Prussian position at

Saarbrück, in the presence of the Emperor and his son. After protracted firing the Germans retreated, and the French occupied Saarbrück. The results of this engagement were unimportant.

The first serious conflict of the war took place August 4th, at Weissenburg, where the German advance guard was attacked by the French under Gen. Abel Douay; it ended after a battle of five hours, in the French troops retiring in great disorder, with heavy loss. General Douay was killed. The Germans had now 520,000 men and 1170 guns ready for fighting orders, while the entire force of the French (with reserves) amounted to only 350,000 men. On August 6th at Würth, the Crown Prince attacked MacMahon, who had been strengthened by divisions of the corps of Faily and Canrobert. The French suffered a terrible defeat, and lost 8000 in dead and wounded, and 6000 prisoners. The German loss was over 10,000 officers and men. On the same day a bloody battle was fought at Spichern, near Saarbrück, also known as the battle of Forbach, between General Steinmetz and General Frossard. The Germans stormed the heights of Spichern, and the French force was thrown back in disorder on Forbach and Metz. The Germans lost 4648 men in killed and wounded, while the French loss amounted to about 2000 men killed and 2000 prisoners. Thus both wings of the French army were completely defeated; the original position could no longer be held, and all the French corps gathered into two large masses to retreat along the line of the Moselle. Two separate armies were now formed—the one known as the Army of Metz, commanded by Marshal Bazaine, and the other commanded by Marshal MacMahon. By August 14th the first German army had advanced to the immediate neighborhood of Metz, and by a successful attack upon the French Third Corps under Bazaine baffled the first attempt of that commander to retreat to the line of the Marne. This developed into the sanguinary battle of Colombey-Nouilly, or of Courcelles. The Prussians lost nearly 5000 men in killed and wounded; the French loss was about 3500. The battle prevented the junction of Bazaine's army with that of MacMahon at Châlons. In the battle of Mars-la-Tour, or Vionville, fought on August 16th, the army of Bazaine was repulsed by Prince Frederick Charles, and driven back on Gravelotte with immense loss to both sides—about 16,000. On the 18th occurred the great battle of Gravelotte (q.v.), in which 200,000 Germans fought against 130,000 Frenchmen. Bazaine's army, occupying a very strong position to the west of Metz, was, after nine hours' fighting, completely defeated, cut off from its communication with Paris, and driven back toward Metz. The losses were very heavy. The French lost about 600 officers and 13,000 men; the Germans, about 900 officers and 20,000 men.

Bazaine was now shut up in the fortifications of Metz, which was invested by Prince Frederick Charles. A fourth army was organized, and placed under command of the Crown Prince of Saxony, to move rapidly upon Paris. MacMahon, marching to the relief of Metz, was cut off by the third and fourth German armies, which were converging on Paris, and on the first of September was fought the battle of Sedan, the Waterloo of the Second Empire. The forces of MacMahon were caught in an unfavorable position, where they could be attacked from all sides, and were driven

upon the fortress of Sedan, where, surrounded and defeated, the entire army surrendered (September 2d), with the Emperor, who was carried prisoner to Wilhelmshöhe. By this capitulation, 83,000 men, including 40 generals, 230 officers of the staff, and 2595 officers, became prisoners of war, in addition to 21,000 men who had been made prisoners during the battle. Meanwhile, on August 31st, Bazaine made a sortie from Metz, attempting, during that day and the following, to break through toward the north, but was driven back into the fortress.

When the news of the capitulation of Sedan and of the capture of Napoleon reached Paris it caused an upheaval. On September 4th the Third Republic was proclaimed, and a Government of National Defense was formed, of which the chief members were Jules Favre, Crémieux, Ferry, Jules Simon, and Gambetta. General Trochu, the military Governor of Paris, was its head. Gradually the Germans closed in on Paris, no serious resistance in the field being attempted. By September 19th the capital was regularly invested. The investing force was far inferior to that of the besieged in numbers, but the French forces in Paris were largely a half-trained provisional levy, brimming with disaffection and the spirit of revolution, which afterwards broke out in the Commune. Strassburg surrendered on September 28th. A few days later Gambetta escaped from Paris in a balloon and issued a proclamation from Tours calling for a levy *en masse*. On October 11th General Von der Tann, after defeating a French force, entered Orleans. On October 27th Bazaine surrendered at Metz with his army of about 175,000 men to Prince Frederick Charles. A gleam of hope was infused into the French by a momentary victory of General Aurelle de Palladines, commander of the Army of the Loire, who on November 9th beat back Von der Tann at Coulmiers, near Orleans, the French reëntering Orleans on the following day. On November 28th, however, Aurelle de Palladines was repulsed at Beaune-la-Rolande, and was again defeated before Orleans on December 2-4. Nor were the other armies put into the field by the appeals of Gambetta more successful in coming to the relief of Paris, where General Ducrot made a desperate attempt to break through the German lines at Brie and Champigny, November 30-December 3. The army of General Chanzy engaged that of the Grand Duke of Mecklenburg on the Loire, December 7-10, but was forced to retreat from this scene of operations, and on January 10-12, 1871, he was completely overthrown by Prince Frederick Charles at Le Mans. In the north, where the Germans had reached and entered Rouen as early as December 6th, the army of General Faidherbe suffered a defeat at Pont Noyelles, December 23d, and another at Bapaume, January 3d, and on January 19th it was overwhelmed by General Von Goeben at Saint Quentin. In the east, General Bourbaki made a diversion at the close of December which was at first successful, but he was repulsed by General Von Werder before Belfort on January 15-17. On December 27th the Germans opened a bombardment on Mont Averon, one of the forts of Paris, and two days later they obtained possession of the fort. After an unsuccessful sortie from Mont Valerien, led by General Trochu, January 19th, Paris, which had reached the point of starvation, capitulated January 28, 1871, a par-

tial armistice having been arranged between Bismarck and Jules Favre. Four days later the remains of Bourbaki's army retired into Switzerland. In the meanwhile, during the progress of the siege of Paris, the work of consolidating Germany into an empire had been consummated by the proclamation at Versailles, on January 18th, of William I. as German Emperor. The armistice gave France an opportunity to form a responsible government that could conduct peace negotiations. On February 8th elections were held for a National Assembly, which met at Bordeaux, February 12th, and which, on February 17th, elected Thiers Chief of the Executive. On February 16th the capitulation of Belfort closed the military operations. The Germans occupied all the forts around Paris. France was helpless, with nearly all her trained soldiers disarmed or prisoners of war, while French territory was occupied by a German army of more than half a million men. The new Government of France now undertook the task of securing peace.

The indefatigable labors of Thiers resulted, on February 26th, in the arrangement of preliminary terms of peace with Germany, which were formally accepted by the National Assembly, March 1st, by a vote of 546 to 107. The terms of this treaty were as follows: (1) The cession by France of the German-speaking part of Lorraine, including Metz and Thionville, and of Alsace, excepting Belfort; (2) France to pay five milliards of francs as war indemnity—one milliard in 1871, and the balance in installments extending over three years; (3) the evacuation of French territory to begin upon the ratification of the treaty, Paris and some western departments to be evacuated at that time, the troops in other departments to be withdrawn gradually as the indemnity was paid; (4) the German troops to be maintained at the cost of France, and not to levy upon the departments occupied by them; (5) inhabitants of the annexed territories to be allowed to choose between the two nationalities; (6) prisoners of war to be immediately set at liberty; (7) negotiations for a definitive treaty of peace to be opened at Brussels after the ratification of this treaty; (8) the administration of the departments occupied by the German troops to be intrusted to French officials under the control of the chiefs of the German corps of occupation. The definitive treaty of peace was signed at Frankfurt, May 10, 1871. The two great results of the war were the establishment of the Third Republic in France and the consolidation of Germany into an empire.

An official history is *Der deutsch-französische Krieg, 1870-71*, by the German General Staff (Berlin, 1874-81), translated into English (London, 1874-84). Chuquet, *La guerre de 1870-71* (Paris, 1895), is called by Seignobos the "handiest and most reliable history of the whole war." The diplomatic history of the war is treated in Valfrey, *Histoire du traité de Francfort* (Paris, 1874-75), and Sohél, *Histoire diplomatique de la guerre franco-allemande* (Paris, 1875). Washburne, *Recollections of a Minister to France* (New York, 1887), are valuable memoirs by the American Minister, who filled a difficult post with tact and discretion.

See articles on the various battles mentioned in this text.

FRANÇOIS, FRÄN'SWÄ', JEAN CHARLES (1717-69). A French engraver, born at Nancy. He was the inventor of engraving in imitation of crayons (1740). This obtained for him the position of engraver to the King, and he received a pension. His works include plates after Van Loo, Holbein, Boucher, and others. His work is of mediocre quality.

FRANÇOIS, KUET VON (1853—). A German cartographer and explorer of Africa. He was born at Luxemburg, and after completing his military education at Wahlstatt and Berlin, served in the German Army during the war of 1870-71, in which his father, General François, met his death at the battle of Spichern. He was a member of Wissmann's African expedition in 1883, and two years later was the companion of that famous soldier and explorer, on the expedition in which two tributaries of the Congo were explored. On a tour undertaken in 1887 he penetrated from the coast at Togo northward to about the twelfth parallel, north latitude, and two years later, in recognition of his distinguished services, was appointed commander of the military contingent in German Southwest Africa. As acting Imperial Commissioner, to which position he was appointed in 1891, he explored as far as Lake Ngami. His vigorous warfare against the native chieftain, Henrik Witboi, an inveterate enemy of German domination, resulted in the total rout of the Hottentots. Prevented from following up his victory by reason of disagreements among his officers, and foreseeing the impossibility of a complete subjugation of the enemy under the circumstances, he resigned his commission in 1895. In 1901 he settled in German Southwest Africa. His principal works include: *Im Innern Afrikas*; *Die Erforschung des Kassai*, in collaboration with Wissmann (2d ed. 1891); and *Die Erforschung des Tschuapa und Lulongo* (1888).

FRANÇOIS, LUISE VON (1817-93). A German author. She was born at Herzberg, Province of Saxony, and after the death of her father lived for several years at Weissenfels, Minden, and Halberstadt, but chiefly at the house of her uncle, General Karl von François, at Potsdam. Her works embrace mainly novels, and entertaining stories, several of which have become very popular. Among them are: *Die letzte Reckenburgerin*, a novel (6th ed. 1895); *Frau Erdmuthens Zwillingssöhne* (2d ed. 1891); *Stufenjahre eines Glücklichen* (1877); and *Der Katzenjunker* (1879).

FRANÇOIS DE NEUFCHÂTEAU, de nê'shâ'tô', NICOLAS LOUIS FRANÇOIS, Count (1750-1828). A French statesman and poet. His first volume of verse was published in 1766. Encouraged by Voltaire, he obtained the chair of rhetoric at Toul in 1770. In 1792 he was Deputy to the National Assembly, of which he became secretary and finally president. In 1793 he was imprisoned for the publication of a comedy, *Paméla, ou la vertu récompensée*. In 1797 he became Minister of the Interior under the Directory, and in 1804-06 he was president of the Senate. After the Restoration he retired from politics. His works include *Fables et contes en vers* (1814), *Les trois nuits d'un gouteux* (1819), and many miscellaneous articles and translations.

FRAN'COLIN (Fr., Sp. *francolin*, Port. *francolin*; probably diminutive of Port. *frango*, *frango*, chicken). A bird of the genus *Francolinus*, of the family Tetraonidae, closely allied to partridges. They are natives of Asia and Africa. One species only (*Francolinus vulgaris*) was formerly found in the most southern parts of Europe, but is now extinct there, though still common in various parts of Asia and in Cyprus. Most of the thirty species of francolin known are found in Africa, and all are objects of sport, and good for food.

FRANCONIA (ML., from OHG. *Franchun*, Franks). The name of a mediæval duchy in Germany, embracing the country on both sides of the Main, from the Rhine to the mountains of Bohemia. The region was conquered by Clovis, and later was dependent upon Austrasia (q.v.). After the Treaty of Verdun (843) it was part of the German kingdom. In 911 Conrad of Franconia was raised to the royal throne, and a century later the choice of the German princes again fell upon the Franconian House, which, by its direct and collateral branches, gave kings and emperors to Germany from 1024, when Conrad II., the Salic, began his reign, till 1125, when Henry V. died, and again from 1138, when Conrad III. ascended the throne, till 1254, when Conrad IV., the last Hohenstaufen Emperor, died. In 1022 Franconia was divided into Franconia Occidentalis and Franconia Orientalis (West and East Franconia). The former, in 1155, passed to Conrad, son of Frederick Barbarossa (q.v.), who was given the title of Count Palatine of the Rhine. During its connection with the Crown, Franconia increased in extent and importance, while its great spiritual principalities of Mainz, Speier, Worms, Bamberg, and Würzburg acquired both wealth and political influence. After 1155 the name Franconia was usually given only to the eastern portions of the ancient duchy. In 1512 Maximilian I. established the circle of Franconia, without, however, including in it the Palatinate. With the dissolution of the Holy Roman Empire in 1806, the name of Franconia disappeared from among the political divisions of Germany, but since 1837 it has been revived in the Kingdom of Bavaria (q.v.), where those portions of the ancient Franconian region which had been known as the circles of the Upper Main, Rezat, and Lower Main are now designated Upper, Middle, and Lower Franconia.

UPPER FRANCONIA includes the northeast portion of Bavaria. It is watered by the Main, Saale, and other streams. Its surface rises in the Fichtelgebirge to a height of 3500 feet. Farther west are the mountains of the Franconian Forest, which are considerably lower. The valleys produce good crops and fruit, and the district is rich in minerals. Population, in 1900, 607,903. The capital is Bayreuth.

MIDDLE FRANCONIA, which borders on Württemberg, is intersected by branches of the Franconian Jura, but has few rivers of importance besides the Regnitz and Altmühl, which are connected by the great Ludwigskanal. It produces good wine, but is principally celebrated for its hop-gardens. Population, in 1900, 815,556. The capital is Anspach. Nuremberg is the principal town.

LOWER FRANCONIA, which occupies the northwest part of Bavaria, is the richest and best cul-

tivated of the Franconian districts, and is celebrated for the excellence of its wines. The district is noted for its mineral springs at Kissingen, Brückenau, and Wipfeld. Population, in 1900, 650,758. The capital is Würzburg.

FRANCONIA MOUNTAINS. See **WHITE MOUNTAINS**.

FRANCS-TIREURS, frän'té-rér' (Fr., free-shooters). The name given to bands of French soldiers that sprang into existence during the Franco-German War of 1870-71. They had their origin in the military societies formed in north-eastern France as early as 1867. They did not form a part of the regular army until November, 1870, and at first their military organization was very imperfect. They waged irregular warfare by attacking small detachments of the enemy and baggage trains as well as single travelers. At first they were not recognized by the Germans as having any military standing at all, and when seized were shot or hanged; but after a time, when they received a better organization, and coöperated with the regular French Army, such recognition was accorded them. They carried on an irregular warfare long after the main French armies had been wiped out. See **GUERRILLAS**.

FRANCUCCI, frän-kö'chê, INNOCENZO. See **IMOLA**, INNOCENZA DA.

FRANEKER, frän'e-kër. A town of the Netherlands, in the Province of Friesland, situated on the canal between Harlingen and Leeuwarden (Map: Netherlands, D 1). It was formerly the seat of a university founded in 1585 by the Frisian States and abolished by Napoleon. Franecker has a church dating from the fifteenth century, a town hall (restored) built in 1591, and a curious astronomical model, showing the motions of the planets, built in 1774-81 by a citizen named Eise Eisinga. Population, in 1890, 7143; in 1900, 7114.

FRANGIPANI, frän'jé-pü'nê (named after the Marquis Frangipani, major-general under Louis XIV.). A scent or perfume, either derived from or manufactured in imitation of a flower produced by a West Indian tree of the genus *Plumiera*, called the red jasmine. .

FRANGIPANI. An illustrious and powerful Roman house, which began with Leo Frangipani in 1014 and attained the summit of its power in the eleventh and twelfth centuries. The residences and strongholds of the Frangipani were near the Arch of Titus and the Coliseum. The rivalry of the Frangipani with the house of the Pierleoni not only occasioned repeated civil wars in the State, but likewise troubles in the Church. In the early part of the twelfth century the two families controlled the college of cardinals. The Frangipani were partisans of the Emperor, the Pierleoni usually opponents. After the death of Frederick II., however, the family interest was enlisted in the Papal cause. Giovanni Frangipani captured Conradin of Hohenstaufen, and delivered him, in 1268, to Charles of Anjou. The origin of the name Frangipani is attributed to the family's benevolent distribution of bread in time of famine. Consult Gregorovius, *Rome in the Middle Ages* (trans., London, 1895-1900).

FRANGIPANI was also the name of a noble family of Croatia, whose members distinguished themselves in the wars against the Turks. The

most celebrated of the line were John Frangipani, who about 1390 was made Ban of Croatia, Slavonia, and Dalmatia, and Christopher Frangipani, who fought at Mohács (1526). Francis Christopher Frangipani about 1670 entered into a conspiracy against the Emperor Leopold I., having for its ultimate object the restriction of Germanic influences in Hungary, and the reassertion of the Magyar power. The conspiracy was discovered and Frangipani was executed in 1671.

FRANK, FRÜHK, ALBERT BERNHARD (1839-1900). A German botanist. He was born in Dresden, and was educated at Leipzig. From 1881 until his death he was professor of vegetable physiology at the Agricultural College at Berlin. His works consist chiefly of valuable text-books, and include: *Die Krankheiten der Pflanzen* (1880); *Lehrbuch der Pflanzenphysiologie mit besonderer Berücksichtigung der Kulturpflanzen* (1890); *Pflanzenbuch für niedere und mittlere Landwirtschaftsschulen* (1894); *Kampfbuch gegen die Schädlinge unserer Feldfrüchte* (1897); and with Krüger, *Schildlausbuch* (1900).

FRANK, FRANZ HERMANN REINHOLD VON (1827-94). A German theologian, born at Altenburg, and educated at Leipzig. He was professor of theology at Erlangen from 1857 until his death, was co-founder of the *Neuen Kirchlichen Zeitschrift*, and wrote a large number of works, most of which have been several times republished. These include: *System der christlichen Gewissheit* (2d ed. 1885-86); *System der christlichen Wahrheit* (2d ed. 1885-86); *System der christlichen Sittlichkeit* (1884-87); *Zur Theologie A. Ritschels* (3d ed. 1891).

FRANK, GUSTAV WILHELM (1832-1904). A German theologian, born in Schleiz. He was educated at Jena, and held a professorship at that university from 1864 to 1867, when he was appointed professor of dogmatics and ethics at the University of Vienna. He published an edition of Apelt's *Religionsphilosophie* (1860), and is the author of *Geschichte der protestantischen Theologie* (1862-75); and *Die evangelisch-theologische Fakultät in Wien von ihrer Gründung bis zur Gegenwart* (1871).

FRANK, JACOB (1712-91). A pseudo-Messiah of the Jews and founder of a sect called Frankists after himself, or Zoharites after their sacred book. His real name was Jakob Lebowicz, and he was the son of a rabbi of southern Galicia. When a young man, traveling in the East, the Turks called Jakob a Frank, their common appellation for a European, and this surname he always retained. After his return to Poland he settled in Podolia and gathered around him many rabbis and persons skilled in the science of the Cabala. He represented himself to be the second Messiah and had many followers. In 1756 he was arrested and imprisoned for a time, but was released and soon after, with many of his followers, professed Christianity. He quickly, however, resumed his earlier Messianic pretensions, made large collections of money from his adherents in Poland and Bohemia, and went to Brünn in Moravia, where he lived luxuriously on the offerings of his followers. In 1786 he removed to Offenbach, where he displayed even greater magnificence, declaring himself to be the Messiah, and regarded as immortal by his ad-

herents, until he was stricken down with apoplexy December 10, 1791. The sect still exists in Poland, numbering among its members persons in Poland, Rumania, and Turkey. Consult Graetz, *Frank und die Frankisten* (Breslau, 1868).

FRANK, JOHANN PETER (1745-1821). A German physician. He was born at Rothalben, Bavaria, and studied medicine at Heidelberg and Strassburg. In 1785 he accepted a call to Pavia, where he remained until his appointment to the directorship of the General Hospital at Vienna (1795). With this institution he was associated until 1804, during which time he also delivered lectures at the university. After a short term as professor of medicine at Vilna, Russia, he was appointed physician in ordinary to Czar Alexander I., returning to Vienna in 1808. His influence upon the development of medical practice in Lombardy, Austria, and Russia was extraordinary. He devoted himself chiefly to the improvement of public sanitation, of which he has been called the founder, and several of the works written by him on this subject have served as a basis for the further development of sanitary legislation. His principal works include: *System einer vollständigen medizinischen Polizei* (6 vols., 1779-1819, supplement, 3 vols., 1812-27; translated into Italian, 1808-30); *De Curandis Hominum Morbis Epitome* (6 vols., 1792-1821; German trans., 3d ed. 1840-41); *System der landwirthschaftlichen Polizei* (1789-91); and *Selbstbiographie* (1802).

FRANK'ALMOIGNE (Lat. *libera elemosyna*, free alms). A form of feudal tenure, whereby lands were held by religious houses or persons for charitable purposes. By the ancient common law of England, a man could not alien lands which came to him by descent without consent of his heir, but he might give a part to God in free alms. It was an old Saxon tenure, and continued under the Norman revolution, through the great respect that was shown to religion and religious men. This is the tenure by which almost all the ancient monasteries and religious houses held their lands, and by which the parochial clergy and very many ecclesiastical foundations held them at this day. The statute of 12 Car. II., c. 24, which abolished the old tenures, specially reserved tenure in frankalmoigne. The condition on which lands in frankalmoigne were held was, that masses and divine services should be said for the grantor and his heirs, but no particular service was specified. At the Reformation, the nature of the services was changed, but the tenure was suffered to continue. A tenant in frankalmoigne did no fealty to his overlord, and in the event of failure to perform the service the latter was not entitled to distrain, but might complain to the ordinary or visitor. In this respect this tenure differed from tenure by divine service, i.e. where lands were given on condition of performing a specified service, as saying a mass on a particular day, or distributing certain alms. In this case the tenant was bound to render fealty, and the lord was entitled to distrain on failure to perform the service. By the Anglo-Saxon law lands held in frankalmoigne were subject to the *trinoda necessitas*, or repairing highways, building castles, and repelling invasions. In Scotland lands conveyed to the Church in *puram elemosynam* were said to be

mortified. See FEE; FEUDALISM; TENURE. Compare MORTMAIN.

FRÄNKEL, fränk'el, BERNHARD (1836—). A German physician. He was born at Elberfeld, and was educated at Würzburg and Berlin, where in 1884 he was appointed professor. In recognition of his valuable investigations on diseases of the throat and nose, he was, in 1887, made director of the clinical institute of the university especially devoted to the treatment of those diseases. In addition to the treatise entitled "Allgemeine Diagnostik und Therapie der Krankheiten der Nase," in Ziemssen's *Handbuch der speziellen Pathologie und Therapie*, vol. iv. (1879), he wrote "Skrofulose und Tuberkulose," in Gerhard's *Handbuch der Kinderkrankheiten*, vol. iii. (1878); and *Der Kehlkopfkrebs* (1889).

FRÄNKEL, WILHELM (1841-95). A German engineer. He was born at Odessa, Russia, and was educated at the Polytechnic Institute at Dresden, where he was appointed professor in 1865. His devices for gauging the carrying capacity of iron bridges have been widely adopted. His articles on bridge and railroad construction include "Bewegliche Brücken," in the *Handbuch der Ingenieur-Wissenschaften* (2d ed. 1888).

FRANKENBERG, fränk'en-bèrk. A flourishing manufacturing and trading town of Saxony, Germany, 32 miles southwest of Dresden, and near Chemnitz (Map: Germany, E 3). It has manufactures of cottons, woolens, silk stuffs, cigars, Venetian blinds, and the largest calico-printing works in Saxony. There are a number of picturesque castles and churches in the vicinity, and an iron cross, dedicated to the poet Körner, is to be seen in a spot made famous by one of his ballads. Population, in 1890, 11,400; in 1900, 12,728.

FRANKENHAUSEN, fränk'en-hou'zen. A town of the Principality of Schwarzburg-Rudolstadt, Germany, on the Wipper, 27 miles north-northwest of Weimar (Map: Germany, D 3). There are productive salt springs here, and the manufacture of cigars, sugar, and articles in mother-of-pearl is carried on. The salt baths are much frequented. In the neighborhood are mines of lignite, and the Barbarossa cavern, discovered in 1865. Population, in 1890, 5944; in 1900, 6383. Frankenhause figures in history as the scene of a battle between the rebellious peasants under Thomas Münzer, May 15, 1525, and the Saxon, Brunswick, and Hessian troops, in which the peasants were defeated.

FRANKENSTEIN, fränk'en-stin, OR, THE MODERN PROMETHEUS. A novel by Mrs. Shelley, begun in 1816, and published anonymously at London in 1818. An American edition appeared at Philadelphia in the same year, and another at Boston in 1869. The title character of the tale is a student who finds the secret of creating life artificially. His first creation is a horrible yet pathetic monster, who murders his friend and pursues Frankenstein himself from one land to another, complaining of his loneliness and begging his unfortunate maker to create a mate for him.

FRANKENTHAL, fränk'en-täl. A flourishing industrial town of Germany, situated in the northeastern part of the Bavarian Palatinate,

about 10 miles northwest of Mannheim and near the Rhine (Map: Germany, C 4). Its only particular object of interest is the portal of the Abbey Church, founded in 1119. The industrial establishments of Frankenthal include machine-shops, iron-foundries, and sugar-refineries. Frankenthal is named as early as the eighth century. Population, in 1895, 14,445; in 1900, 16,849.

FRANKFORT, or **FRANKFORT-ON-THE-MAIN** (Ger. *Frankfurt am Main*, pron. fränk'föört äm mIn). A city of Prussia, in the Province of Hesse-Nassau, government district of Wiesbaden, situated on the right bank of the navigable Main (Map: Prussia, C 3). It lies in a fertile and picturesque plain surrounded by mountains, and embraces the important suburb of Sachsenhausen on the left bank, connected with the main city by several stone or iron bridges. Frankfort still has many old and narrow streets with high-gabled projecting houses; but its ancient walls and ramparts have been converted into promenades, and there are now wide handsome streets and broad quays in the modernized sections. The gates of the famous Judengasse, which were closed at night to prevent the egress of the Jewish inhabitants, were razed at the time of the French occupation in 1806. Gradually all the interesting old houses in this street, now called Börnestrasse, have been torn down, except the family house of the Rothschilds, one of the attractions for sightseers. In the heart of the ancient town is the Römerberg, or market-place, with the Justitia Fountain in its centre. It was the scene of popular rejoicings after the election of an Emperor. Hebrews were formerly not allowed to enter this square. The main artery of the new town is the Zeil, continued by the Kaiserstrasse. The most prominent squares are the Rossmarkt with the Gutenberg Monument, the Goetheplatz with Schwanthaler's statue of Goethe, the Schillerplatz with the statue of Schiller, the Kaiserplatz with an attractive fountain, the Börsenplatz, and the Opernplatz. Among the spacious streets leading to the outer quarters of the city the Bockenheimer Landstrasse is the most noteworthy.

The ancient Cathedral of Saint Bartholomew ranks first among Frankfort's ecclesiastical structures. Founded about 870, it was built after Gothic patterns at different periods between 1235 and 1415. The election, and from 1562 the coronation, of the German emperors took place here. The Wahlkapelle (election chapel) dates from 1355. Of the other churches, there may be mentioned the Church of Saint Leonhard, erected in 1219-1507; the Nikolaikirche, a graceful edifice of the thirteenth century; the Katharinenkirche, built in 1680, containing fine monuments and paintings; and the new Church of Saint Peter. The Paulskirche, erected in 1787-1833, is memorable as having been the seat of the German National Parliament of 1848-49. The most prominent among the ancient secular buildings is the Römer, which is in reality a group of twelve separate mediæval houses, reconstructed and enlarged at various times. Here in the Kaisersaal, or Imperial Hall, the newly elected Emperor held his public banquet. The hall is embellished with good modern portraits of all the German emperors. Other interesting old structures are the Leinwandhaus, or Draper's Hall, now the Municipal Historical Museum, containing a valuable collection of antiquities and some paintings,

and among whose documents the Golden Bull is preserved (see HISTORY below); the Gothic Haus Fürsteneck; the Steinerne Haus of 1464; the Haus zum grossen Engel of 1562, half Gothic and half Renaissance; the Tuchgaden, where the guild of butchers was wont to celebrate the coronation of the emperors; the Goldene Wage, with an ornate façade; and the Haus zum Rebstock with its picturesque court. More famous is the Goethe house, in which the poet was born and spent his boyhood. The house is now to be seen as it was in Goethe's youth, the restorations and refurnishings being due to the Deutsche Hochstift. The adjoining Goethe Museum contains portraits, autographs, letters, etc., and also the Goethe Library—a specialized collection of the works of the best German period.

Among the modern public buildings are the City Library, having a fine Corinthian portico; the Municipal Record Office; the new Exchange with a handsome hall and rich façade; the beautiful opera house, accommodating 1900 spectators; the law courts and the post-office, and the magnificent Central Railway station, opened in 1887, unsurpassed by any structure of its kind on the Continent. In Sachsenhausen is situated the splendid Stüdel Art Institute, in the Italian Renaissance style, with a fine portal and a dome. Its notable picture gallery is especially rich in specimens of the Dutch and the early Flemish masters, and of the older Düsseldorf School. Hals, Brouwer, Teniers the Younger, Van der Weyden, and Van der Velde are well represented; and Van Eyck and Moretto merit particular attention. Among the moderns, Overbeck, Veit, Lessing, Böcklin, and Lenbach are also to be seen to advantage. The gallery comprises, in addition, some interesting sculptures, and one of the best collections of engravings in Germany (numbering 60,000 examples), and a school of art for students of painting, sculpture, and architecture. The environs and the public grounds which surround Frankfort, on the site of the ancient fortifications, are very attractive. The Taunus promenade is especially noteworthy. Among the statues and monuments not already mentioned are those of William I., Börne, and Charlemagne (on the picturesque mediæval Old Bridge across the Main), and Schopenhauer, who lived in Frankfort from 1831 to 1860.

The important commercial standing of Frankfort is due chiefly to its financial strength, although its industries developed considerably during the last quarter of the nineteenth century. The manufactures include chemicals (principally printer's ink), gold and silver wire, machinery, carpets, drugs, tobacco, and electric supplies. The city is the seat of many of the most important industrial and mercantile associations of southern Germany, as well as the home of some of the strongest moneyed institutions in the world, the banks of Frankfort having been famous since the days of the early Rothschilds. Commercially it was well known as early as the sixteenth century, when its semi-annual fairs attracted merchants from every direction. With the establishment of the German Customs Union and the development of Continental railway systems, its advantages have considerably diminished in importance. The supremacy in the book-publishing trade, which Frankfort enjoyed for many generations, was long ago gained by Leipzig. The

city is one of the most important railway centres of Europe; and its shipping, due to the recent canalization of the Main and important improvements of the river harbor, has considerably increased. In 1900 the arrivals and departures of ships were over 10,000.

The government is administered by a chief burgomaster, an assistant burgomaster, 24 magistrates, 3 assessors, and a council of 64 members. The municipality operates its own water-works and gas plant, but has leased its street railways to a private company. The water-supply is excellent, the city having of late expended 30,000,000 marks (\$7,140,000) on this service. The superior sanitary conditions have reduced the death-rate to a low figure. Frankfort's municipal debt in 1900 was about \$23,000,000, of which more than one-half stood for property representing value of more than twice this particular indebtedness. For schools there is annually expended about \$1,000,000; for charities, \$200,000; for the street-cleaning service, \$170,000; for police, \$58,000. The educational institutions include three gymnasia, a number of Real-schulen, twenty-five public schools, an industrial art school, several music schools, a teachers' seminary, and several homes for imbecile and physically deformed children. The Museum of Art and Industry has an interesting collection of furniture, china, bronzes, panelings, etc. The municipal library contains about 262,000 volumes, 414,000 manuscripts, a collection of coins, and Marchese's marble statue of Goethe. There are also not a few smaller public libraries, with reading-rooms, several learned societies, art leagues, and botanical and zoological gardens, besides the many museums. The three important theatres receive subsidies from the city. The hospitals and other charitable institutions are numerous and creditable examples of their kind.

The figures for the population of Frankfort have more than doubled since 1880, partly because the outlying districts have been absorbed. The inhabitants then numbered 136,819, as against 40,000 in 1800. By 1890 the total had reached 179,985, and in 1900, 288,989. About 60 per cent. of the population is Protestant.

HISTORY. Although Frankfort does not appear in history until 793, it is probable that at a very early period some settlement occupied the present site of the city, which was then the meeting-place of a number of Roman military roads running from Mainz east. In 794 Charles the Great held a church council at Franconovurd (see FRANKFORT, COUNCIL OF), and mention is made at the same time of a palace there, which Charles's son, Louis the Pious, greatly enlarged in 822 and made his residence. After the partition of Charles's empire, Frankfort became the capital of the East Frankish Kingdom, and as such it frequently appears in the documents of the time in connection with many important diets and ecclesiastical assemblies. Its political importance declined after the extinction of the Carolingian dynasty, but it still remained an important centre of trade. After 1152 the kings of the Romans were chosen at Frankfort; and this custom was formally sanctioned by the Golden Bull of 1356, which made it the *Wahlstadt*, or Electoral City of Germany. In 1245 Frankfort attained the rank of a free Imperial city, and from that time until about the middle of the

fourteenth century it steadily acquired greater powers of self-government, including an independent mint. Frankfort adopted Protestantism about 1530, and in 1536 it joined the Schmalkaldic League (q.v.). After the middle of the sixteenth century the German emperors were crowned here. The town suffered severely from pestilence during the Thirty Years' War. Like many another city of Germany, it was ruled for hundreds of years by a merchant oligarchy, which bitterly resisted all attempts on the part of the guilds to secure a share in the government. In 1612 a popular insurrection under the leadership of one Fettmilch broke out against the misgovernment of the patrician families. The lower classes improved the opportunity to vent their spite upon the Jews, who from an early period constituted an important element of the population. The Jews were forced to flee from the city, and for four years the popular leaders were in power. Order, however, was restored in 1616 by the intervention of the Emperor. The Jews were restored, and the only result of the insurrection was to strengthen the ruling oligarchy. In the revolutionary wars, Frankfort was occupied by the French in 1792, in 1796, and again in 1806. In 1806 it ceased to be a free Imperial city, and was given by Napoleon to Dalberg, the Primate of the Confederation of the Rhine. In 1810 Napoleon created for Dalberg the Grand Duchy of Frankfort, having an area of about 2000 square miles. This disappeared with the downfall of Napoleon, and Frankfort regained its rank (along with Hamburg, Bremen, and Lübeck) as a free city at the Congress of Vienna, and in 1816 became the capital of the German Confederation. During the revolutionary period of 1848 it was the very centre of German nationality and the battleground of the opposing tendencies of the time. The Vorparlament (q.v.) met there on March 31, 1848, and from May 18, 1848, to May 30, 1849, it was the seat of the National Assembly convened to bring about the reconstitution of Germany. The period after 1850 was marked by the abandonment of the old oligarchic constitution and the enactment of liberal legislation. Freedom of labor was then completely established for the first time, and the Jews were emancipated. In the war of 1866 Frankfort embraced the cause of Austria. The city was occupied by the Prussians on July 16th, and on October 18th it was incorporated with Prussia. On May 10, 1871, the definite treaty of peace, marking the end of the Franco-German War, was signed at Frankfort. Consult: Battonn, *Oertliche Beschreibung von Frankfort* (Frankfort, 1861-75); Bleicher, *Statistische Beschreibung der Stadt Frankfort am Main und ihrer Bevölkerung* (2 parts, ib., 1892, 1895); Wolff and Jung, *Die Baudenkmäler in Frankfort* (ib., 1895); Horne, *Geschichte von Frankfort* (ib., 1893); Stricker, *Neuere Geschichte von Frankfort seit 1806* (ib., 1874-81); Mentzel, *Frankfort am Main, ein Städtebild* (ib., 1898).

FRANKFORT. A city and the county-seat of Clinton County, Ind., 45 miles northwest of Indianapolis; on the Lake Erie and Western, the Vandalia Line, the Louisville, New Albany and Chicago, and the Toledo, Saint Louis and Kansas City railroads (Map: Indiana, C 2). It has a public library, and a fine court-house and high-school building. The city is in a productive agricultural district, has a supply of natural gas,

and manufactures brick and tile, lumber, flour, brick-making machinery, agricultural implements, crackers, etc. There are also large wholesale grocery establishments. The electric-light plant is owned by the municipality. Population, in 1890, 5919; in 1900, 7100.

FRANKFORT. A city, the capital of Kentucky, and the county-seat of Franklin County, 55 miles east of Louisville; on both sides of the Kentucky River, which is spanned by a suspension bridge 700 feet long, and on the Louisville and Nashville and the Chesapeake and Ohio railroads (Map: Kentucky, G 2). The city is situated amid picturesque scenery, in the heart of the 'Blue Grass' region of the State. On one of the hills near by is the Franklin Cemetery, which ranks with the most beautiful in the South, and in which are buried Daniel Boone and other persons prominent in the history of the State. There are monuments to the soldiers who died in the wars of 1812 and with Mexico. Among the prominent buildings are the State House, the Governor's Mansion, the State Arsenal, the State Penitentiary, the State Home for Feeble-Minded Children, and the State Colored Normal School. The State Library has over 100,000 volumes. The river is navigable, and, by means of a lock and a dam, furnishes abundant water-power. Frankfort carries on a very considerable trade, and has extensive manufactures of lumber, whisky, flour, chairs, shoes, twine, carriages, etc. The government, under a charter of 1893, is vested in a mayor, elected every four years, and a municipal council, which elects most of the administrative officials not chosen by popular vote. Population, in 1890, 7892; in 1900, 9487.

Frankfort was founded in 1786, by Gen. James Wilkinson, who made it the centre of his commercial operations, and, for a time, of his Spanish intrigues. In 1792 it became the capital of the State, though five years later it had a population of only 441, of whom 112 were slaves. In the fall of 1862, during the Civil War, Frankfort was occupied by the Confederate General Braxton Bragg (q.v.), and in the presence of the Confederate Army and a large crowd of citizens, Richard Harves, the chosen representative of the Confederate faction of the State, was, on October 4th, formally inaugurated Governor. The approach of General Buell forced Bragg to evacuate on the same day. In 1900 William Goebel, Democratic Governor-elect, was assassinated here, and Frankfort was the centre of considerable excitement during the prolonged controversy over the Governorship.

FRANKFORT, COUNCIL OF. An assembly convened at Frankfort-on-the-Main by Charles the Great in 794, and attended by all the bishops and many ecclesiastics of the Frankish kingdom, Italy, Aquitania, and even by some ecclesiastics from England. Its principal business related to: (1) The doctrine of Adoptianism (see *ADOPTIAN CONTROVERSY*), as recently revamped by Elipandus and Felix; and (2) the question of image-worship. Adoptianism was condemned, and also the rendering of Latria (the worship due to God alone) to images, under the mistaken idea that the second Council of Nicæa had sanctioned it. The canons of the Council have the customary range, and touch upon many matters. Two of them of more than curious interest are (1) the thirty-third: "The Catholic belief in the Holy Trinity, the

Lord's Prayer, and the Apostles' Creed should be preached and taught to every one"; and (2) the fifty-second: "Let no one fancy that God can be prayed to only in three languages, because God may be worshiped in all languages, and will hear the prayers of all men if they are for proper things." Consult: Mombert, *Charles the Great* (New York, 1888); Hefele, *Conciliengeschichte* (Freiburg, 1874). The original canons are in Migne, *Patrol Lat.*, xcvi. See CAROLINE BOOKS.

FRANKFORT-ON-THE-ODER, *o'dër*. The capital of a government in the Prussian Province of Brandenburg, situated on both sides of the Oder, 50 miles east-southeast of Berlin (Map: Prussia, F 2). It consists of the old town on the left bank and a number of suburbs. On the west of the old town are beautiful promenades laid out on the site of the ancient ramparts. Frankfort has a number of fine streets and squares adorned with monuments. Among the older churches are the Church of Saint Mary, a brick building of the thirteenth century, with wood carvings, stained glass, and a candelabrum thirteen feet high, and the Reformed Church, built in the Transition style at the beginning of the thirteenth century, and recently renovated. The splendid Rathaus, dating from the beginning of the seventeenth century, and the municipal theatre, are among the most noteworthy secular buildings. Frankfort has a monument to the poet Ewald von Kleist (q.v.), and an especially fine monument by Unger to Prince Frederick Charles (died 1885). The university, established in 1506, was transferred in 1811 to Breslau. Frankfort has a gymnasium, founded in 1694, Realgymnasium, and a number of other institutions for secondary education. The benevolent institutions include one municipal and four private hospitals, and two orphan asylums.

The manufactures of Frankfort include machinery, boilers, and other iron products, glass articles, pottery, musical instruments, chemicals, chocolate, sugar products, paper, leather, etc. The extensive railway shops furnish employment to over 1000 hands. The trade of Frankfort is, however, in a state of decadence, owing to the proximity of Berlin and to the decline of the town's three annual fairs. There is good water and rail communication, and an electric street railway accommodates local traffic. Population, in 1890, 55,738; in 1900, 61,852, including 4134 Roman Catholics and 747 Jews. The position of Frankfort early gave it great commercial importance in the trade with Poland. After receiving municipal rights in 1253, it soon developed into a commercial centre of considerable magnitude. The town suffered in the Thirty Years' War and the Seven Years' War as well as during the Napoleonic wars.

FRANKINCENSE (from OF. *franc encens*. ML. *francum incensum*, pure incense, from *francus*, pure; probably connected with OHG. *Franko*, Frank. Lat. *Franci*, Franks, AS. *franka*, Icel. *frakki*, spear + *incensum*, incense, from Lat. *incendere*, to burn, from *in*, in + *cendere*, to burn). A name employed to designate various resinous substances which diffuse a strong fragrance in burning, and which are on that account used in certain religious services. There is good reason to believe that the frankincense of the Jews, and also of the ancient Greeks and Romans, was chiefly or entirely the substance

now known as *olibanum* (q.v.), the product of an Indian tree, *Boswellia serrata*. It was formerly supposed to have been obtained from some species of *Juniperus*, which are generally believed not to yield such a product; the prized frankincense of the ancients was brought from the East. Several trees, such as certain species of *Protium* and of *Croton*, yield substances used as frankincense in place of *olibanum*. The silver fir in Europe furnishes a resinous product which is the common frankincense of the pharmacopœias. American turpentine is also often sold under this name. It is used in the composition of stimulating plasters, etc. Burgundy pitch is made from it. It is a spontaneous exudation from the tree, hardening by exposure to the air, and is generally of a whitish or pinkish color, with a rather agreeable odor and a balsamic taste. See BOSWELLIA; FIR.

FRANKING PRIVILEGE. The right of sending mail matter free of charge. In England this privilege was secured to members of Parliament at first by warrant of the Postmaster-General and latterly by statute. It was abolished in 1840. In this country the privilege was accorded by statute to Revolutionary soldiers in actual service, to various executive officers of the United States Government, as well as to Senators and members of Congress. It was abolished in 1873, but formally restored a few years later, and at present officers of the United States Government may send and receive through the mails all public documents without payment of postage, the name and office of the sender being written thereon. This privilege does not extend, however, to those officers who are authorized to make requisitions upon the Postmaster-General for official postage stamps. Seeds and agricultural reports may be mailed free by the Commissioner of Agriculture and by members of Congress. The franking privilege is frequently abused. As no penalty is attached to the improper use of the frank, it has been recommended that a penalty be imposed by act of Congress. Many officers are allowed to send their communications in unstamped envelopes marked 'official business.' An unlawful use of such an envelope subjects the user to a penalty of \$300.

FRANKISH VERSION. See BIBLE.

FRANKL, frän'kl', LUDWIG AUGUST, Ritter von Hochwart (1810-94). An Austrian poet. He was born in Bohemia, of Jewish parentage, and was educated in medicine in Vienna, but preferred journalism and literature. His *Habsburglied* (1832), a series of ballads in chronological order, placed him among the romanticists. Among his best known works are *Sagen aus dem Morgenlande* (1834), and the epic *Christoforo Colombo* (1836). In 1856 he established a school in Jerusalem, and described the condition of the Orient in *Nach Jerusalem* (1858) and *Aus Aegypten* (1860). Jewish subjects are treated by him in the two poems *Rahel* (1842) and *Der Primator* (1864), and in the historical work *Zur Geschichte der Juden in Wien* (1853). Frankl also took an active interest in the philanthropic work of Vienna and in public affairs, especially in 1848, when the liberal spirit of his poetry made him widely known.

FRANK'LIN. A district of Canada, formed in 1895. It is composed of numerous large and small islands north of the mainland, including

Baffin Land and Prince Albert Land (Map: Canada, N 2). The area is estimated at 299,000 square miles. Franklin is mostly within the Arctic Circle, and is almost wholly destitute of animal and vegetable life. The only inhabitants are some Eskimo on Baffin Land.

FRANKLIN. A city and the county-seat of Johnson County, Ind., 20 miles south of Indianapolis; on the Cleveland, Cincinnati, Chicago and Saint Louis and the Pittsburg, Cincinnati, Chicago and Saint Louis railroads (Map: Indiana, C 3). It is the seat of Franklin College (Baptist), opened in 1834, and has fine county buildings. The city is in an agricultural region; its industrial establishments include a foundry, elevators, flour, planing, and saw mills, etc. Population, in 1890, 3781; in 1900, 4005.

FRANKLIN. A city and the county-seat of Simpson County, Ky., 133 miles south by west of Louisville; on the Louisville and Nashville Railroad (Map: Kentucky, E 4). It has the Franklin Female College and Franklin Military Institute. The industrial establishments include flouring-mills, a planing-mill, a woolen-mill, brick-works, etc. Population, in 1890, 2324; in 1900, 2166.

FRANKLIN. A town and the parish-seat of Saint Mary Parish, La., 100 miles west by south of New Orleans; on Bayou Teche, and on the Southern Pacific Railroad (Map: Louisiana, D 4). The bayou is navigable for steamers, and the town carries on a considerable trade in cotton, sugar, fruits, etc. There are several sugar and saw mills. Population, in 1890, 2127; in 1900, 2692.

FRANKLIN. A town in Norfolk County, Mass., including the village of Unionville, 27 miles southwest of Boston; on the New England Railroad (Map: Massachusetts, E 3). It has an almshouse, a public library, and Dean Academy, an endowed school for both sexes. Its manufactures include pianos, straw hats, and cotton, woolen, and felt goods. Franklin was originally a part of Wrentham, and was incorporated as a separate township in 1778. The government is administered by town meetings. Population, in 1890, 4831; in 1900, 5017.

FRANKLIN. A city in Merrimack County, N. H., 95 miles northwest of Boston, Mass.; at the confluence of the Pemigewasset and Winnepesaukee rivers, which here unite in the Merrimack, and on the Boston and Maine Railroad (Map: New Hampshire, H 8). Abundant water-power has contributed materially to the city's industrial importance. There are paper and pulp mills, hosiery-mills, foundries, and manufactures of needles, knitting-machines, woolen goods, boxes, etc. Franklin is famous as the birthplace of Daniel Webster, and has the New Hampshire Orphan's Home. It was incorporated as a town in 1828, and in 1895 received a city charter, now in operation, which provides for a mayor, elected annually, and a unicameral council. The city owns and operates its water-works. Population, in 1890, 4085; in 1900, 5846.

FRANKLIN. A city and the county-seat of Venango County, Pa., 123 miles by rail north of Pittsburg; on the Allegheny River, and on the Allegheny Valley, the Erie, the Western New York and Pennsylvania, and the Lake Shore and Michigan Southern railroads (Map: Pennsyl-

vania, B 2). It has a public library and two fine parks, besides several points of historic interest. The centre of the great oil region of the State, Franklin's chief interest is in oil, though there are also flouring-mills, machine-shops, brick-works, and manufactures of steel castings, tools, and oil-well supplies. Franklin was settled about 1753, and was incorporated in 1795. The government is administered under a special charter of 1868, subsequently amended, which provides for a mayor, elected annually, and a unicameral council. Population, in 1890, 6221; in 1900, 7317.

FRANKLIN. A town and the county-seat of Williamson County, Tenn., 20 miles south of Nashville; on the Harpeth River, and on the Louisville and Nashville Railroad (Map: Tennessee, E 5). It is the seat of the Tennessee Female College, opened in 1856. The town is the centre of a fertile agricultural region, and has several cotton-gins, and manufactures of carriages, flour, lumber, etc. Population, in 1890, 2250; in 1900, 2180. An engagement between the Federal General Granger and the Confederate General Van Dorn occurred here on April 10, 1863, the latter making the attack and being repulsed; and here, on November 30, 1864, was fought the famous battle of Franklin. See **FRANKLIN, BATTLE OF**.

FRANKLIN (from ML. *franchilanus*, from *franchus*, free). An English freeholder of former times, who held his lands of the Crown free from any feudal servitude to a subject superior. He is one of the characters described by Chaucer. In the course of time he lost his dignity, becoming a well-to-do yeoman. Consult: Chaucer, *Prologue to the Canterbury Tales*; Shakespeare, *Henry IV., Part I.* (Act ii., Scene 1, and *Winter's Tale* (Act v., Scene 11).

FRANKLIN, BATTLE OF. A sanguinary battle fought at Franklin, Tenn., on November 30, 1864, between a Federal army of about 25,000, under General Schofield, and a Confederate army of about 40,000, under General Hood. Early in November, 1864, General Schofield, acting under orders from Thomas, took command at Pulaski, Tenn., of a Federal force of about 25,000. On the 21st Hood advanced against this position, and Schofield gradually withdrew before him toward Nashville, under instructions to impede the Confederates until Thomas should have fully prepared himself for action. Confederate movements by the rear and by the right flank were balked by Schofield at Columbia and Spring Hill on the 24th and the 29th respectively, and by a rapid night's march, in which he passed by the sleeping Confederate army. Schofield reached Franklin at dawn of the 30th, and, in the absence of pontoon bridges, immediately set about improvising bridges for transferring his army and stores across the Harpeth River. He also threw up breastworks on the left bank to meet a possible Confederate attack, and stationed General Wagner, with two brigades, somewhat in advance, with instructions to withdraw behind the intrenchment on the approach of the Confederates, without awaiting a general attack. Meanwhile Hood, chagrined over the previous day's failure at Spring Hill, had come up, and at 4 P.M. ordered an attack. Wagner, imprudently delaying, lost heavily, and his men, enveloped by the Confederate advance, hastily retreated

through the Federal centre, which was soon thrown into great confusion. General Opdycke, without orders, threw his brigade into the resulting gap, and thus, by enabling the Federals to reform, saved the day. Thereafter until almost midnight the fighting continued, the Confederates making repeated and desperate assaults only to be beaten back each time with disproportionate loss by the Federals, under the immediate command of Gen. J. D. Cox, General Schofield being on the right bank of the river. During the night Schofield withdrew unmolested to Nashville, where he joined Thomas. The battle is notable for the remarkable gallantry of the Confederates and the stubborn bravery of the Federals. The Federal loss in killed, wounded, and missing was 2326; that of the Confederates, though not accurately known, probably exceeded 6000. Consult: Cox, *The Battle of Franklin* (New York, 1897); id., *The March to the Sea, Franklin and Nashville* (New York, 1882); Johnson and Buel (editors), *The Battles and Leaders of the Civil War*, vol. iv. (New York, 1887); and Nicolay and Hay, *Abraham Lincoln: A History*, vol. x. (New York, 1890).

FRANKLIN, BENJAMIN (1706-90). An American statesman, scientist, and author. He was born in Boston, Mass., January 17, 1706. His father, Josiah Franklin, emigrated to America about 1685, and took up the business of tallow-chandler. His mother, a second wife, was the daughter of Peter Folger, a leading settler, noted for his philanthropy and tolerance. Benjamin, the fifteenth of seventeen children, was named after his father's favorite brother, and, as the tenth son, was intended as the 'tithe for the ministry.' Either on account of poverty or an early perceived distaste on the boy's part, the theological idea was given up. After a year or more at candle-making in his father's shop, Benjamin was apprenticed to his brother James, a printer, and the founder of the *New England Courant*, one of the earliest papers in America. While in this office Franklin learned the trade well, read diligently, and found time to write pieces in the style of the *Spectator*, and even ballads, which he had published in the *Courant* anonymously. For some political opinions James Franklin was imprisoned a month and forbidden to publish his paper. For a while it appeared under Benjamin's name; but there was continual quarreling between the two brothers. At last the apprentice broke his indentures and slipped away by sea to New York. Finding no work there, he went on to Philadelphia, where he arrived friendless and almost penniless. Though only seventeen years old, he was a good printer and of pleasing address, and quickly found both friends and work. In 1725 Sir William Keith, the Governor, induced him to go to England to buy type for a printing shop of his own, promising him a letter which would give him aid in the way of money. Franklin reached England, found his patron's promises worthless, and had to shift for himself. For a year and a half he maintained himself as a printer, living a wild sort of life, and gaining some notoriety by a free-thinking pamphlet which he printed, but afterwards repudiated as immature. Returning to Philadelphia in 1726, he was clerk for a while in a newly started dry-goods shop. He soon got back to printing, however, first with his old employer, Keimer, and then in

an independent shop for which he furnished skill and energy and his partner the money. In 1729 Franklin got control of the *Pennsylvania Gazette*, which Keimer had started, and the excellence of the printing and the spirit of the writing won him a competence and high consideration throughout the Colonies. In 1730 he married Miss Deborah Read, the daughter of the man whom he had lodged with on his first coming to Philadelphia. From this time on he was engaged almost constantly in some sort of public activity, and his achievements were varied. In 1731 he began the Philadelphia Library, chartered in 1742, the first and model of the American system. *Poor Richard's Almanac* he first published in 1732, under the pseudonym of 'Richard Saunders,' and for twenty-five years his witty, worldly-wise sayings in this were very influential in molding the new American character. In 1736 he became clerk of the General Assembly, and the next year was appointed postmaster for Philadelphia. In 1743 he broached a plan for an academy, which was later adopted and developed into the University of Pennsylvania. In 1744 he founded the American Philosophic Society. During this period also he invented the excellent Franklin stove, led in the improvement of the city's lighting, paving, police, and fire departments, and yet found time to conduct the electrical investigations which have placed him in the rank of the great discoverers. In 1752 he made his celebrated experiment with the kite, which demonstrated the identity of lightning with electricity. Franklin's scientific views won their way through surprised incredulity into acceptance both in France and England. The degree of LL.D. was voted him by Oxford, Edinburgh, and Saint Andrews, and he became F.R.S. and was awarded the Copley gold medal in 1775.

In 1753 Franklin was appointed Postmaster-General for the Colonies. In 1754 he was commissioner from Pennsylvania at the Intercolonial Congress which met at Albany to take measures in view of the threatened French and Indian War, and he proposed a plan combining local independence with union. (See ALBANY CONVENTION.) It seems probable that if this plan had been followed many of the causes which led to the Revolution would have been avoided, and perhaps the Revolution itself. When the French and Indian War came on, Franklin assisted Braddock greatly, giving his personal security for supplies and transportation furnished by the Pennsylvania farmers. The descendants of William Penn, the proprietors of the Colony, refused to allow their private lands to be taxed for the support of the English troops, and in 1764 Franklin was sent to England to petition the Crown against this. This mission conducted satisfactorily, he remained in England as the leading representative for the Colonies. His influence in 1766 helped to secure the repeal of the Stamp Act; but he did not fully appreciate the depth of the feeling in America in regard to taxation, and when he urged the colonists to pay the later small tax on tea, he was roundly charged with lack of patriotism. In 1775, seeing war to be inevitable, he returned, and was immediately chosen a delegate to Congress. He was on the committee to draft the Declaration of Independence, and was one of the signers.

During the Revolutionary War Franklin represented American interests in Europe, and par-

ticularly in France. His scientific reputation, his dignity of character, and charm of manner made him extremely popular in French literary, social, and political circles, and his wisdom and fertility of resource secured for the Government aid and concessions which no other man could possibly have obtained. He lent efficient aid to the operations of the American navy and especially of John Paul Jones. Against the vigorous opposition of Necker, his matchless diplomacy got for a country that was bankrupt and almost hopeless loans amounting to many millions of francs. After the defeat of Burgoyne, Franklin was received officially, and in 1778 he concluded a treaty of offensive and defensive alliance with France. In 1782 he signed the preliminary articles of peace, and the next year (September 3, 1783) he was one of the signers of the definitive Treaty of Paris.

In September, 1785, his request to be allowed to return home was granted by Congress; but he had scarcely reached Philadelphia before he was chosen a member of the Executive Council, and soon afterwards he took the position which now corresponds to the Governorship. In 1787 he was a member of the convention to form a national constitution, and in spite of his advanced age was vigorously active in the proceedings. He was deeply interested in all schemes of usefulness and philanthropy, and one of his last public acts was to sign a memorial to Congress, as president of the Pennsylvania Society for the Abolition of Slavery. The last two years of his life were spent in severe pain of body, but in activity of mind. He died April 17, 1790, and was buried in the graveyard of Christ Church, Philadelphia. Upon his death Congress passed resolutions of mourning, and the National Assembly of France, on the motion of Mirabeau, put on mourning for three days.

Franklin's greatest service to America was undoubtedly due to his skill in diplomacy. His public spirit and devotion were reinforced by powers of mind and wisdom that made him practically unrivaled. To his common sense, sagacity, and industry he added great firmness of purpose, a matchless tact, and a broad tolerance. In science, his electrical discoveries, with the invention of the lightning-rod, are very important, and besides these, many other discoveries and inventions are to be credited to him. His literary reputation rests chiefly on his unfinished *Autobiography*, a book which is an epitome of his life and character, expressed in wonderfully clear and simple style. His newspaper and his almanac were the organs through which he spread his practical morality and wisdom, and they and his letters reflect his distinctively American humor. He was never deliberately an author; all his writing was done with a practical aim, and derives its value largely from the accuracy with which it reflects his character. He was remarkably deficient in poetic imagination and in ability to appreciate the spiritual side of man's nature. For a while during his youth he was a skeptic, and he was never an orthodox Christian; but his attitude when he died was such that to-day he would have been classed with the 'liberal Christians.'

In person Franklin was about 5 feet 9 or 10 inches in height, and well built. His complexion was fair, his eyes gray, and his manners extremely affable and winning. None of his descendants

bear his name, the last who did so being William Temple Franklin, who died in 1823. There are many descendants of his daughter, who married a Mr. Bache.

FRANKLIN, Sir JOHN (1786-1847). An Arctic explorer, born at Spilsby, Lincolnshire, England. His father had intended him for the Church, but giving way to the boy's strong desire to follow the sea, secured for him a midshipman's appointment in the navy in 1800. He was first attached to the *Polyphemus*, with which he served in the Baltic, and took part in the battle of Copenhagen, April 2, 1801. His next service was with the *Investigator*, which, under command of Captain Matthew Flinders, was sent to survey the Australian coast. In this expedition Franklin's aptitude for scientific study first attracted attention, his astronomical and nautical observations being of considerable value. Returning to England, he was assigned as signal officer to the ship-of-the-line *Bellerophon*, in which, in 1805, he participated in the battle of Trafalgar. In 1808 he became a lieutenant, and in 1814 accompanied the British expedition against New Orleans, in the attack upon which he was wounded. Franklin's career as an Arctic explorer began in 1818, with his appointment to the command of the *Trent*, a brig that had been fitted out to accompany Captain Buchan in the *Dorothea* in an attempt to sail to the north of Spitzbergen, and cross the Polar Sea by that route. The attempt proved a failure, but Franklin's scientific knowledge and enthusiastic interest in Polar explorations became known, and in the following year he was placed in command of an expedition, which was destined to cross overland from Hudson Bay to Rupert's Land, and explore the northern coast of the continent eastward from the Coppermine River, acting in conjunction, if possible, with Lieutenant Parry, who was dispatched with two vessels to Lancaster Sound. Franklin's party spent three winters in the north, suffered the greatest privations, traveled over 5500 miles, and added much to the geographical knowledge of the north coast-line of North America. On his return to England he was promoted to the rank of captain, and was elected a fellow of the Royal Society. In 1825 he was off again to the Arctic regions, descended the Mackenzie River to its mouth, near which he wintered, and then dividing his party, sent some of them under Dr. Richardson eastward as far as the Coppermine River, while he himself proceeded along the Alaskan coast westward as far as Point Beechey, in longitude 149° 37' west. He returned to England in September, 1827. In 1829 he was

knighted, and in recognition of his services to geographical science received the honorary degree of D.C.L. from Oxford, and the gold medal of the Geographical Society of Paris. From 1830 to 1833 Franklin commanded the *Rainbow* frigate on the Mediterranean station, and won the appreciation of the Greeks, and a decoration from King Otho for services rendered them during their war of liberation. From 1836 to 1843 Sir John was Lieutenant-Governor of Van Diemen's Land, now Tasmania, and the period of his administration was one of the greatest progress the colony had ever known. On his return to England he found that an expedition was being planned by the Admiralty to make another attempt to discover the Northwest passage. Sir John sought and obtained command of the proposed expedition. It consisted of the *Erebus* and *Terror*, with 138 officers and men, and left England on May 18, 1845, with the intention of sailing direct to Cape Walker, and thence southward and westward in the direction of Bering Strait, as far as the ice and land would permit. The ships were last seen on July 26, 1845, by a Scotch whaler in Baffin Bay. In the summer of 1847, in which Franklin had planned to return, as no word had been received from him, uneasiness began to be felt, and an expedition for his relief was planned in England. When the winter of 1847-48 passed without news from the expedition the uneasiness increased, and in the spring of 1848 began a remarkable series of relief and search expeditions from both England and the United States, numbering thirty-nine all told up to 1857, and involving an expenditure of over a million pounds sterling. In 1854 Dr. Rae, conducting a search party sent out by the Hudson's Bay Company, came across the first traces of the ill-fated expedition, but it was not until 1859 that the expedition sent out in 1857 by Lady Franklin (1792-1875), under Captain McClintock, decided the fate of Sir John and his comrades, and at the same time established the fact that he had actually achieved what he had set out for, the discovery of the long sought Northwest passage. From the brief records found by McClintock it was learned that, after ascending Wellington Channel, which separates North Devon and Cornwallis Island to latitude 77° N., and returning by the west side of Cornwallis Island, the ships had wintered, in 1845-46, at Beechey Island, on the southwest coast of North Devon (in latitude 74° 43' 28" N.); that in the fall of 1846 an attempt had been made to reach the North American coast by sailing through the channel which separates Prince of Wales and North Somerset Islands, but that progress had been arrested by heavy ice when within twelve miles of the north end of King William's Land, where the party remained all winter, and where on June 11, 1847, Sir John Franklin had died; and that the ships were abandoned there by Captain Crozier and the 105 survivors of the party, who on April 26, 1848, started southward over the ice for the Great Fish River, on the Continent, but never reached their destination. Franklin was promoted to be rear-admiral in 1852, five years after his death. Sir John Franklin published the results of his first two Polar expeditions under the titles *Narrative of a Journey to the Shores of the Polar Sea in the Years 1819-22* (1823), and *Narrative of a Second Expedition to the Shores of the Polar Sea in 1825-27* (with

Dr. Richardson) (1828). Consult also: McClintock, *Narrative of the Fate of Sir John Franklin* (London and Boston, 1860); Osborn, *The Career, Last Voyage and Fate of Sir John Franklin* (London, 1860); Beesly, *Sir John Franklin* (London, 1881); Markham, *The Life of Sir John Franklin, and the Northwest Passage* (London, 1891); and Traill, *Life of Sir John Franklin* (London, 1896).

FRANKLIN, SAMUEL RHODS (1825—). An American naval officer, brother of Gen. W. B. Franklin (q.v.). He was born in York, Pa., entered the United States Navy as an acting midshipman in 1841, participated in the capture and occupation of Monterey, Cal., during the Mexican War, was assistant professor of ethics and English at the United States Naval Academy in 1854, and in September, 1855, became a lieutenant. During the Civil War he became lieutenant-commander in July, 1862, served in the Western Gulf Blockading Squadron in 1863, and later as assistant to Commodore Palmer at New Orleans in 1863-64, and in the spring of 1865 served on the staff of Acting Rear-Admiral Thatcher in Mobile Bay. In 1873 he was promoted to be captain. He was chief-of-staff to Admirals Case and Worden successively; served for a time in the European Squadron; was president of the board of examiners for the promotion of officers in 1877; was hydrographer to the Bureau of Navigation from 1877 to 1880; became a commodore in May, 1881; was superintendent of the Naval Observatory in 1884-85; was promoted to be rear-admiral in January, 1885; commanded the European Station from 1885 to 1887; and in 1887 retired from active service. In 1889 he was president of the International Marine Conference. He published *Memories of a Rear-Admiral* (New York, 1898).

FRANKLIN, STATE OF. See TENNESSEE and NORTH CAROLINA.

FRANKLIN, WILLIAM (1729-1813). A Colonial Governor of New Jersey. He was born in Philadelphia, and was a natural son of Benjamin Franklin, who acknowledged him and brought him up in his household. During King George's War, William served in the Pennsylvania line on the Canadian frontier, and became a captain before he was of age. In 1754 he was comptroller of the general post-office, and for a time was clerk of the provincial assembly. Going with his father to England, he was there admitted to the bar (1758), and in 1762 was appointed Governor of New Jersey. Now a Tory, though hitherto a Whig, his time-serving character disgusted the colonists. During the Revolutionary War he remained loyal to England, and was kept under surveillance by the patriots. He gave his word that he would not leave the province; but in consequence of summoning a meeting of the old colonial assembly, he was arrested and sent to Connecticut, and kept a prisoner for two years. In November, 1778, he was exchanged and took refuge in New York. In 1782 he went to England, where he died. His political course caused an estrangement between him and his father, though later they were partially reconciled.

FRANKLIN, WILLIAM BUEL (1823-1903). An American soldier, prominent on the Federal side in the Civil War. He was born at York, Pa., graduated at West Point in 1843, and for the next three years was engaged in topographical work.

In the Mexican War he accompanied General Wood on his march through Coahuila. He subsequently was assistant professor of natural and experimental philosophy at West Point from 1848 to 1852, and thereafter until the outbreak of the Civil War was engaged on various engineering works of importance, becoming chief of the Construction Bureau of the United States Treasury Department in March, 1861. On May 17, 1861, he was promoted to be brigadier-general of volunteers, in which capacity he served in the first battle of Bull Run, and commanded successively a division and the Sixth Army Corps of the Army of the Potomac in the Peninsular campaign under General McClellan. On June 30, 1862, he was brevetted brigadier-general in the regular service, and on July 4th was promoted to be major-general of volunteers. He subsequently commanded the Sixth Corps of the Army of the Potomac in the Maryland campaign, being in command in the battle of Crampton's Gap, and participating in the battle of Antietam; and commanded the left grand division of the Army of the Potomac in the Rappahannock campaign, participating as such in the battle of Fredericksburg, his conduct in which caused his temporary relief from active service. He then served in the Department of the Gulf, where for some months he commanded the Nineteenth Army Corps, and the troops in western Louisiana, and on April 8, 1864, was wounded in the battle of Sabine Cross Roads. From December, 1864, to November, 1865, he was president of the board for retiring disabled officers, at Wilmington, Del. On March 13, 1865, he was brevetted major-general in the regular army. He resigned from the volunteer service on November 10, 1865, and from the regular army on March 15, 1866. Subsequently he became vice-president of the Colt's Firearms Manufacturing Company at Hartford, Conn., in November, 1865; was president of the board of managers of the National Home for Disabled Volunteer Soldiers from 1880 to 1899; and in 1889 was commissioner-general of the United States to the Paris Exposition.

FRANKLIN, WILLIAM SUDDARDS (1863—). An American physicist and electrical engineer, born at Geary City, Kan. He graduated at the University of Kansas in 1887. After further studies in Germany and at Harvard University, he was appointed assistant professor of physics at the University of Kansas (1887). From 1892 to 1897 he was professor of physics and electrical engineering at Iowa State College, and in 1897 was appointed to the same chair at Lehigh University. His publications include *The Elements of Physics*, and *The Elements of Alternating Currents*.

FRANKLIN AND MARSHALL COLLEGE. An educational institution under the care of the Reformed Church, established by the union of Franklin College and Marshall College. Franklin College was organized at Lancaster, Pa., in 1787, and named in honor of Benjamin Franklin, one of its benefactors; Marshall College, named after John Marshall, was established by the Reformed Church at Mercersburg, Pa., in 1836, in connection with its theological seminary. In 1853 the two institutions were consolidated at Lancaster under a new charter. The theological seminary is affiliated with the college,

as is also a preparatory academy. The value of the college buildings and grounds, including Science Hall, erected at a cost of \$70,000, is estimated at \$210,000; the endowment is \$200,000, and the annual income nearly \$30,000. Degrees are conferred in the arts and in divinity. In 1902 the student enrollment was over 300, of whom one-half were in the preparatory department.

FRANKLIN COLLEGE. A Baptist educational institution founded at Franklin, Ind., in 1834. The college offers courses in letters, science, and the humanities, leading to appropriate degrees. The student enrollment in 1902, including the preparatory department, was 200. At the same time the total value of the college property was over \$400,000 of which somewhat more than one-half represented productive funds.

FRANKLIN INSTITUTE, OF THE STATE OF PENNSYLVANIA, FOR THE PROMOTION OF THE MECHANIC ARTS. A learned institution at Philadelphia, Pa., established in 1824 for the purpose of disseminating knowledge of the arts and sciences, and combining in one organization features of the Mechanics' Institutes and of the exclusive scientific societies. The objects of the Institute are attained by means of lectures, reports, a journal, libraries, exhibitions, and school instruction. The lectures, originally giving systematic courses of instruction, now have the object of presenting the latest advances in art and sciences, in the form of popular lectures and of strictly technical discussions before the sections into which the Institute is divided. In 1834 a volunteer committee was formed to examine and report on new machines, inventions, and discoveries. The committee is now elective and consists of 60 members, whose labors have given a notable reputation to the Institute. The publication of a Journal was begun in 1826, and has continued uninterruptedly. It is issued monthly and contains the record of the Institute's work and contributions relating to the growth of science and American industries. The library, devoted exclusively to science and the useful arts, contains about 55,000 volumes, 38,500 pamphlets, besides maps, charts, and photographs. It is the public depository of the Congressional district, and has important collections of American, British, French, German, Swiss, Russian, and Austrian patent records, and complete series of reports on public works. In 1824 the Institute held the first exhibition of American manufactures, and has since held 29 exhibitions, the last in 1899. It grants medals, premiums and certificates for notable inventions. A school of mechanical and architectural drawing was established in 1824 and still exists. There are also night-schools of machine design and naval architecture. A school for instruction in English and ancient and modern languages was established in 1826, and became the model on which the Central High School was founded. It was abandoned when the public high-schools were established. Membership in the institution is open to all persons of legal age on payment of yearly dues. Its building stands at 15 South Seventh Street.

FRANKLINITE. An iron-black, slightly magnetic mineral with a metallic lustre, consisting of ferric and manganic oxides in combination with ferrous, manganous, and zinc oxides. It crystallizes in the isometric system, but is

found both crystallized and massive. In Germany it is also found in the form of cubic crystals, but it occurs chiefly in Sussex County, N. J., at Franklin Furnace, Mine Hill, and at Sterling Hill, being found in veins of limestone in zinc-mines. Owing to the manganese that it contains, it is used as an ore for making Bessemer steel.

FRANKLIN'S TALE, THE. One of Chaucer's *Canterbury Tales*. It narrates the adventures of the faithful Dorigen, as they are recounted in Boccaccio's *Decameron*, in the fifth story of the tenth day, although the franklin claims his story is taken from a Breton lay. The narrator himself is a jolly open-handed ex-sheriff and knight of the shire.

FRANKMARRIAGE (*liberum maritagium*). A species of estate tail existing by the common law of England. It arose where a man, on the marriage of his daughter or other female relative, gave lands to the bridegroom, with a provision limiting the inheritance to the issue of the marriage. It was, therefore, a form of fee tail special. This tenure was called *liberum maritagium*, to distinguish it from other species of estate tail. Four things were necessary to a gift in frankmarriage: (1) That it must be in consideration of a marriage, but it might be as well after as before a marriage; (2) that the woman with whom it is given be of the blood of the donor; (3) that the donees should hold of the donor (hence a gift in frankmarriage by a subject became impossible after the statute *quia emptores*); (4) that the donees should hold for four generations. Therefore a reservation of a remainder to a stranger to take effect within four generations was a void limitation upon a gift in frankmarriage.

FRANK-PLEDGE. An ancient principle of English law, prevailing before the Norman Conquest, whereby the members of every tithing or community of freemen were responsible for the good conduct of each other. This responsibility consisted in every ten men in a village being answerable each for the others, so that if one committed an offense, the other nine were liable for his appearance to make reparation. Should the offender abscond, the tithing, if unable to clear themselves from participation in the crime, were compelled to make good the penalty. This law has been ascribed to Alfred the Great; but it would appear to have been in existence at a much earlier period. Mr. Hallam observes: "The peculiar system of frank-pledges seems to have passed through the following very gradual stages. At first, an accused person was bound to find bail for standing his trial. At a subsequent period, his relations were called upon to become securities for payment of the compensation and other fines to which he was liable; they were even subject to be imprisoned until payment was made, and this imprisonment was commutable for a certain sum in money. The next usage was to make people already convicted, or of suspicious repute, give securities for their good behavior. It is not till the reign of Edgar that we find the first general law, which places every man in the condition of the guilty or suspected, and compels him to find a surety who shall be responsible for his appearance when judicially summoned. This is perpetually repeated and enforced in later statutes during his reign and that of Ethelred.

Finally, the laws of Canute declare the necessity of belonging to some hundred and tithing, as well as of providing sureties." (*Middle Ages*, ii. 80.)

The court of frank-pledge, or court leet, was a court of record held once in the year, within a particular hundred, lordship, or manor, before the steward of the leet. The business of this court was to present by jury all crimes committed within their jurisdiction, and to punish all trivial misdemeanors. This court has practically fallen into desuetude, and the business is discharged by the justices of the peace at general and petty sessions. Originally, the business of the court of frank-pledge was confined to taking securities or free pledges for every person within the jurisdiction; but this practice having fallen into disuse, the court gradually acquired a criminal jurisdiction concurrent with that of the sheriff's tourn. See COURT BARON; COURT LEET; MANOR.

FRANKS, THE. The name borne by a confederation of Germanic tribes which appeared on the lower and middle Rhine in the third century after Christ, and subsequently overthrew the Roman power in Gaul. Though the name is first encountered about the year 240, the individual tribes constituting the confederation were known to the Romans as early as the time of Augustus. Chief among these were the Sali, the Sigambri, the Chamavi, the Bructeri, the Ampsivarii, the Chatti, the Tubantes, the Usipetes, and the Batavi. Their first appearance within the Empire was in the year 253, and as early as the beginning of the fourth century they had established themselves in what is now Brabant. Quite early they became separated into two distinct groups—the Salian Franks, who dwelt on the lower stretches of the Rhine and its affluents, and whose name is supposed to have been derived from the River Yssel (Isala or Sala), and the Riparian Franks or Riparii, whose territories lay on both banks of the Rhine along its middle course. The Salian Franks were defeated by Constantine the Great in 306, and by Julian in 358, and became the allies of the Romans, who intrusted to them the defense of the border. During the first decade of the fifth century, the Salian Franks, carried away by the onrush of the other Germanic nations into Gaul, turned upon the Roman provinces, captured Treves, and soon became the masters of a large extent of territory on the Meuse and the Scheldt, acknowledging, however, the suzerainty of the Romans. They fought under Aëtius against Attila on the Catalaunian Fields, in 451, and remained on friendly terms with the Romans till after the fall of the Western Empire.

The real greatness of the Franks dates from the Salian Clovis or Chlodwig (481-511), a descendant of the fabled Meroveus, who in 486 overthrew the Roman patrician Syagrius at Nogent, near Soissons, and ten years later vanquished the powerful confederacy of the Alemanni. The Burgundians, the Visigoths of Aquitaine, and the Riparian Franks were likewise subjugated and the limits of the Frankish kingdom were extended from the Pyrenees to Friesland, and from the Atlantic to the Main. Under the influence of his wife, Clotilda, Clovis had accepted Athanasian Christianity in 496, and in his campaigns against the Arian Goths and Burgundians he acted in part as the champion of orthodoxy, thus marking the beginning of the close connection between the Frankish monarchy and the Roman Catholic

Church. After the death of Clovis the kingdom was divided among his four sons. Theodoric ruled at Metz, Chlodomer at Orleans, Childebert at Paris, and Clotaire at Soissons. Thuringia, Burgundy, and Provence were acquired before 558, in which year Clotaire became sole ruler of all the Frankish lands. After Clotaire's death, in 561, the kingdom was again divided among his four sons. Austrasia, with a population predominantly Germanic, fell to Sigebert, who made his capital at Metz; Neustria, comprising part of the Gallo-Roman Provinces, was assigned to Chilperic, with his capital at Soissons; Aquitaine fell to Charibert; Burgundy, with its capital at Orleans, was ruled by Guntram. In 567 Charibert died, and his dominions were divided among his brothers. The period that follows is one of internecine strife among the descendants of Meroveus, marked by the foulest crimes and excesses, and resulting in the decay of the Merovingian power. In the prevailing anarchy the great nobles who had been intrusted with the government of the provinces seized the opportunity to make themselves virtually independent and their offices hereditary. (See BRUNHILDA; FREDEGONDA; MEROVINGIANS.) Clotaire II. in 613 once more reunited the lands of the Frankish Crown; but the kings from this time ceased to exercise any influence, and the real power passed into the hands of the great officers of State, the chamberlain, the keeper of the seal, chief of all the mayor of the place (*mayor-domus*). This office existed in all three of the Frankish kingdoms, but it was in Austrasia that a powerful family arose which held exclusive possession of the mayoralty for more than a hundred years, ruling as monarchs in fact, if not in appearance. This was the race of the Carolingians (q.v.). Pepin of Landen was *mayor-domus* of Austrasia under Dagobert II. (628-38), and was succeeded by his son Grimoald, who died in 656. Thirty years of confusion followed, during which the Frankish lands were repeatedly portioned out and reunited, until, in 687, Pepin of Heristal, the Austrasian mayor of the Palace, overthrew the forces of Neustria and Burgundy in the battle of Testry, and thenceforth ruled as the *mayor-domus* of a united Frankish kingdom. His son, Charles Martel (714-741), extended the frontiers of the kingdom in the east, and in 732 repelled the tide of Saracen invasion in the battle of Tours or Poitiers. Charles's son, Pepin the Short, ruled in conjunction with his brother Karlmann till 747; and after that, alone. In 751 Childeric III., the last of the Merovingians, was deposed, and Pepin ascended the throne with the consent of the Pope. Under Charles the Great (q.v.), the son of Pepin, the Frankish power attained its greatest development. Germans and Latins were united under Charles's sway, which extended from the Ebro to the Eider, and from the North Sea to Croatia and Slavonia. The most powerful monarch in Europe, he became also the secular head of the Church, continuing in this manner the tradition of the old Roman Empire. His coronation as Roman Emperor took place in 800. Charles's successor, Louis the Pious, showed himself unequal to the task of holding together the huge empire which his father had created. Civil strife disturbed the last years of his reign. In 841, the year after his death, his sons, Lothair, Louis the German, and Charles the Bald, fought the decisive battle of

Fontenay; and two years later, at Verdun, the Frankish Empire was partitioned among them. (See VERDUN, TREATY OF.) This marks the virtual dissolution of the Frankish monarchy, though Charles the Fat succeeded for a moment (884-87) in reëstablishing the Empire. Its place is henceforth taken by the nations of France, Germany, and Italy.

The rôle played by the Franks in the history of Europe was one of capital importance. Of all the barbarian peoples they showed themselves the most capable of assimilating the Roman culture of the countries which they conquered. Civilized, they became in turn the civilizers of the German stocks which had remained in their homes beyond the Rhine. Charles's campaigns against the Saxons carried Christianity into Northern Germany. The elaborate machinery of government which he set up within the Empire established order and respect for the law in Europe, after such a manner as had not been known since the best days of the Roman Empire. Unlike the absolutism of Rome, however, the Frankish monarchy knew how to reconcile Imperial power with the rights of the subjects, as shown in the retention of the national and local assemblages of freemen or representatives of freemen. Frankish law influenced profoundly the legal systems of all the nations of Western and Central Europe. (See SALIC LAW.) Most important of all, however, was the close connection between the Frankish monarchy and the Catholic Church. The donations of Pepin and Charlemagne and the establishment of a new Roman Empire may be said to have determined the general features of the political history of Europe during the Middle Ages. Consult: Perry, *The Franks* (London, 1857); Sismondi, *The French Under the Merovingians* (London, 1850); Church, *Beginning of the Middle Ages* (New York, 1877); Emerton, *Introduction to the Study of the Middle Ages* (Boston, 1888); Guizot, *History of Civilization* (Eng. trans. New York, 1861); Thierry, *Récits des temps mérovingiens* (Paris, 1882); Favre, *L'empire des Francs* (Paris, 1888); Fustel de Coulanges, *Histoire des institutions politiques de l'ancienne France* (Paris, 1888-89); Arnold, *Frankische Zeit* (Gotha, 1883); Waitz, *Deutsche Verfassungsgeschichte* (Kiel, 1882).

FRANKS, Sir AUGUSTUS WOLLASTON (1826-97). An English archaeologist. He was born in Geneva, Switzerland, and was educated at Eton and at Trinity College, Cambridge. He was long associated with the British Museum as custodian of the department of British and mediæval antiquities and ethnography. During the last five years of his life he was president of the Society of Antiquaries. His knowledge of Oriental ceramics was most extensive, and he gave much porcelain and pottery to the British Museum. In the department of Renaissance art he was also an acknowledged authority. His publications include: *Book of Ornamental Glazing Quarries* (1849); *Examples of Ornamental Art in Glass and Enamel* (1858); *Himyaritic Inscriptions from Southern Arabia* (1863); *Catalogue of Oriental Porcelain and Pottery* (1876-78); *Japanese Pottery* (1880); and *Catalogue of a Collection of Continental Porcelain* (1896).

FRANSCINI, frân-shĕ'nĀ, STEFANO (1796-1857). A Swiss political economist and statistician, born at Bodio in the Canton of Ticino.

In 1830 he was elected Chancellor of his canton, and he was reelected in 1844. In 1848 he was elected member of the Federal Council. In his works *Statistica della Svizzera* (1828) and *Statistica della Svizzera italiana* (1837-39) he may be said to have laid the foundation of statistical science in Switzerland.

FRANSECKY, fräns'ki, EDUARD FRIEDRICH VON (1807-90). A German general, born at Geden, Hesse. He entered the Prussian Army in 1825, and in 1843 was called to the general staff. He fought with distinction in the Danish War of 1848, and in the Austro-Prussian War of 1866, where by his obstinate resistance against powerful odds he helped to decide the engagement at Münchengrätz and also took a prominent part in the battle of Sadowa. As commander of the Second Army Corps during the War of 1870-71, he succeeded, after a forced march, in reaching the battlefield of Gravelotte in time to attack the heights of Point-du-Jour with the First Army, an action which contributed materially toward deciding the battle. On December 1st he received command of the German forces between the Seine and Marne rivers, and on the following day repelled General Ducrot's attempt to break through the lines at Champigny and Brie. He was the chief adviser of Manteuffel in the operations of that general against the Army of the East under Bourbaki, and after numerous engagements compelled the French to retreat into Switzerland. In recognition of his services he received a handsome sum from the Government, and was appointed Governor of Berlin in 1879. He resigned in 1882.

FRANTZ, fränts, KONSTANTIN (1817-91). A German publicist. He was born near Halberstadt, was educated at Halle and Berlin, and after acting as private secretary in the Berlin Foreign Office was attached to the consular service in Spain for three years (1853-56). The central idea expressed in his numerous works is the ultimate and inevitable confederation of Europe, with the Teutonic peoples as a nucleus. The principal works of this gifted writer include: *Der Föderalismus als das leitende Princip für die soziale, staatliche und internationale Organisation* (1879); and *Die Weltpolitik* (1883).

FRANTZIUS, frän'tsi-us, ALEXANDER VON (1821-77). A German explorer. He was born at Danzig, and became established as a physician at Alajuela, and later at San José, Costa Rica, where he made extensive explorations, the results of which he published upon his return to Germany. His works include: *Beiträge zur Kenntnis der Vulkane Costa-Ricas* (1861); *Das rechte Ufer des San Juanflusses* (1862); *Der südöstliche Teil von Costa-Rica* (1869); *San Salvador und Honduras im Jahre 1576* (1873). Several of his works have been translated into Spanish by Cortés, Carazo, and Twilight.

FRANZ, fränts, JULIUS (1824-87). A German sculptor. He was born in Berlin, and was taught by Wichmann and Fischer at the Academy of Art in that city. After gaining valuable experience in the studios of Fischer, Wredow, Tieck, and Rauch he produced his first important work, "Shepherd and His Dog in Conflict with a Lion" (1851, in the Sans-souci Garden near Potsdam). Many of his works are decorative rather than artistic in character. Among the colossal groups executed by him in sandstone may be mentioned: "America

and England" (Berlin Börse); "Prussia and Hanover," after a design by F. A. Fischer (Belle-Allianceplatz, Berlin).

FRANZ, ROBERT (1815-92). A celebrated German composer, born at Halle. The family name was originally Knauth, but in 1847 it was officially changed. In spite of the opposition of his parents, Robert early began to study music, and when twenty years of age went to Dessau, where he was for two years a pupil of Friedrich Schneider. Upon his return to Halle he devoted himself to the study of the great masters of music, especially Bach, Handel, and Schubert; but it was not until 1843 that his first collection of songs was published. Schumann, Liszt, and Mendelssohn praised them highly, and this success gained for him a position as organist at the Ulrichskirche. He later became conductor of the Singakademie, and director of music at the university. In 1868 Franz was compelled to resign his positions on account of deafness and ill health, and he was only kept from poverty by a series of benefits given by his friends in Germany and America. His arrangements of some of Handel's and Bach's works are standard, but it is as a song-composer that his fame is assured. His two hundred and fifty-seven songs, which are written for solo voice and piano accompaniment, are similar in style to those of Schumann and of Schubert, and are scarcely excelled by theirs. In addition to his songs he composed a number of sacred works, the best of which are his six chorals. He died in Halle. There are a number of biographical sketches of Franz by Ambros, Saran, Schäffer, Schuster, etc., of special note being that by Waldmann, *Gespräche aus zehn Jahren* (Leipzig, 1895).

FRANZ-DREBER, fränts' drä'bër, See DREBER, HEINRICH FRANZ.

FRANZÉN, frän'-tsan', FRANS MICHAEL (1772-1847). A Swedish author and poet, born at Uleåborg (Finland). While professor at the Academy of Åbo, he published his first volume of poems (1794). After the annexation of Finland to Russia (1809), he lived in Sweden, and became successively pastor at Örebro, and Bishop of Hernösand (1831). He excelled in lyric poetry, particularly religious songs, some of which are accounted among the best in the Swedish language. His works include: *Skaldestycken* (1824-61), *Stamlade Dikter* (1867-69), and *Valda Dikter* (1871), lyric poems; *Gustav Adolf i Tydskland* (1817-18), an incomplete national epic; *Christopher Columbus* (1831); *Emili eller en afton i Lappland*; *Svante Sture*; and *Lappflickan i Kungsträdgården*. His *Minnesteckningar* (1848-60), a collection of biographies of prominent Swedes, are models of their kind.

FRANZENSBAD, fränts'ens-bätt. A fashionable watering-place in Bohemia, Austria, situated about 1450 feet above the sea, in a somewhat barren, rolling country, four miles northwest of Eger (Map: Austria, C 1). The town is pleasantly laid out with shady streets and charming parks, and is fully equipped as a health resort. It is chiefly famous for its chalybeate and saline springs, impregnated with carbonic-acid gas. They are twelve in number, and are considered especially efficacious for anæmia and diseases of women. The mud baths (*Moorbäder*), formed by mixing warm mineral water with pulverized mineral earth, are employed in cases of rheuma-

tism and skin diseases. Population, in 1890, 2400; in 1900, 2330. The waters of Franzensbad were mentioned as early as the sixteenth century, and the town was founded by Francis I. in 1793.

FRANZENSKANAL, fränts'en - kä - näl, or BÁCSEK CANAL. A canal of Hungary, since 1801 connecting the Danube and the Theiss. It is 67 miles long, 65 wide, and 6½ feet deep.

FRANZ-JOSEF LAND, fränts'yö'zëf lânt. An Arctic archipelago, north of Nova Zembla, and east of Spitzbergen, lying north of Asia, mainly between latitudes 80° and 82° N., and longitudes 42° and 63° E. (Map: Arctic Regions, G 4). It was discovered in 1873 by the Austro-Hungarian expedition under Weyprecht and Payer, and named in honor of their Emperor. It is a group of about sixty small islands separated by fiords, channels, and sounds. As far as explored, the greatest distance across the archipelago is about 220 miles along the parallel 80½ N., and its greatest breadth is 165 miles along the fifty-ninth meridian. The Queen Victoria Sea lies to the north and west. The western group of islands in the archipelago is called Alexandra Land. Separated by the British Channel on the east, lies the group known as Zichy Land. Still farther east, beyond Austria Sound, lies the Wilczek Land group. Franz-Josef Land is a tableland, generally from 400 to 500 feet above the sea. In numerous places, however, the altitude reaches 1000 feet, and in Wilczek Land about 2600 feet. The surface is formed of basaltic rocks which protrude occasionally through the thick covering of ice and snow. Beneath these layers of rock are strata of soft shales, clay, sandstones, and marl. Fossil plants and animals have been found in these lower strata. Glaciers abound.

The absence of the sun from the middle of October to the last of February sufficiently marks the polar character of the climate. The average temperature in the coldest month is about -20° F., and of the warmest month 35° F. The degree of cloudiness varies from about 50 per cent. in winter to 85 per cent. in summer. Dense fogs often prevail. The winds are chiefly from the east or west, with a marked tendency to blow from the north. Violent gales continue for days at a time. There are magnificent auroral displays. The chief plants of Franz-Josef Land are lichens, mosses, and grass. The willows, heaths, and sedges usually found at even this high altitude in other countries are here lacking. Of flowering plants, the chief are the yellow and white poppy, cresses, *Draba alpina*, scurvy-grass, *Cerastium alpinum*, *Saxifraga*, Alpine foxtail grass, and *Poa cenesia*. The vascular cryptogams are lacking. Few species of hepaticæ are present. *Marchantia polymorpha* (the common liverwort of Europe and America) being the most prominent. The mosses in numerous places form thick carpets, with a brilliant coloring of green and yellow and bright crimson. Sea-algae are rare, but fresh-water algae are numerous. The lichens grow in profusion up to 600 feet above the sea, and are found at heights of 1000 feet. The variety of mammalian fauna is very limited. Polar bears are relatively plentiful; a few blue foxes are to be seen; walruses are fairly abundant. The saddle-back and ground seals are scarce, but the ringed seals, or 'floe-rats,' are quite common. The avian fauna has been care-

fully studied. It includes the snow-bunting, cider-duck, purple sandpiper, various gulls (the glaucus, kittiwake, and ivory), Richardson's skua, Brünnich's and black guillemots; and the little auk, Brent goose, snowy owl, and Arctic tern. Only half a dozen species of insects have been found.

Franz-Josef Land has been very prominent in the later history of Arctic explorations. It was near Cape Flora that Nansen and Jackson met on June 17, 1896. Wellman was in Franz-Josef Land in 1899; the Duke of the Abruzzi and Prince Amadeus of Savoy explored in this region in 1899-1900; and Cagni reached from here the highest point north that had been made by the end of the nineteenth century. Consult: Weyprecht, *Sulla spedizione polare austro-ungarica* (Triest, 1875); Payer, *New Lands Within the Arctic Circle* (Eng. trans. London, 1876); Greely, *Handbook of Arctic Discoveries* (New York, 1896); Jackson, *A Thousand Days in the Arctic* (New York, 1899). See ARCTIC REGION and POLAR RESEARCH.

FRANZOS, frän-tsös', KARL EMIL (1848-1904). A German journalist and novelist of Jewish descent, noted for his pen pictures of Eastern European life. He was born in Podolia, October 25, 1848. His first volume, *Aus Halb-Asien* (1876), won European success for its brilliant descriptions of life in Galicia, Rumania, and Southern Russia. It was translated into several languages. This was followed by *Vom Don zur Donau* (1878), and many stories, usually of the same scenes that maintained his reputation. Of these the more noteworthy are: *Die Juden von Barnow* (1879); *Ein Kampf ums Recht* (1882); *Tragische Novellen* (1886); and *Der Wahrheit-sucher* (1894).

FRAPAN, frä'pä'n', ILSE. The pseudonym of the German novelist and poet Ilse Levien (q.v.).

FRAPOLLI, frä-pöl'le, LODOVICO (1815-78). An Italian patriot and diplomat, born at Milan. He was forced to enter the Austrian Army in 1831, but left it as soon as he came of age. In 1840 he went to France and studied at the School of Mines. He wrote on the origin and formation of the earth, and on the geology of Finisterre and of the Scandinavian countries and Germany, and was made secretary of the French Geological Society. He took part in the fighting at Paris in February of 1848, and later in the year went to Milan, and held office in the War Ministry of the Provisional Government in Lombardy. Then he was Ambassador in Paris of Lombardy, Tuscany, and the Roman Republic in quick succession, but left the French capital after the capture of Rome; lived in Switzerland, and devoted himself to geology. He was Minister of War under Farini in Modena, but retired, and in 1860 joined Garibaldi's expedition to Sicily, and entered Naples with him. He was an Italian Deputy from 1860 to 1874, an extreme member of the Republican Party. He was a leader of the Italian Free Masons, and became Grand Master in 1869. In 1870 he again fought under Garibaldi.

FRAS, or **FRAZ**, JACOB. See VRAZ, STANKO.

FRASCATI, fräs-kä'tä. A beautiful summer resort in Central Italy, 985 feet above the sea, on the north slope of the Alban Mountains (q.v.), 15 miles southeast of Rome (Map: Italy, M 2).

It is the residence of a cardinal bishop, and has two churches that were mentioned in monastic records as early as the ninth century. In the Cathedral of San Pietro, dating from 1700, is a memorial tablet to Charles Edward Stuart, the Young Pretender of England, whose body, buried here in 1788, now lies in Saint Peter's. Famous estates are the Villa Conti; the Villa Piccolomini, where in the sixteenth century Cardinal Baronius wrote his *Annales*; the Villa Aldobrandini, built by Giacomo della Porta for Clement VIII.'s nephew, which contains paintings by the Cavaliere d'Arpino; and the sixteenth-century Villa Tusculana or Ruffinella, the property once of Lucien Bonaparte and afterwards of Victor Emmanuel II. Frascati first became important after the destruction of Tusculum (q.v.) in 191. Population of commune, in 1881, 7500; in 1901, 9915.

FRASER, ALEXANDER CAMPBELL (1819—). A Scottish philosopher. He was born in County Argyll, was educated in Edinburgh University, and from 1846 to 1856 was professor of logic in New College, Edinburgh. After contributing extensively to the *North British Review*, he became the editor in 1850, and held the position until 1857. In 1856 he succeeded Sir William Hamilton as professor of logic and metaphysics in the University of Edinburgh. Professor Fraser's philosophical work treats the three great problems—the material world, man, and God—in their mutual relations. The first is discussed in his *Collected Edition of the Works of Bishop Berkeley, with Annotations and Dissertations* (1871), and in a *Biography of Berkeley* (1880); the second in his *Annotated Edition of Locke's Essay on the Human Understanding, with Prolegomena Critical and Historical* (1894); and the three in his collected lectures on the *Philosophy of Theism* (1896) and his *Biography of Thomas Reid* (1898). He steers a middle course between extremes of agnosticism and idealism by a practical faith in the divine order of a universe incompletely interpretable.

FRASER, ALEXANDER MACKENZIE (1756-1809). A British general. He was educated at Aberdeen, and after a few years in the banking house of Forbes and Company, in Edinburgh, accepted (1778) a commission in the Seventy-third Highlanders. He served in the defense of Gibraltar, and as recruiting officer; and retired from the army in 1784, when he married Helen Mackenzie. In 1793 he was commissioned major in the Seventy-eighth Highlanders. He was sent to Guernsey, and in the following year to Flanders; covered Abercrombie's retreat, and distinguished himself in the sortie from Nimeguen and at Geldermalsen (1795). In 1796 he served at the Cape of Good Hope, and a year later went to India, where he campaigned against the Mahrattas. When he returned to England, he was elected to Parliament, and received the grade of major-general (1802). In the next year he inherited property from his aunt and mother, and took the name Fraser in addition to his own. After service in England, Hanover, and with Henry Edward Fox (q.v.) in Sicily, he was chosen by Fox to command an expedition to get control of Egypt; but fared very badly at Rosetta, after capturing Alexandria, and had to return to Sicily. Sent to Portugal (1808), he advanced with Moore into Spain; showed great military ability in the retreat

through Galicia and at Corunna; and was made lieutenant-general. In the following year he sickened while on the Walcheren expedition, and died soon after his return to England. He was popular as well as able.

FRASER, CHARLES (1782-1860). An American artist. He was born in Charleston, S. C. He practiced law for ten years to acquire the means of continuing his art, and eventually was very successful as a miniature painter. He painted Lafayette's portrait in 1825, and the portraits of many prominent citizens of South Carolina, and also produced some landscape and genre pictures. He wrote *Reminiscences of Charleston* (1854), and contributed to various periodicals.

FRASER, DONALD (1826-92). A Scottish minister, born at Inverness. He graduated at the University of Edinburgh in 1842, and after studying theology at Knox College, Toronto, and at New College, Edinburgh, held pastorates in Montreal, Inverness, and at the Marylebone Presbyterian Church, London (1870-1892). His works include: *Synoptical Lectures on the Books of the Holy Scriptures* (1871-76); *The Church of God and the Apostasy* (1881); *Life of Thomas Chalmers* (1881); *The Speeches of the Holy Apostles* (1882); *Seven Promises Expounded* (1885); and *Sound Doctrine* (1892).

FRASER, JAMES (1818-85). An English prelate, born at Prestbury, Gloucestershire. He was educated at Lincoln College, Oxford; from 1840 to 1860 was fellow of Oriel, where he was tutor in 1842-47 and sub-dean and librarian in 1844-47, and from 1847 to 1860 was rector of Cholderton, Wiltshire. In 1858 he received the appointment of assistant-commissioner to the Royal Commission on Education, and in that capacity made in 1859 a valuable report on the district assigned to him. He was rector of Upton Nervet, Berkshire, from 1860 until 1870, and greatly developed that parish; in 1865 visited the United States and Canada as a commissioner on education; rendered a second noteworthy report in the year following (*Report on the Common School Systems of the United States and of the Provinces of Upper and Lower Canada*, 1866); and in 1870 was consecrated Bishop of Manchester. His administration of this diocese, undertaken amid very grave difficulties and carried on with remarkable activity, resulted in the establishment of one hundred and nine new district parishes, the consecration of ninety-nine new churches, and the introduction of an admirable system of machinery for diocesan work. At the same time, his interests were so wide as to gain the esteem of all Nonconformists, including the Greek and Jewish congregations at Manchester, and to obtain for him the familiar title of "bishop of all denominations." Theologically he was of the old High Church school and opposed to the Tractarian movement. In his charities he was liberal. He published nothing beyond his reports as Parliamentary commissioner and a few addresses and sermons. A volume of his sermons, under the editorship of J. Doyle, appeared in 1888. Consult: *Memoir* by Hughes (1887); also Arnold, *Our Bishops and Deans*, vol. ii. (1875).

FRASER, MARY CRAWFORD (Mrs. HUGH). An English author, the daughter of Thomas Crawford the sculptor, and sister of Marion Crawford the novelist. She was born in Rome; was edu-

cated in England and in Rome; married Hugh Fraser, afterwards Minister to Japan; traveled with her husband in the two Americas and in the East; and was received into the Roman Catholic Church in 1884. Mrs. Fraser's finest literary work has been in interpreting the new Japan, the beauty of the land and the sense of beauty in its people. In 1899 she published an account of her observations in *A Diplomat's Wife in Japan* and five stories, called *The Customs of the Country, or Tales of New Japan*. With like sympathy and charm of style she has depicted Devonshire life in *A Chapter of Accidents* (1897), and modern Roman society in *The Splendid Porsenna* (1899).

FRASER, SIMON. See LOVAT, twelfth Lord.

FRASER, SIMON (c.1729-77). An English soldier. He was a subaltern officer in one of the two battalions of the Earl of Drumlanrig's regiment that had been in the Dutch service for some time previous to 1749, and in that year was pensioned upon the reduction of the two battalions to one. In 1757 he was appointed a captain-lieutenant in the Second Highland Battalion (later the Seventy-eighth Highlanders), and was soon after promoted to the rank of captain. He was present at the siege of Louisburg and at the action at Quebec. He afterwards served in Germany, at Gibraltar, and in Ireland, and rose to be lieutenant-colonel of the Twenty-fourth Foot. With the rank of brigadier for America, he accompanied Burgoyne in the pursuit of the American forces retreating from Fort Ticonderoga under the command of Saint Clair, and at Hubbardton (July 7, 1777) he won a complete victory over them. He participated also in the first battle of Saratoga (September 19), and in the second (October 7) was mortally wounded.

FRASER, THOMAS RICHARD (1841-). An English physician, born at Calcutta, and educated at the University of Edinburgh, where he graduated in medicine in 1862. He was assistant physician in the Royal Infirmary, Edinburgh (1869-74), a member of the Admiralty committee on Sir George Nares's Arctic expedition in 1876-77, and in 1877 became professor of materia medica at Edinburgh, and of clinical medicine in the year following. He was dean of the faculty of medicine from 1880 to 1900, and was president of the Indian Plague Commission. He became an authority on the action of poisons. His more important scientific writings include: *An Investigation Into Some Previously Undescribed Tetanic Symptoms Produced in Cold-blooded Animals* (1867-68); *An Experimental Research on the Antagonism Between the Action of Physostigma and Atropia* (1870); *The Character, Action, and Therapeutic Uses of Physostigma* (1883), a work which won him the Cameron Prize at the University of Edinburgh, and the Barbier Prize from the Academy of Sciences, Paris; and the *Dyspnoea of Bronchitis and Asthma* (1887).

FRASER, Sir WILLIAM (1816-98). A Scottish genealogist, born in Kincardineshire. He became deputy keeper of the records at Edinburgh in 1880. In this capacity he obtained access to the valuable material which enabled him to prepare his numerous genealogical works, which though somewhat dry in style are of high importance to the student of Scottish history. Fraser was distinguished for his numerous charities, and left more than £60,000 for educational and benevolent purposes. Among his rather vo-

luminous genealogies and histories may be mentioned: *History of the Carnegies, Earls of Southesk* (2 vols. 1867); *The Chiefs of Colquhoun and Their Country* (2 vols. 1869); *The Lennox* (2 vols. 1874); *The Douglass Book* (4 vols. 1885); and *The Elphinstone Family Book* (2 vols., 1897).

FRASER, Sir WILLIAM AUGUSTUS (1826-98). An English politician and author. He was born in 1826, the eldest son of Col. Sir James John Fraser, who fought at Waterloo, and was educated at Eton and at Christ Church, Oxford, graduating B.A. in 1849. Entering the army two years before receiving his degree, he rose to a captaincy in 1852, but resigned his commission and entered Parliament in the Conservative interest. He represented Barnstaple (1852 and 1857), Ludlow (1863), and Kidderminster (1874-80). In 1862 he was elected a fellow of the Society of Antiquaries, and subsequently was a member of the Queen's bodyguard for Scotland. Fraser became famous in London society for his stories and anecdotes concerning Wellington and Disraeli. He published: *Words on Wellington* (1889); *The Waterloo Ball* (1897); *Disraeli and His Day* (1891); *Hic et Ubique* (1893); and *Napoleon III.* (1896). He died in 1898. By his will he left a valuable collection of Gillray's caricatures to the House of Lords and a like collection of Doyle's caricatures to the House of Commons. His library was sold at auction for above £20,000.

FRA'SERA. A genus of North American plants of the order Gentianaceæ, named after John Fraser, an English botanist. The species are strong-growing, single-stemmed, usually biennial herbs, with thick bitter roots, opposite or whorled leaves, and bluish, white, or yellowish, generally spotted flowers in cymose clusters. They are rarely seen in cultivation.

FRA'SERBURGH. A seaport in Aberdeenshire, Scotland, on a branch of the Great Northern Railway, 42 miles north of Aberdeen (Map: Scotland, G 2). It is the chief seat of the Scotch herring fishery, and besides cured herrings and cod, exports oats, barley, meal, and potatoes. It has three tidal harbors, and its shipping includes 14 sailing vessels, 8 steam vessels, and a fleet of 700 fishing-boats. The town possesses a handsome cross, town hall, and spacious custom-house; the streets are wide and clean, with substantial dwellings. Its site is immediately south of Ptolemy's *Promontorium Texalium*, now Kinnaird Head, on which stands Fraser's ancient castle, utilized as a lighthouse, with its mysterious wine-tower and a cave beneath. Population, in 1891, 7466; in 1901, 9000, with a large increase during the fishing season in July and August.

FRASER RIVER. The principal stream of British Columbia, comprising in its basin of 138,000 square miles the greater part of the province (Map: British Columbia, E 4). The Fraser River proper has its origin in the union of two branches, the more important of which receives its waters from a series of lakes that lie in latitude 54° to 55° N., longitude about 124° 50' W., and flows in a general southeast direction for 260 miles, where it unites with the other branch, 200 miles long, which has its source near Mount Brown, in the Rocky Mountains. The point of confluence is near Fort George, and thence the Fraser River flows in a generally

southerly direction through nearly the whole length of the province, and, after a total course of 740 miles, empties into the Gulf of Georgia between Vancouver Island and the mainland, just north of the international boundary of 49° of latitude. Its chief affluents are the Stuart and the Chilcoten on the right, and the Thompson on the left. Between the Stuart and the Chilcoten, and on the same side, the Fraser River is joined by an affluent of historical interest—the West Road River—which took its name from its having been ascended by Sir Alexander MacKenzie on his adventurous journey of 1793 from the Hudson Bay territories to the Pacific Ocean. The Fraser River is navigable for small and powerful steamboats as far as Fort Hope, and at high water to Yale, 190 miles from its mouth, while to about half that distance—as far as New Westminster—it is navigable for large ships. Above Fort Hope the river sweeps through Big Cañon, which is traversed from Lytton downward by the Canadian Pacific Railway. From April to August the river is subject to floods, caused by the melting snow on the mountain ranges. In the narrow mountain valleys the river rises as much as 60 feet above its normal height, and in the lower valleys covers 150,000 to 200,000 acres of rich land. The Canadian Government has under consideration a comprehensive engineering plan of dams and dikes to mitigate this evil.

In 1857 the Fraser River, in its auriferous diggings and washings, began to stand forth as the rival of California and Australia. The discoveries, originally confined to the lower basins, have become more extensive and more productive, and eastward on the Thompson and northward among the upper waters of the great artery of the country the precious deposit has sometimes given almost fabulous returns. After 1862 washings and surface diggings were succeeded by systematic mining and steady labor. The Fraser River, its tributaries, and the numerous lakes communicating with them, furnish great facilities for the transport of timber. The lower Fraser country especially is densely wooded. The salmon of the Fraser River, of which there are five species, are justly famous, and the fishing and canning industries are of considerable importance. The river takes its name from Simon Fraser, who, in spite of the hostility of Indians and the natural difficulties to be overcome, explored it to its mouth in 1808.

FRASER RIVER SALMON. A species of salmon (*Oncorhynchus nerka*), called 'blueback,' 'redfish,' etc., which is the most common and valuable one in and near the Fraser River, B. C. See SALMON; REDFISH; PLATE OF SALMON.

FRA'SERVILLE, or RIVIÈRE DU LOUP, râ'vyar' du lœ (EN BAS). A town, summer resort and important railway centre of Temiscouata County, Quebec, Canada, picturesquely situated on elevated ground at the confluence of the Rivière du Loup with the Saint Lawrence, 125 miles north-east of Quebec (Map: Quebec, G 3). It is on the Intercolonial Railway, and is the terminus of the Temiscouata Railway. It has the Fraser Institute and other educational establishments, and carries on a considerable general trade. It is much frequented for its shooting, angling, boating, bathing, and its scenery. Population, principally French-Canadian, in 1891, 4175; in 1901, 4569.

FRASIER, frā'zhēr (OF., Fr., strawberry-plant, from *fraise*, strawberry, from Lat. *fragum*, strawberry-plant). In heraldry, a strawberry-flower appearing in the arms of the Scotch family of Fraser, as identical with a cinquefoil. See HERALDRY.

FRATERET'TO. One of the evil spirits by which Edgar pretends to be possessed during his mad scene in the third act of Shakespeare's *King Lear*. The name of this demon, as well as of some others in the same act, Shakespeare took from a book by Dr. Samuel Harsnet on *Popish Impostures*, published in 1603. In this Harsnet says: "Frateretto, Fleberdigibet, Hoberdinance, Tocobatto, were four devils of the round, or Morrice, whom Sara in her fits tuned together, in measure and sweet cadence. These four had forty assistants under them, as themselves do confess."

FRATERNAL INSURANCE. The characteristics which distinguish fraternal insurance from other forms are not to be sought in any peculiarity of the insurance itself, but rather in the nature of the body which grants it. There is no single feature of fraternal insurance which is not to be found in other systems of life insurance. Fraternal insurance is insurance granted by a 'fraternal beneficiary' society or order to its members. The essentials of such a society, as laid down by the National Fraternal Congress, are, that it should be organized in a system of lodges, that it should have a ritual and a representative form of government, that it should pay benefits, and should not conduct its business for profit. Such societies have almost invariably collected their premiums by means of assessments; but the assessment principle is not essential to their business, and on the other hand its use is by no means confined to such organizations. A great deal of undeserved odium has attached to fraternal insurance societies owing to the failure to discriminate between them and commercial assessment companies. The history of the latter is for the most part a record of inefficiency or dishonesty on the part of the managers and credulity on the part of the members, ending in a large proportion of cases in financial disaster.

HISTORY. The early American fraternal societies were established somewhat on the lines of the English friendly societies, several of which founded branches in the United States during the first half of the nineteenth century. Both the English and the early American societies paid benefits of various kinds, often including funeral benefits and payments to the survivors of the deceased members, but none of them established a system of payments deserving the name of life insurance. The first person in the United States to recognize the possibilities of developing on a large scale coöperative relief in the form of death benefits or life insurance through a system of affiliated lodges was John Gordon Upchurch, who founded in 1868 the Ancient Order of United Workmen. This society is still in existence and contained in 1902 420,000 members. Several other benefit societies, organized on the lodge system, were established during the next decade. Some of these introduced the insurance feature at once, led to it by the high rates charged by the old-line companies and the harsh provisions of their policies. A more powerful impetus toward the introduction of insurance into such societies came in the seventies,

when more than sixty legal-reserve old-line companies failed, creating a feeling of distrust and hostility toward them. Under the influence of this feeling fraternal societies already established introduced the insurance feature, new societies providing for it were formed, and non-fraternal assessment insurance companies appeared in large numbers. In the decade 1881-90, many additional fraternal insurance companies were organized. The eleventh census reported that on December 31, 1889, there were in the United States 298 such orders with 40,342 subordinate lodges. Owing to unsound financial methods, the term of life of many of these orders was very short, so that, in spite of the founding of many new orders, since 1890 there has probably been no increase in the total number in existence.

It is impossible to compile a complete list of existing fraternal insurance societies, or to collect full statistics about them, since in many States they are exempted from the duty of making reports to the Insurance Department. Many of the largest companies, however, are federated in the National Fraternal Congress, and for these companies it is possible to obtain complete statistics. In December, 1900, the congress included 47 orders, with 2,855,774 benefit members. The net gain in members for the year had been 327,513. The protection in force at the end of the year was \$4,585,579,982, and the net gain for the year \$401,952,932. It is probable that other orders not affiliated with the congress had approximately 1,000,000 members, with at least \$1,000,000,000 insurance in force. It is interesting to note that on the same date, December 31, 1900, the old-line life insurance companies reporting to the New York Insurance Department—companies which carried at least 95 per cent. of the life insurance in force in old-line companies in the United States—had policies in force amounting to \$4,076,283,539.

ORGANIZATION AND ACTIVITIES. The forms of organization of the fraternal orders are various. Their government is representative, and is vested in a supreme body consisting of an executive head and certain official associates. In some orders State lines are observed and State officers exercise immediate jurisdiction in many matters over the local lodges in the State. While nominally subordinate to the general body, they are more or less masters of the order in their own territory. Some orders have no intermediate State organization; the local associations are directly affiliated with the supreme body. The Ancient Order of United Workmen may be cited as an illustration of the former class, the Independent Order Sons of Benjamin of the latter. The activities of the different orders are also very various. It is unnecessary to speak of the social features which constitute so important a part of their life. These are entirely under the control of the local bodies, and manifest little approach to uniformity. In the matter of benefits also there is very great diversity. Some of the societies give only death benefits; others give benefits of many other kinds, such as disability, accident, sickness, burial, and monument benefits. These miscellaneous benefits are usually supported and managed by the local lodges. The death benefits, on the other hand, are usually under the control of the supreme national body; in a few orders they are maintained by the general State organization. Three federations of fra-

ternal beneficiary associations have been formed: the National Fraternal Congress, the American Fraternal Congress, and the Associated Fraternities of America. The National Fraternal Congress was formed at a meeting held in Washington in 1886, at which delegates from 17 orders were present. The orders represented at the congress of 1901 numbered 47. In the constitution the objects of the congress are "declared to be the uniting permanently of all legitimate fraternal benefit societies for the purposes of mutual information, benefit, and protection." In recent years it has devoted a large part of its time and energy to the attempt to accomplish two objects. The first is the voluntary increase of assessment rates by the affiliated orders for the purpose of accumulating reserves, or, as they prefer to call them, emergency funds; the second is the securing of uniform legislation by the various States on matters affecting fraternal insurance. Some of the specific measures advocated by them will be referred to later on.

The American Fraternal Congress was organized at Omaha, Neb., in 1898, by representatives of 18 fraternal orders. The purpose of this organization was to work for the establishment of reserve funds by the fraternal societies. No society without a reserve fund was eligible to membership. The National Fraternal Congress has done so much work along the same line that the more recent federation has little occasion to act and has not become very prominent. The Associated Fraternities of America was organized at Chicago in 1901 by representatives of the younger fraternal orders in opposition to the National Fraternal Congress. Forty-two societies were represented at the meeting. The first annual meeting was held in July, 1901, 24 associations being represented. The point of conflict between the two organizations will become apparent on considering the nature of the legislation sought by the National Fraternal Congress. It is in brief the enactment of a minimum assessment rate for all fraternal insurance organizations. The purpose is to prevent the appearance of new companies with low assessment rates to draw away the 'new blood' from the old established companies, in which the advancing death-rate has made necessary an increase in assessments in order to pay losses. Such legislation the younger orders naturally resist.

TECHNIQUE. Assessment insurance was organized largely in protest against the methods of the old-line life insurance companies. It was generally believed that the cost of insurance in those companies was unnecessarily high. A reduction in cost was anticipated from two sources. In the first place, it was proposed to reduce the expense of management to a minimum, and in this way to cut down the heavy 'loading' which the old-line companies added to the natural premium. In the second place, it was proposed to do away with the enormous surpluses which the old-line companies were held to be continually accumulating and never paying out. "Pay your losses as they occur and keep your reserve in your own pockets," was the maxim of the advocates of the assessment principle. No financial craze recorded in history has affected more people, or people with sounder judgment in ordinary business matters, than did the assessment craze. Its culmination was reached in the establishment of a large number of assessment endow-

ment societies, which guaranteed to every member a certain stipulated sum at the end of a fixed period of time in return for a number of periodical payments to the company. The Iron Hall was the first and most notorious of these associations. This organization virtually promised its members that in consideration of the annual payment to the society for seven years of 18 assessments of \$2.50 each, making a total contribution of \$315, each member should receive from the society \$1000 at the end of the seven years. For a few years such payments were actually made, the endowment of the early members coming out of the contributions of the new members. Only by a steady increase of membership at a continually increasing geometrical ratio could such a system be maintained. The Iron Hall and all its imitators came to grief within a few years, bringing loss upon millions of people in the United States.

The assessment life-insurance companies were managed on no sounder principles than the assessment endowment societies. At the beginning all of them, whether fraternal or non-fraternal, raised their funds by assessments after the death for which indemnity was to be paid. In the early days of an assessment company, while the average age of the members was low and the benefit of medical selection was still felt, these assessments were very small. Knowledge of the scientific principles of life insurance was not to be found among the promoters of these companies. The need of mortality tables and the desirability of accumulating a surplus during the earlier years to prepare for increasing mortality were both denied. It was the general claim that the continual accession of new members would prevent any advance in the average age of the members or in the death-rate. This might have been the case if a company had been started with a membership whose age distribution was properly related to a sound mortality table. It could not possibly be the case in a company which started, as all these companies did start, with a great preponderance of young members. In such a company it is clear on *a priori* grounds that the average age of members must increase. Experience soon demonstrated the same fact. The average age of members and the death-rate increased, and the inevitable increase in the rate of assessment kept new members out of the society, and on the other hand the lapse rate continually advanced, through the withdrawal of members who were unwilling to pay the increased assessments, or desired to join new societies in which the average age, death-rate, and assessments were still low. The vast majority of non-fraternal assessment societies and a large number of fraternal associations were in this way forced out of business.

The greatest enemies of an old established fraternal insurance society are unreasonable expectation created by unjustifiably low rates at the beginning, and new companies with low mortality and small assessments. Realizing this fact, the old societies which are federated in the National Fraternal Congress have adopted two lines of action to protect themselves. In the first place, they have undertaken a campaign of education among their own members. Year after year they analyze the returns of the constituent orders, and point out the inevitable advance from year to year in average age, in death-rate, and in cost

of insurance, as well as the tendency of the members to desert the old companies and flock to the new. A comparison of the average annual death-rate in different years for the entire congress has no significance, since old companies with a high death-rate are continually passing away and new companies with low death-rates coming in. At the meeting of the congress in 1899 the report of the committee on statistics pointed out that while the average death-rate for the whole body was 8.65 per 1000 in 1898, as compared with 9.32 in 1897, if allowance was made for the influence of the new orders in lowering the rate (it was impossible to make allowance for the similar effect of the withdrawal of the older orders), the figures would be 8.87 in 1897 and 8.89 in 1898. The committee also compiled the death-rates for 21 companies for each of ten years. In 1888 the average had been 7.22, in 1893 9.34, and in 1898 10.84. As to the effect of these changes upon membership it was shown that of the 46 orders reporting that year 19 had a death-rate above the average for the group, and 27 a rate below the average; that the 19, with a membership at the beginning of the year of 869,862, had made a net gain during the year of only 2415; and that the 27, with a membership at the beginning of the year of 1,192,811, showed a net gain of 217,282. The rate of gain in the former group was 0.28 per cent., and in the latter 18.26 per cent.

In a similar way the committee demonstrated that average age and cost of insurance both increase as the society grows older. Thoroughly aroused by such revelations, the congress authorized the appointment of a committee to prepare tables of rates by applying to a proper extent the principles of a reserve or an emergency fund. This committee first prepared a new mortality table, after investigation which convinced it that the tables of mortality in use by the old-line companies were higher than experience justified. The divergence between the old tables and the new ones is brought out by the following comparison of the death-rate per 1000 living at different ages:

AGE	American experience table	Fraternal table	AGE	American experience table	Fraternal table
20	7.81	5.00	60	26.69	22.75
25	8.07	5.20	65	40.13	34.40
30	8.43	5.55	70	61.99	53.65
35	8.95	6.15	75	94.37	85.48
40	9.79	7.17	80	144.47	138.10
45	11.16	8.88	85	235.55	225.10
50	13.78	11.45	90	454.55	368.95
55	18.57	15.71	95	1000.00	606.78

While the mortality experience of every old-line life-insurance company which exercises due care in the selection of its risks shows a rate of loss below that indicated by the American Experience Table, the degree of difference between the two tables here outlined gives reason to think that the Fraternal Table is very close to the margin of safety. At the same time it is a great advance over no table at all, and experience will soon test its validity.

On the basis of the new mortality table, and on the assumption that the reserve will earn four per cent. interest, the committee prepared several tables of minimum rates. Besides the level annual rate, such as is commonly used by old-line companies for whole-life policies, the com-

mittee prepared a table of rates peculiar to the fraternal and assessment societies, the so-called step rate. The step rate advances with advancing age, but not from year to year as the natural premium rate does, but at stated intervals, usually every five years. By a modification of the step-rate plan a slight addition is made to the premium rate during the earlier years, in order to make possible a reduction of the rate in old age. All the rates prepared by the committee presuppose the abandonment of the system of assessing after the occurrence of the loss and the accumulation of a surplus at least for one year. The congress has urged its members to adopt as minimum rates those prepared by the committee, with such loaning for expenses as each association finds necessary. Some organizations have done this, but the extent to which changes have been introduced is very unequal. The result is a high degree of diversity of rates. At the National Congress for 1899 there was exhibited a table of rates actually charged for the same kind of insurance at the same age in different fraternal societies. At age fifty, for example, no less than 41 rates for the same protection were in force in different companies, varying by moderate differences from a minimum of 65 cents to a maximum of \$3.80.

Despairing of its ability to secure the adoption of the new rates through the voluntary action of the orders, and dreading the effect of the competition of new orders with low rates, the congress has begun the attempt to secure the adoption of these rates through legislation. In the session held in 1901, the president reported that legislation requiring the establishment of these minimum rates as conditions of doing business in the State had been secured in five States, viz. North Dakota, Tennessee, Washington, Vermont, and Indiana. Similar legislation will doubtless be secured soon in other States. Whether the low rates thus established will be found high enough to maintain the companies permanently in a sound financial position it is impossible to say.

Rates in the fraternal companies can be legitimately kept below rates in the regular companies in only two ways: either by making such a selection of lives that the rate of mortality is lower in the former than in the latter, or by keeping expenses of management below those of the old-line companies. To a greater or less extent both these aims are accomplished. There can be no doubt that the close personal scrutiny which every individual undergoes before being admitted to a lodge is a valuable supplement to the medical examination. If it is found that the mortality schedule adopted is sufficiently high, rates may legitimately be put below the old-line level. Moreover, the expense of management in the fraternal is reduced to a minimum. Not to speak of the large amount of gratuitous service rendered by the members of many associations, the entire absence of agents for soliciting business is a source of great economy to the companies. The amount paid agents by the old-line companies is approximately one-third of the amount paid to policy-holders. It is clear, therefore, that there are great opportunities for economy by the fraternal companies, and it may fairly be expected that those among them which take to heart the lessons of experience and put their business on a sound basis so far as the matter of surplus is concerned, will continue their

usefulness indefinitely, furnishing insurance in comparatively small amounts at low rates to those most in need of it and least able to pay for it at high rates.

FRATERNITIES (Lat. *fraternitas*, brotherhood, from *fraternus*, brotherly, from *frater*, brother; connected with Gk. *φράτηρ*, *phratēr*, clansman, OChurch Slav. *bratrŭ*, OPruss. *bratis*, Lith. *brŭlis*, Ir., Gael. *brathair*, Corn. *bredar*, Skt. *bhrātar*, Goth. *brōþar*, OHG. *bruodar*, Ger. *Bruder*, AS. *brōþor*, Eng. *brother*), **AMERICAN COLLEGE**. Societies of students found in nearly all the colleges and universities of the United States. In general they are secret in character; but this secrecy is largely nominal, consisting chiefly of extreme care in protecting their constitutions and mottoes from outside knowledge, and in holding secret meetings. Aside from this they do not cultivate mystery in their methods or work. The fraternities are composed of branches called 'chapters,' situated in the various colleges. But no fraternity has more than one chapter in any one college. Usually the students of all collegiate departments are eligible to membership, though the academic department has uniformly furnished the largest part of fraternity membership. Fraternities are variously termed by outsiders, 'Greek-Letter Fraternities,' and 'College Secret Societies,' but among themselves the term 'Fraternities' is universally used.

NOMENCLATURE. The Greek alphabet is generally employed to name both the fraternity and the chapter. Usually a Greek letter is assigned to a chapter according to the order of its establishment; but in some fraternities the name of the State may be added, and infrequently the chapter takes its name from the college or town in which it is placed. An extremely rare instance is known of one chapter, which is named after a prominent individual. When chapters have used all the letters of the alphabet, it is customary to start anew, and add the word 'deuteron' to the letter, thus signifying second. The badges of the fraternities are of three types. One is a plate of gold, which displays the fraternity name and one or more symbols of special significance. A second form is a monogram of the letters of the fraternity, while the third is a symbol, as a key, a skull, or a scroll.

ORIGIN, ETC. The first Greek-letter society, Phi Beta Kappa, was organized at the College of William and Mary in 1776. "The promotion of literature and of friendly intercourse among scholars" was its given *raison d'être*. Its origin is legendary. Three stories of its birth have been handed down by tradition. One gives Thomas Jefferson the honor of founder, one asserts that it sprang from a lodge of Free Masons, the third claims that it was brought from Europe. The first meeting was held in the Apollo room of the old Raleigh Tavern at Williamsburg, Va., a spot made famous by the historic speech of Patrick Henry. In December, 1779, branches were authorized at Yale and Harvard, and in 1780 the meetings of the parent chapter ended amid the vicissitudes of the Revolution, then raging in the immediate vicinity of Williamsburg. The Yale chapter was established in 1780, and that at Harvard in 1781. In 1787 these two chapters united to found a chapter at Dartmouth College. In 1831 the Harvard chapter gave up its individual secrets, and in that year its motto, 'Philosophy, the Guide of

Life,' became public. Since 1831 a purely honorary status has existed, and membership is gained only by high scholarship, and given only to honor men usually of graduating classes. (See PHI BETA KAPPA.) In Yale in 1821 a literary society was founded, called the Chi Delta Theta. Many other literary societies existed at about the same time, in which might be mastered the art of debate, and in which oratory might be indulged in before an audience of college mates. These literary societies served no mean part in college life, and they had faculty approbation and encouragement; but their literary contests and election rivalries destroyed any deep fraternal interest in them. The fraternity system, as it exists to-day, originated at Union College in 1825, when the Kappa Alpha, the first of men's general fraternities, was established. Externally it imitated the Phi Beta Kappa in its secrecy, in its Greek title, and in its limitation of membership to upper-class men. The start of the fraternity system was very simple. But its novelty was so marked that it at once aroused opposition on the part of the faculty. That attitude has now, however, almost entirely changed. Antagonistic legislation has been greatly modified or else abandoned. Faculty and students dwell in amity, and through the medium of the chapter houses entertain and meet socially their instructors. Ex-President White, of Cornell, President Andrews, of Nebraska University, and other leading educators both East and West, have given public expression to their belief in the utility and value of the college fraternity system. In 1827 we find the Sigma Phi and the Delta Phi established at Union. The system was now well launched, but at one institution alone. In 1831 the Sigma Phi placed the first chapter of any fraternity (omitting Φ B K, now become an honor society) at Hamilton College; and this move probably led to the foundation of Alpha Delta Phi at Hamilton as a competitor in 1832. Alpha Delta Phi started a chapter at Miami University in 1835. Prior to this expansion the fraternity system was confined to two States, New York and Massachusetts, and to the three colleges, Union, Hamilton, and Williams. At Miami in 1839 another fraternity, the Beta Theta Pi, was founded. Before 1839 Union College saw one more fraternity established, the Psi Upsilon, in 1833. At Williams was founded the Delta Upsilon in 1834. The year 1840, thirteen years after the foundation of Kappa Alpha, marks the time when the system could be clearly termed national. Since that period the system has spread, the establishment of fraternities and chapters becoming more frequent until, in 1898, the last year in which a statistical canvass was made, there were approximately 800 chapters in existence. One society, the Delta Upsilon, was in its foundation at least entirely anti-secret. The advent of the fraternity system hurt the prestige of the literary societies through competition for membership and in other ways, and on that account four literary societies met in convention in 1847, and formed the 'Anti-Secret Confederation.' In 1858 a fraternity was effected out of this confederation, changing its status and adopting the monogram badge of Delta Upsilon. In time Delta Upsilon became only nominally non-secret, to-day ranking practically with other secret fraternities. It is believed that no other non-secret fraternity could be successfully started.

WOMEN'S FRATERNITIES. The women's fraternities followed naturally upon the general opening of colleges to co-education, and as young women came to participate more and more in college life, to live in dormitories, and take up college residence. The first of these sororities (as these fraternities are called) was the Kappa Alpha Theta, founded at De Pauw University in 1870. The second, Kappa Kappa Gamma, was founded at Monmouth College in the same year. The Delta Gamma started at the University of Mississippi in 1872, and the Alpha Phi was also installed in 1872 at Syracuse University. The Gamma Phi Beta was launched at Syracuse University in 1874. The Delta Delta Delta was organized at Boston University in 1888, and the Pi Beta Phi (originally I C Sorosis) was founded at Monmouth College in 1867. These societies are practically identical in aims and purposes with the men's fraternities, and in colleges where houses are owned by sororities their general similarity as part of the college organization is marked. It is but thirty-two years since the first sorority was founded. To-day the alumni interest is very strong, and has taken material expression in homes for the sororities at various colleges and universities.

LOCAL FRATERNITIES. Local fraternities are many and important. Those at Yale University have become the most widely known. They are senior societies, and are three in number: Skull and Bones (1832), Scroll and Key (1841), Wolf's Head (1884). They always elect fifteen men in each year, have no electioneering or pledging, but offer their elections on the campus on a certain date of each year in an impressive manner in the presence of the student body. The system is peculiar, and exists at no other college.

ORGANIZATION, ETC. Prior to 1861, the government of a fraternity was usually retained as a heritage by one chapter, but was modified at times by the several chapters assembled in convention. The year 1870 is generally accepted as the date of a solidified system. After the Civil War the fraternities which had suffered through the enlistment of their members—and in some cases a whole chapter would be enlisted—recovered activity, and widened their organizations. Then a better government was effected, the governing powers becoming well centralized and stable. In general, the legislative power of fraternities has been vested in an annual convention of delegates, while the administration has been placed upon a few officers there elected.

Social life forms the basic *raison d'être* of all fraternities. They seek as members those who promise to contribute most to a fellowship where social equality, good scholarship, athletic abilities, and mutual helpfulness are sure to be maintained.

Naturally the contest for members is intense. In general this campaign is the great student feature of the beginning of each college year. Entrance to the fraternity is gained by an initiation, which is widely announced among the members, and usually attracts a large alumni attendance. The chapter house is the most notable part of fraternity life. Statistics show that there were in 1883 but 33 houses owned and occupied by the general fraternities. In 1890 there were 70 such houses. But in 1898 425 houses were owned or occupied by the national, local, and women's fraternities of the United

States. Of these 134 were owned by the men's fraternities, and 3 owned by the sororities. This great increase is instructive, illustrating the growth of fraternities in a single decade.

The control of the chapter house is vested in a corporation of alumni, but generally subject to the immediate management of the students.

Fraternity members are styled 'active' when in actual college attendance; 'alumni' afterwards. Should they be elected while not undergraduates, they are termed honorary members. To bestow honorary membership is, however, at the present time generally discountenanced. For a member to belong to two fraternities at any one college, or to two at different times in different colleges, is reprehensible and forbidden. Most fraternities publish catalogues, song-books, and magazines. Each fraternity deems a catalogue a necessity. In early days these were mere lists of membership, but now they generally contain addresses of members, the rolls of chapters, and tables of varied statistics, including an important table showing the geographical distribution of chapters and members. Histories have been issued by a few of the fraternities. The song-books have special music in addition to usual college songs, with words written by members. The periodicals are an important factor in the fraternity life. Periodicals are now published by Alpha Tau Omega, Alpha Chi Rho, Beta Theta Pi, Chi Psi, Delta Kappa Epsilon, Delta Tau Delta, Delta Upsilon, Kappa Alpha, Kappa Sigma, Phi Delta Theta, Phi Gamma Delta, Phi Kappa Psi, Phi Kappa Sigma, Sigma Alpha Epsilon, Sigma Chi, Sigma Nu, Theta Delta Chi. The following women's fraternities publish periodicals: Alpha Chi Omega, Alpha Phi, Chi Omega, Delta Delta Delta, Delta Gamma, Kappa Alpha Theta, Kappa Kappa Gamma, Pi Beta Phi.

The legal status of fraternities has in several cases been in litigation. In one case, hinging upon the right of a college faculty to debar a student because of his fraternity membership, the Supreme Court of Indiana (1881) decided: "There is no doubt whatever that if an applicant for admission into a public college is otherwise qualified, and there is room to receive him, he cannot be denied admission by reason of membership in a college fraternity." And the Court held further that the requiring by the faculty of a written pledge from the student that he would not join a fraternity, as a condition precedent to his matriculation, implied discrimination against a class of inhabitants of the State. On the other hand, it appears to be established that a privately endowed and managed college may exact and enforce such a pledge. In May, 1901, the Arkansas Legislature enacted a law "to prohibit the organization of (and membership in) secret societies in the University of Arkansas, and for other purposes." The legality of this law is to be tested in the courts. One of the most important cases that has been recently decided, at least from a theoretical point of view, and involving the internal organization and powers of a fraternity, was that of the Kappa Kappa Gamma Society versus certain members of its Grand Council. The Grand Council had endeavored to withdraw, without its consent, its Beta Beta chapter, and suits to restrain the Council, through the individual members thereof, were instituted in New York and Massachusetts. The Massachusetts court dismissed the suit on the ground that no property

right was involved; but the New York courts held, on appeal, among other things, that the publication of *fraternity suits* by the Beta Beta chapter had been proper, inasmuch as the fraternity had virtually compelled it; that rights were affected for which a court of equity could give remedy, and that the fraternity should, on the facts presented, be restrained from withdrawing its chapter. Consult: Baird, *American College Fraternities* (New York, 1898); Kellogg, *College Secret Societies* (Chicago, 1874); Aiken, *The Secret Society System* (New Haven, 1882); Emerson, *The College Year-Book and Athletic Record* (New York, 1897); Maxwell, *Greek Letter Men of New York* (New York, 1899); Randolph, "Greek Letter Societies in American Colleges," in *New England Magazine*, vol. xvii.; "White Fraternities," in *Forum*, vol. iii. For college societies which are not, strictly speaking, fraternities, see SOCIETIES; COLLEGES, AMERICAN.

FRATICELLIANS, or **FRATICELLI**, frä-tichél'lē (It., ML. *fraticelli*, little brethren, diminutive of Lat. *frater*, brother). A name applied to various more or less strictly defined heretical sects of the Middle Ages, not closely connected either by their beliefs and tendencies or by their time. Their general tendency was one of protest against the existing ecclesiastical and social order, and there is little to distinguish them, to the modern mind, from the Albigenses, Waldenses, Catharini, Beghards, and Brethren of the Free Spirit. The name is found as early as the beginning of the fourteenth century, for example in the chronicle of Giovanni Villani. The origin of the Fraticelli proper has often been connected with the Franciscan Order, or with a particularly strict and rigorist party within it. This theory is supported by the fact that this name was common in Italy to designate the Friars Minor; but it seems much more likely that, as the immense popularity of the Franciscan Order produced a multitude of unauthorized imitations of it, these innovations in doctrine found ready acceptance in such groups, unrestrained as they were by any close oversight of ecclesiastical authority. As a sect, their origin may, with the greatest probability, be traced to Gherardo Segarelli, a laboring man of Parma, and his disciple, Dolcino of Novara, who organized their followers as an 'apostolic Order,' and made considerable noise in Upper Italy from 1260 to 1307. They declared poverty an absolutely essential condition of belonging to the true Church, and regarded the existing Church as in a state of apostasy. They had no fixed domiciles, but wandered from place to place. They were not bound by any definite rule, and under Dolcino at least, their career was marked by the 'free-love' excesses which have formed part of the history of later Anabaptist and communistic associations. The adherents of Segarelli and Dolcino held that all authority was forfeited by sin, and proceeded to fill all the offices which, on their hypothesis, were vacant, electing a certain Majoretto Emperor, a secular priest named Rainaldo Pope, and choosing archbishops of Florence and Venice and a general of the Franciscans who did not even belong to the Order. They were gradually suppressed in the course of the first half of the fifteenth century; John Capistrano was commissioned as inquisitor-general in their regard by Martin V., Eugenius

IV., and Nicholas V., and succeeded in completing their eradication. Their last pseudo-pope was burned at Fabriano in 1449, and the sect disappears from history with him. For the sake of clearness, it would be well to restrict the name Fraticelli to the sect above described; but it is sometimes given to the rigorist Franciscans, and to the followers of Michael of Cesena. Consult: Döllinger, *Beiträge zur Sekten-geschichte des Mittelalters* (Munich, 1890); Lea, *History of the Inquisition* (London, 1894); and see FRANCISCANS.

FRATTAMAGGIORE, frät'tá-má-jó'rá. A city in South Italy, 8 miles north of Naples, with silk and rope factories and numerous country houses of rich Neapolitans (Map: Italy, D 10). Population, commune, in 1881, 11,000; in 1901, 13,170.

FRAUD. In its broadest sense, any variety of falsehood and artifice by which one deceives another to his legal injury. Courts have been cautious about defining this term, fearing that any precise and complete definition would tend to help crafty and dishonest persons in their attempts to evade the law, and would embarrass the courts themselves, when called upon to deal with new forms of fraud. In the courts of common law the term has borne a narrower and more exact signification than in courts of equity. We will deal with these significations separately.

At law, fraud is a false representation of some matter of fact, intended to deceive another and actually deceiving him to his legal injury. All of these elements must concur. There must be a false representation of fact as distinguished from an expression of opinion. A person who induces another to buy a horse for three hundred dollars, by falsely asserting that it is worth that sum when he knows it is worth but a hundred dollars, acts dishonorably, but does not render himself liable to an action for fraud. He has expressed an opinion, not asserted a matter of fact. Had he declared that the horse could trot a mile in three minutes, or was of a certain strain of blood, or was sound, he would have asserted a fact, which the other party would have had a legal right to rely on. It is to be borne in mind that a false representation may be made by conduct as well as by words; as when a manufacturer skillfully conceals a defect in an article. Simple non-disclosure of the truth, however, does not amount to fraud, for fraud involves the idea of active misconduct. If, however, a party makes a statement which is true as far as it goes, but because of his non-disclosure of other facts the statement conveys a misleading impression and deceives the other party, we have a case of fraudulent concealment.

Not only must the representation be one of fact, but the one making it must know it to be false; or he must make it in reckless disregard of its truth. In other words, there must be a dishonest intention to deceive. Mere negligence in asserting as a fact that which turns out to be false is not fraud, although it may subject the negligent actor to some other liability. Such, at least, is the doctrine which now prevails in England and in most of our States. The third element in an actionable fraud is the deception of the injured party. A manufacturer may patch up a defective article, intending to deceive a purchaser by such concealment of the defect. Still

if a person buys the article without question or examination, his purchase cannot be said to have been induced by the fraudulent conduct of the manufacturer. He was not deceived. He was simply careless.

While the one who complains of a false representation must show that he was actually deceived by it, he need not show that it was the sole or predominant motive to action. It is enough that it materially affected his decision; that it induced him to act as he would not have acted had it not been made. Finally, the deception must result in legal injury to a person, or he cannot insist that he has been defrauded. The law does not give redress for a naked lie. It leaves the punishment of that to another forum.

The legal effect of a fraud is to render every contract or transaction in which it is a material element voidable at the option of the defrauded party. One who has been defrauded into buying and paying for property has the right to rescind the contract, tender back the property, and recover the price. If one has been induced by fraud to sell property on credit, he may retake the property. Rescission is not the only right of the defrauded party, however. He may maintain an action for damages against the wrongdoer.

In EQUITY. Courts of equity have been accustomed to characterize such fraud as we have been considering as actual fraud, while they designate active misconduct as 'constructive fraud,' or 'conduct amounting to fraud in the contemplation of a court of equity,' or 'fraudulent in the eyes of this court.' Most of the acts falling within these categories, however, are distinguishable from fraud, in its proper sense; and courts of equity relieve against them, not because they have actually deceived their victim, but because they are repugnant to sound public policy, or because they fall under the head of *undue influence* (q.v.). In the language of Hardwicke, "Fraud does not here mean deceit or circumvention; it means an unconscientious use of the power arising out of certain circumstances and conditions; and when the relative position of the parties is such as *prima facie* to raise the presumption of undue influence by one over the other," the transaction cannot stand, unless the person claiming the benefit of it is able to repel the presumption by contrary evidence, proving it to have been, in point of fact, fair, just, and reasonable." Consult the authorities referred to under CONTRACT; TORT; and also Bigelow, *The Law of Fraud on its Evil Side* (Boston, 1888); Kerr, *Treatise on the Law of Fraud and Mistake* (4th ed., London, 1902).

FRAUDS, STATUTE OF. A statute originally passed in the year 1676 (ch. 3 of 29 Charles II.), and taking its name from its purpose, as expressed in the preamble—"the prevention of many fraudulent practices which are commonly endeavored to be upheld by perjury and subornation of perjury." This purpose the framers of the law thought could be accomplished by requiring written evidence, or certain formal acts of the parties, as proof of the more important business transactions. The statutes contain twenty-five sections, the most important of which may be classified as follows: The first three specify the manner in which interests in land may be created or assigned. The fourth describes the evidence requisite to establish certain agreements. The fifth and sixth, as well as sections

nineteen to twenty-two inclusive, regulate the execution and proof of wills. Sections seven to ten inclusive relate to trusts in lands. The seventeenth section applies to sales of personal property.

Opinions concerning the policy and the consequences of this statute have differed widely. It has received unstinted praise from judges and writers of great reputation, while it has been unmercifully criticised by others equally eminent. Chancellor Kent approved the view that every line of it was worth a subsidy, and declared that it would be hazardous to attempt to recast the statute in new language, or to disturb the order and style of its composition. On the other hand, Chief Justice Erle of England asserted that although the statute had been very much praised, he believed "that the party who inserted the words had no idea what he meant by 'acceptance'"; "that opinion," he added, "I found on the everlasting discussion which has gone on." Mr. Justice Stephen repeatedly characterized the seventeenth section as a nuisance, declaring that it "sins against several of what ought to be the well-recognized rules of national legislation." Notwithstanding the severe criticisms to which the statute has been subjected, most of its provisions have been reenacted by our State legislatures. Some of these have undoubtedly proved very beneficial, especially those relating to wills and to conveyances of interests in land. This is admitted even by Mr. Justice Stephen. The sections which have proved most fruitful of expensive and dishonorable litigation are the fourth and seventeenth, which are as follows: "That no action shall be brought (1) whereby to charge any executor or administrator upon any special promise to answer damages out of his own estate; (2) or whereby to charge the defendant upon any special promise to answer for the debt, default, or miscarriage of another person; (3) or to charge any person upon any agreement made upon consideration of marriage; (4) or upon any contract or sale of lands, tenements, or hereditaments or any interest in or concerning them; (5) or upon any agreement that is not to be performed within the space of one year from the making thereof, unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized." "That no contract for the sale of any goods, wares, and merchandises, for the price of ten pounds sterling or upward, shall be allowed to be good, except the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the bargain, or in part payment, or that some note or memorandum in writing of the said bargain be made and signed by the parties to be charged by such contract, or their agents thereunto lawfully authorized." The latter of these sections has been discarded in sixteen of our States, viz. Alabama, Arizona, Delaware, Illinois, Kansas, Kentucky, Louisiana, New Mexico, North Carolina, Ohio, Pennsylvania, Rhode Island, Tennessee, Texas, Virginia, and West Virginia. In the others it has been reenacted, although with various modifications of language.

It is to be noted that the English statute does not declare contracts void which are not entered into, or evidenced, as required by its provisions.

VOL. VIII. — 14.

"No action shall be brought," or "No contract shall be allowed to be good," is the language of the act. In some of them has been substituted for these expressions such language as this: "Every contract . . . shall be void," or "the agreement is invalid," unless the statutory requirements are complied with. Even in such States, however, the courts have generally construed the statute as it has been construed in England, not to render compliance with its provisions essential to the validity of the enumerated contracts, but only necessary to the proof of such contracts against the party who sets up the statute as a defense. For the application of this statute to particular topics, see the articles CONTRACT; EXECUTION; GUARANTY; INDEMNITY; LEASE; MARRIAGE; PRINCIPAL AND SURETY; SALE; SPECIFIC PERFORMANCE; TRUST; WILL. Consult: 1 *Law Quarterly Review*, p. 1; 5 *Encyclopædia of the Laws of England*; Browne, *Treatise on the Construction of the Statute of Frauds* (5th ed., Boston, 1895).

FRAUDULENT CONVEYANCE. A transfer of property in fraud of creditors or purchasers. It is undoubtedly voidable at common law by the party defrauded, but for more than three centuries it has also been under the ban of statutes known as 13 Eliz., c. 5 (1571), and 27 Eliz., c. 4 (1585). Although these enactments are generally accounted a part of 'the common law which accompanied the emigration of our ancestors' to this country, their provisions have been reenacted in most of our States. The first of these English statutes, after reciting "that feoffments, gifts, grants, alienations, conveyances, bonds, suits, judgments, and executions have been contrived of malice, fraud, covin, collusion, or guile, to delay, hinder or defraud creditors or others of their just and lawful actions, suits, debts, accounts, damages, forfeitures, etc.," proceeds to declare that every such transfer or incumbrance of real or personal property shall be utterly void "as against that person, his heirs, successors, executors, administrators, or assignees, whose actions, etc., are or might be in any wise disturbed, delayed, hindered or defrauded by such practices"; unless such transfer or incumbrance was made upon a good consideration and *bona fide* to one not having notice of the fraud.

This statute includes every kind of property which creditors of a transferor have a legal right to seize and sell in satisfaction of their claims. It is not necessary that the transferor be guilty of actual fraud. He may believe that it is his moral duty to give the property in question to the transferee, but if such gift leaves him insolvent—unable to pay his lawful debts—its necessary consequence is to hinder and delay his creditors; to take from them property which the law permits them to claim, and divert it to the use of others who have no such right. Such conduct is properly characterized as fraudulent, for it is a breach of the legal duty 'to be just before one is generous.' The statute does not apply to property which is exempt from creditors' claims; nor does it confer any benefit upon creditors who become such after the conveyance is made. A transfer of property may be set aside, however, by subsequent creditors if it was made with actual attempt to defraud them.

The second statute above named to refers only to purchasers of lands—avoiding all conveyances

of real estate interests "made for the intent to defraud and deceive such persons as shall purchase the same lands." In England it is held that a voluntary conveyance of real estate, even for a meritorious purpose, such as providing for wife and children, is within the policy of the statute, and may be set aside by any subsequent purchaser for value, although he buys with notice of such conveyance. In this country, however, the doctrine is limited to purchasers for value and without notice.

Conveyances of the character under consideration are not absolutely void; they are only voidable. As between the parties to the transaction they are binding. Even when impeached by creditors and purchasers, they are set aside only to the extent necessary to give effect to the rights of complainants.

Consult: May, *Treatise on the Statutes of Elizabeth Against Fraudulent Conveyances* (2d ed., London and Philadelphia, 1887); Bump, *Treatise Upon Conveyances Made by Debtors to Defraud Creditors* (4th ed., Washington, 1896); Wait, *Treatise on Fraudulent Conveyances* (3d ed., New York, 1897); Hunt, *The Law Relating to Fraudulent Conveyances* (London, 1897).

FRAUENBURG, frau'en-böörk. A town in the Government-District of Königsberg, Prussia, 41 miles southwest of Königsberg (Map: Germany, J 1). Copernicus was once Canon of Frauenburg, and died there. The fine Gothic cathedral contains his tomb. Population, in 1900, 2492.

FRAUENFELD, frau'en-fält. The capital of the Canton of Thurgau, Switzerland, situated in a beautiful and fertile district on the Murg, 23 miles northeast of Zurich (Map: Switzerland, C 1). It is regularly built, and has among its buildings a Catholic church dating from 1286, and an old castle, the Government building, containing the cantonal archives and library, the town hall, and the military barracks. There is a technical school with scientific and historical collections. The town manufactures gloves, cotton and iron goods, guns, machinery and leather, and is also a centre of trade for wine, fruit, and agricultural products. Population (commune), in 1900, 7861.

FRAUENLOB, frau'en-löb (Ger., ladies' praise) (c.1250-1318). The assumed name of Heinrich von Meissen, one of the German minnesingers (q.v.). He is said to have established the first school of minstrelsy in Mainz, and so to have made himself a 'mastersinger' (q.v.) also. In token of appreciation for his chivalrous devotion to 'ladyhood,' ladies of Mainz are said to have borne his body to the grave in the cathedral. During the Werther period of German literature ladies restored his tombstone in 1783, and near it other ladies, in 1842, erected a beautiful monument. Frauenlob's erudite and artificial poems have been edited by E. H. Müller (1843), and his *Cantica Canticorum* has been translated into English.

FRAUENSTÄDT, frau'en-stët, JULIUS (1813-79). A German philosopher, born at Bojanowo, Province of Posen, Prussia. He studied theology and philosophy at Berlin, and subsequently became one of the most ardent disciples of Arthur Schopenhauer. Many of his works reflect the influence of that profound thinker, whose ideas Frauenstädt extends, but frequently also subjects

to some modification. Some of his more important works are: *Die Naturwissenschaft in ihrem Einfluss auf Poesie, Religion, Moral und Philosophie* (1855); and *Neue Briefe über die Schopenhauersche Philosophie* (1876); *A. Schopenhauer: Lichtstrahlen aus seinen Werken* (7th ed. 1891). He also edited the first complete edition of Schopenhauer's collected works (1873-74).

FRAUNCES'S TAVERN. One of the oldest buildings of New York City, at the southeast corner of Broad and Pearl Streets; originally a mansion of the Delanceys, and subsequently transformed into a tavern. Washington made it his headquarters after the British evacuation of New York, and in it took farewell of his officers on December 4, 1783. The New York Chamber of Commerce was organized in it in 1768. In 1902 it was purchased by the city to be preserved as an historic memorial.

FRAUNHOFER, frau'hö-fër, JOSEPH VON (1787-1826). A distinguished Bavarian optician and physicist, born at Straubing. In 1799 he was apprenticed to a glass-cutter in Munich, and in 1806 was received, as a working optician, into the establishment of Reichenbach & Utzschneider at Benedictbeuern, of which he later became the head, and which afterwards, in 1819, was removed to Munich. While there, he acquired considerable wealth and reputation through his inventions, and soon afterwards became proprietor of the establishment. He was especially successful in producing large pieces of optical glass free from imperfections, which could be used for prisms and lenses, and as he combined the mechanical skill and technique of the optician with the theoretical knowledge and mathematical training of the physicist, his instruments were always in demand. He invented a machine for polishing parabolic surfaces, and was the first one who succeeded in polishing lenses and mirrors without altering their curvature. Prisms made under his direction were celebrated for being free from inequalities and striæ. His inventions are numerous, and include a heliometer, a micrometer, an achromatic microscope, besides the great refracting telescope at Dorpat. But that which has rendered Fraunhofer's name celebrated throughout the scientific world is his discovery of the dark lines in the spectrum, which are now known by his name. (See SPECTROSCOPY.) He was the first to obtain a spectrum from a grating (see DIFFRACTION AND DIFFRACTION GRATINGS), and with this apparatus was able to measure the wave-length of sodium light. Fraunhofer was a diligent student and investigator as well as a successful instrument-maker, and was elected a member of the Munich Academy of Sciences (1817), and five years later became conservator of its physical cabinet.

FRAUNHOFER LINES. See SPECTROSCOPY.

FRAXINEL'LA. See DITTANY.

FRAXINUS. See ASH.

FRAY GERUNDIO, frä'e hä-röön'dé-ö. See LAFUENTE, MODESTO.

FRAY GERUNDIO DE CAMPAZAS, dà kám-pä'thäs. A romance by Isla (1758), satirizing the degraded type of pulpit oratory of the period in Spain.

FRAYSSINOUS, frâ'sé'nôô', DENIS, Count de (1765-1841). A French prelate, born at Curières. He became known at Paris for his pulpit oratory, and in 1816 was appointed Court preacher and first almoner to Louis XVIII. In 1824 he became Minister of Public Worship, but in 1828 resigned the post. He was compelled to leave France at the time of the July Revolution. In his own day his *Défense du christianisme* (3 vols. 1825) attracted great attention. The work was republished at Paris in 1889 (2 vols.). Consult the biography by Henrion (Paris, 2 vols. 1844).

FRAZER, JOHN FRIES (1812-72). An American scientist, born in Philadelphia, Pa. He graduated in 1830 at the University of Pennsylvania, in 1836 was appointed first assistant geologist in the first geological survey of Pennsylvania, and from 1836 to 1844 was instructor in chemistry and natural philosophy at the Philadelphia High School. From 1844 until his death he was professor of natural history and philosophy in the University of Pennsylvania. He was also vice-provost of the university in 1855-68. For some time he was connected with the Franklin Institute as a lecturer, and edited the *Journal* of the Institute, to which he contributed several papers, which constitute the most important part of his published writings. He was elected to the American Philosophical Society in 1842, and in 1863 became a charter member of the National Academy of Sciences.

FRAZER, PERSIFOR (1844—). An American geologist, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1862, was an aide on the United States Coast Survey in 1862-63, served as acting ensign in the Mississippi Squadron in 1863-65, and from 1866 to 1869 studied in the School of Mines at Freiberg, Saxony. In 1869-70 he was mineralogist and metallurgist on the United States Geological Survey, in 1870-74 was professor of chemistry in the University of Pennsylvania, and from 1874 to 1882 was assistant in connection with the second geological survey of Pennsylvania. Among his contributions to science may be cited his explanation of the cause of the white color of the moon as observed by day. He was elected to the American Philosophical Society in 1871. His publications include, in addition to four volumes of reports of the second geological survey of Pennsylvania: *Tables for the Determination of Minerals* (1874; 4th ed. 1896); *Bibliotics, or the Study of Documents* (1894; 3d ed. 1901), on which subject he is an authority, and upward of three hundred contributions to scientific periodicals.

FRAZIER'S or **FRAYSER'S FARM**, BATTLE OF; also called the BATTLE OF GLENDALE, the BATTLE OF CHARLES CITY CROSS ROADS, and the BATTLE OF NELSON'S FARM. A battle fought at Glendale, Va., about twelve miles southeast of Richmond, on June 30, 1862, during the Civil War, between a Federal force under General McClellan and a Confederate force under Generals Longstreet and Hill. The losses were about 1800 on the Federal and about 2000 on the Confederate side.

FRÉCHETTE, frâ'shét', LOUIS HONORÉ (1839—). A French-Canadian poet. He was born at Point Lévi, P. Q., and was educated at the

Quebec Seminary and Laval University. He was called to the bar in 1864, but was in newspaper work in Chicago for the following six or seven years. In 1874 he represented his native town in the Dominion Parliament, and practiced his profession in Quebec until 1879, when he went again into journalism, and successively edited three French papers, respectively in Quebec, Montreal, and Chicago. He is the representative poet of French Canada, and his productions have brought him honor from many societies, including the French Academy and the Imperial Institute, London. He was also made a knight of the Legion of Honor, and served as president of the Royal Society of Canada. His literary work includes a five-act play, entitled *Veronica*, and other dramas, one sketch in English called *Christmas in French Canada* (1899), and a few prose essays in French, and translations of Howells's *Chance Acquaintance*, and Cable's *Creole Days* into his native tongue; but he will be best remembered by his poems: *Mes loisirs* (1863); *La voix d'un exilé* (1869); *Pêle-mêle* (1877); *Les fleurs boréales* (1880); *Les oiseaux de neige* (1880); *La légende d'un peuple* (1887); and *Les feuilles volantes* (1891).

FRECKLES, frék'k'lz (older form *frecken*, from Icel. *freknur*, freckles; ultimately connected with Gk. *περκνός*, *perknos*, spotted), sometimes called *lentigo*. Small yellowish or brownish-yellow irregularly rounded spots, from the size of a pin's head to that of a split pea, frequently seen on the skin, especially of fair or reddish-haired persons, though they are seen even in mulattoes. They are not often met with under the age of six or eight. They are most common on the face, but often occur on the hands, and sometimes elsewhere. They are always most distinct in summer; but though the influence of the sun's rays undoubtedly increases their distinctness, it is doubtful whether it can cause them. They are due to increased local deposit of pigment-granules in the epidermis; and it may be noticed that persons subject to them do not bronze uniformly under the influence of exposure nearly so deeply as others. Many methods of treatment have been advocated for their removal; but in most cases they return upon exposure to the sun. Among the milder measures which sometimes succeed in improving the condition is a solution of hyposulphite of soda, 15 to 30 grains, or of chloride of ammonium, 15 grains to the ounce of water.

FREDEGAR, or **FREDEGAR'RIUS SCHOLASTICUS**. A chronicler of the Franks, who lived in the seventh century. He was one of the three compilers of the *Historia Francorum*, or a history of the Franks down to the year A.D. 642. The work is written in corrupt Latin, but is of great value as a source for the history of France during the first half of the seventh century. During the eighth century it was continued in the so-called *Gesta Francorum*. Consult Kruselis, *Fredегarii et Aliorum Chronica* (Hanover, 1888).

FREDEGUNDA (c.545-597). A Frankish queen. Originally a servant of Audovere, wife of Chilperic of Neustria, she soon won the King's heart, and got him to put his wife in a convent and to divorce her. But Chilperic married Galsvintha, and put away Fredegunda. Galsvintha

died in the same year (567), probably strangled by Fredegunda, who succeeded her as Queen. This brought on war between Chilperic and his brother Sigibert, King of Austrasia, and a bitter rivalry between Fredegunda and Brunhilda, sister of the murdered Queen and wife to Sigibert, who was soon assassinated by Fredegunda's agents at Vitry (575). Chilperic's sons by Audovere also died suddenly, and in 584 Chilperic was murdered, and by contemporary historians the Queen was accused of instigating all three murders. Now, with her son Clotaire upon the throne, she put forth all her efforts to kill Brunhilda and her son Childebert, and, unsuccessful in this, made war on Austrasia after Childebert's death, obtained possession of Paris and other cities, but died in the following year. See BRUNHILDA.

FREDERIC, HAROLD (1856-98). An American novelist and journalist. He was born in Utica, N. Y., August 19, 1856, and was London correspondent of the *New York Times* from 1884 till his premature death in Hornby, England, October 19, 1898. He was educated in Utica, worked at journalism there, in Albany, and in New York; but won distinction for novels, chiefly of rural life in central New York, written after his going to England. His first important story, *Seth's Brother's Wife* (1887), was followed by *The Lawton Girl* (1890); *In the Valley* (1890), a story of 1777; *The Return of the O'Mahoney* (1892); *The Copperhead* (1894), a story of the Civil War; and *Marsena* (1895), a collection of keenly humorous character stories. All these, however, were surpassed by *The Damnation of Theron Ware* (1896), a brilliant analysis of religious life in the American middle class, minutely realistic in detail, clever in conversation, and unflinching in psychic insight, immediately recognized by the public as a human document. His last works, *March Hares* (1896), *Gloria Mundi* (1898), and *In the Marketplace* (1899), were less significant. *The New Exodus* (1892) was a study of Anti-Semitism, the result of a visit to Russia, undertaken in 1891.

FREDERICH, FRÄDE-RIK, BERTHA (pseudonym, GOLO RAIMUND) (1825-82). A German novelist, born at Hanover. She was the wife of Eduard Frederich, editor of the *Hannoverscher Courier*, in which paper her first efforts appeared. In order to conceal her identity more effectually, she not only chose the above pseudonym, but managed to have the true authorship of her novels ascribed to a fictitious personage, "Georg Dannenberg." She wrote, in all, about twenty-two novels, nearly all of which have been republished. Among them are: *Bauernleben* (3d ed. 1888); *Zwei Bräute* (4th ed. 1888); *Schloss Elkrath* (3d ed. 1885); *Von Hand zu Hand* (2d ed. 1885); *Mein ist die Rache* (3d ed. 1885); *Zwei Menschenalter* (3d ed. 1886); *Ein deutsches Weib* (5th ed. 1886).

FREDERICIA, FRĖD'ÆR-Is'ſ-A. A seaport of Denmark, situated on the east coast of Jutland, on a projecting tongue of land, at the northern entrance to the Little Belt (Map: Denmark, C 3). The town is surrounded by fortifications, now falling into ruins, and has a famous bronze statue, "The Danish Soldier," erected in commemoration of the victory of the Danes over the Schleswig-Holstein forces in 1849. Fredericia is connected with Strib, on the island of Fünen,

by steamer, and carries on a considerable trade in exports of meat, fish, eggs, and imports of salt and petroleum. Population, in 1890, 10,000; in 1900, 12,700.

FREDERICK. A city and the county-seat of Frederick County, Md., 60 miles west-northwest of Baltimore; on the Baltimore and Ohio and the Pennsylvania railroads (Map: Maryland, H 3). It is situated in a beautiful and fertile valley near the famous battlefields of Monocacy and South Mountain. It is the seat of a State institution for the deaf and dumb, and Women's College (Reformed Church), organized in 1893, and has Boyd Academy and other educational institutions, and Emergency Hospital. There are large canning establishments, brick-works, planing-mills, and manufactures of flour, tobacco, fibre brushes, hosiery, leather, shutter-fasteners, and coaches. The government is administered under a charter of 1898 by a mayor, elected every three years, who controls the appointments to all municipal offices except that of city register, and a council elected at large. The city owns and operates its water-works and electric-light plant. Population, in 1890, 8,193; in 1900, 9,296. Frederick has been made famous by Whittier as the scene of Barbara Frietchie's exploit. Francis Scott Key, the author of the "Star-Spangled Banner," is buried in Mount Olivet Cemetery, and a splendid monument to him marks its entrance; and the remains of Roger B. Taney (q.v.) lie in the burial-grounds of the Roman Catholic Church. Frederick was first settled in 1745, and was incorporated in 1817. In 1755 Washington met Braddock here to prepare for the expedition against the French. Near by Robert Strawbridge, in 1764, organized a Methodist church, 'the first in Maryland and America.' Consult a sketch in Powell's *Historic Towns of the Southern States* (New York, 1900).

FREDERICK I. (1121-90). Holy Roman Emperor from 1152 to 1190, surnamed Barbarossa or Redbeard. He was born in 1121, succeeded his father, Frederick, as Duke of Swabia, in 1147, and his uncle, Conrad III., as King of Germany, in 1152. On his father's side he belonged to the Hohenstaufen family; on his mother's side to the Guelphs. In the early years of his reign Frederick reduced Germany to order, and then proceeded to reestablish the Imperial authority in Italy. The Lombard cities, with Milan at their head, flourishing and powerful, and strengthened by the Papal power in their opposition to the Imperial pretensions, were prepared to resist Frederick's attempt to subjugate them. After receiving the Lombard crown at Pavia, Frederick marched in 1155 to Rome, reinstated the authority of Pope Adrian IV., to whom he delivered up Arnold of Brescia, and was crowned Holy Roman Emperor. In 1158 he besieged and took Milan. In the same year, at a Diet held at Roncaglia, Frederick imposed upon the Lombard cities a full feudal régime. Although the cities submitted for the moment, they soon rebelled. In 1159 began the long contest between Frederick Barbarossa and Pope Alexander III., the successor to Adrian IV. The Emperor created an antipope in the person of Victor IV., the first of several antipopes set up by him. The city of Crema was reduced by Frederick after a long siege in 1160, and in 1161-62 he besieged and took Milan, and razed it to the ground. Frederick was tri-

umphant everywhere; but in 1167 the Lombard cities formed a league against him and renewed the struggle. Frederick was completely defeated at Legnano in 1176; and in 1183, in a peace concluded at Constance, he finally agreed to leave the Lombard cities the right to choose their own municipal rulers, and to conclude treaties and leagues among themselves, although he retained his suzerainty over them, together with the power of imposing certain fixed taxes. The difficulty of settling the Italian differences had been aggravated by the attitude of Pope Alexander III. At last, in 1177, Frederick made his peace with the Pope, and was enabled to turn his attention to Germany, where he had to contend with Henry the Lion (q.v.), Duke of Bavaria and Saxony, the powerful head of the House of Guelph. By his energetic measures Frederick succeeded in thoroughly humbling his troublesome vassal, and crushing the Guelph power in Germany. In 1189, having settled the affairs of the Empire and proclaimed universal peace in his dominions, he resigned the government to his eldest son, Henry, and at the head of about 100,000 men set forth for the Holy Land. After gaining two great victories over the Moslems at Philomelium and Iconium, he was drowned in the Calycadnus, a small stream in Cilicia (1190). His remains were rescued by his son, and buried at Tyre. The death of Frederick, which led to the dispersion of the Crusaders before any material advantage had been obtained over the infidels, excited the deepest grief in Germany, where his memory has always been cherished as that of the best and greatest of his race. Frederick made Poland tributary to the Empire, raised Bohemia to the rank of a kingdom, and erected the Margraviate of Austria into an independent hereditary duchy. He was a patron of learning, and enacted many admirable laws, some of which were based upon the Roman law. Consult: Prutz, *Kaiser Friedrich I.* (3 vols., Danzig, 1871-73); Fischer, *Kreuzzug Friedrichs I.* (Leipzig, 1870); Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vol. v. (Leipzig, 1880-95).

FREDERICK II. (1194-1250). King of Sicily from 1197, and Holy Roman Emperor from 1215 to 1250. He was a grandson of Frederick I., and the son of the Emperor Henry VI. and of Constance, heiress of Sicily. He was born at Jesi, near Ancona, in Italy, December 26, 1194. His mother secured the favor of Pope Innocent III. for her infant son by conceding many important privileges to the Papal chair; and on the death of Constance, in 1198, the Pope became the guardian of the young Prince. As early as 1208 Frederick assumed the reins of government in his realm, which included South Italy in addition to Sicily. Supported by the Pope, Frederick, in 1212, engaged in a contest for the Imperial throne of Germany, with Otho IV., who had as yet not succeeded in securing himself in its possession after his long struggle with the rival claimant, Philip of Swabia, assassinated by Otho of Wittelsbach, in 1208. The blow dealt to Otho IV. by Philip Augustus of France in 1214, in the battle of Bouvines, secured the triumph of Frederick, who was crowned at Aix-la-Chapelle in 1215. On his coronation Frederick took a vow to go on a crusade. Having secured the election of his son Henry as King of the Romans, and leaving Archbishop Engelbert of Cologne as his vicegerent, he went to Italy, and was crowned

Emperor at Rome, by Pope Honorius, in 1220. Frederick now devoted himself to the task of organizing his Italian territories. He founded the University of Naples, gave encouragement to the medical school of Salerno, invited to his Court men of learning, poets, and artists, and commissioned his Chancellor, Petrus de Vineis, to draw up a code of laws. Frederick, however, was hampered in his projects by the refractory conduct of the Lombard cities, which in 1226 renewed the league formed against Frederick Barbarossa, and still more by the opposition of the popes. As he delayed going on a crusade, he was threatened with excommunication unless he fulfilled his pledge. Being compelled to depart on this expedition, he made the necessary preparations for its prosecution, and actually started in 1227. He returned in three days, saying that he was ill, whereupon Gregory IX., the successor to Honorius III., excommunicated him. In 1228 Frederick again set out for the Holy Land. This second expedition proved successful, and in 1229 Frederick made a ten years' truce with the Sultan of Egypt, who gave up Jerusalem and the territory around Jaffa and Nazareth, Frederick crowning himself King of Jerusalem. The rest of his life was spent in attempting to bring his rebellious Lombard subjects to subjection, and in struggles with Popes Gregory IX. and Innocent IV. He died suddenly in 1250. Frederick II. was famed for his talents as a minnesinger, for his skill in all knightly exercises, and for his varied learning. He was tolerant in matters of religion, and in his reforms showed himself far in advance of his time. His strong sympathies with his Italian mother-land, and his unrelenting endeavors to establish a compact and all-supreme empire in Italy, were the causes, not only of his own misfortunes, but of the miseries which he brought upon Germany; for, by embroiling him in costly wars abroad, they led him to neglect the welfare of his German subjects. Consult: Huillard-Bréholles, *Historia Diplomatica Friderici Secundi* (12 vols., Paris, 1852-1861), the first volume of which gives an excellent account of him; Blondel, *Etude sur la politique de l'empereur Frédéric II. en Allemagne* (Paris, 1892). See HOHENSTAUFEN.

FREDERICK III. (1415-93). Holy Roman Emperor from 1440 to 1493; as German King, Frederick IV. He was the son of Ernest, Duke of Austria, and was born September 21, 1415. After the death of the Emperor Albert II., in 1439, he was elected his successor in 1440, and two years afterwards he was solemnly crowned at Aix-la-Chapelle. Ten years later he received the Imperial crown at the hands of the Pope. In the Concordat of Vienna with the Papacy, concluded in 1448, in the bringing about of which the Emperor's adviser, Æneas Sylvius (the future Pius II.), had an important share, the Church in Germany sacrificed the advantages obtained by the restrictions imposed upon Papal authority at the Council of Basel. Frederick's only desire was to increase the hereditary possessions of his house. He failed to get the crown of Hungary, to which he laid claim, and even lost possession of Austria for a time, Vienna itself falling into the hands of the Hungarian King, Matthias Corvinus. He did nothing to check the progress of the Turks. He died in 1493, after an inglorious reign of fifty-three years. In 1477 he married his

son and successor Maximilian to Mary, the heiress of Charles the Bold of Burgundy. From his time the Imperial dignity continued permanently in the House of Austria. Consult: *Aeneas Sylvius, Historia* (Strassburg, 1685); Coxe, *House of Austria* (3d ed., London, 1847).

FREDERICK I. (c.1471-1533). King of Denmark and Norway, from 1523 to 1533. With his elder brother John he was joint ruler of the duchies of Schleswig and Holstein at the time his nephew Christian II. was dethroned (1523). Frederick was elected to succeed him. A long war, waged for the possession of Norway, ended in his favor. He showed great cruelty to his unfortunate relative, whom he detained in close captivity; but he was an able ruler. He embraced the Lutheran faith, which spread in his dominions. He granted the nobility many privileges at the cost of the power of the Crown.

FREDERICK III. (1609-70). King of Denmark from 1648 to 1670. He was the son of King Christian IV., and in his youth held several high ecclesiastical offices, being made Bishop of Verden in 1623 and Archbishop of Bremen in 1634. On the death of his father in 1648 he became King of Denmark and Norway. The country had been reduced by war to a state of great misery, but Frederick nevertheless plunged into a struggle with Sweden (1657) in the hope of regaining the provinces which had been lost by the treaty of Brömsebro in 1645. Poland, Brandenburg, and Holland were his allies. Charles X. of Sweden invaded Jutland, overran Fünen and Zealand, and forced Frederick to sign the Treaty of Roeskilde, February 28, 1658, by which a number of the Danish islands and a portion of Norway were ceded to Sweden. Hostilities were resumed by the Swedes in the same year, but Frederick, with the aid of Brandenburg, succeeded in expelling the Swedes from Jutland, and Charles X. was compelled to raise the siege of Copenhagen in 1659. Abandoned, however, by his allies, Frederick was forced to conclude peace in 1660, on the most unfavorable terms, being obliged to relinquish all claims to the territories which Denmark had possessed in the Swedish part of the Scandinavian peninsula. The latter part of his reign was rendered memorable by the transformation in the nature of the government, which was changed to an hereditary and absolute monarchy by the voluntary act of the commons and clergy, who, out of hatred for the nobility, surrendered to the Crown the liberties and prerogatives which they had hitherto enjoyed.

FREDERICK V. (1723-66). King of Denmark from 1746 to 1766. He was the son and successor of Christian VI., and one of the best and wisest of the absolute monarchs of his time. With the exception of a threatened attack by Peter III. of Russia, nothing disturbed the peace of his reign. Denmark owed to him the increase of her national wealth, and the encouragement of various branches of commerce and manufacture. Frederick established the Asiatic Company, opened the American colonial trade to all his subjects, founded the military academy of Sorø, in Denmark, and caused schools to be opened at Bergen and Trondhjem, in Norway, for the instruction of the Laplanders. He established academies of painting and sculpture at Copenhagen, and sent a number of learned men—among whom was

Niebuhr, the father of the historian—to travel and make explorations in the East.

FREDERICK VI. (1768-1839). King of Denmark from 1808 to 1839, and of Norway from 1808 to 1814. He was the son of Christian VII. and Caroline Matilda of England, and assumed the regency in 1784, on account of the insanity of his father, on whose death, in 1808, he ascended the throne. During his reign serfdom was abolished in Denmark and Schleswig-Holstein, monopolies were abrogated, the criminal code was amended, and the slave trade prohibited. All this was largely the work of Frederick's great Minister, Bernstorff (q.v.). In 1800 Denmark joined the armed neutrality of the North, formed against England by Russia, Sweden, and Prussia. This led to the seizure by England of all Danish vessels in British ports, and to the dispatch of a powerful fleet, under Sir Hyde Parker and Nelson, to force the Regent to withdraw from the convention. His refusal was followed by a fierce naval engagement at Copenhagen (April 2, 1801), in which the Danish fleet was almost wholly destroyed. A peace was concluded on the Regent's withdrawal from the confederation; but in consequence of his persistence in maintaining an attitude of neutrality, instead of combining with Great Britain against Napoleon, the war was renewed in 1807 by the appearance before Copenhagen of a British fleet. Copenhagen was bombarded for three days (September 2-5), the arsenals and docks destroyed, and all the shipping disabled, sunk, or carried to England. This blow paralyzed the national resources, and brought ruin on the country. In retaliation Frederick became the ally of Napoleon, and suffered in consequence. In 1814 Norway was taken by the Allies from Denmark and given to Sweden. The State became bankrupt, and many years passed before order could be restored to the finances. Notwithstanding his autocratic tendencies, Frederick so far yielded to the movements of the times as to establish representative provincial councils in 1831-34. He died December 3, 1839. Consult Giessing, *Zur Regierungsgeschichte Friedrichs VI.* (Kiel, 1851-52).

FREDERICK VII. (1808-63). King of Denmark from 1848 to 1863. He succeeded his father, Christian VIII., who died January 20, 1848. The principal events of his reign were the wars and diplomatic negotiations arising out of the revolt of the duchies of Schleswig and Holstein, and the dispute over the succession to Denmark proper and the duchies on the death of the King and of his uncle, the heir presumptive, both of whom were childless. Notwithstanding the heavy expenses of the Schleswig-Holstein War (1848-51), the material prosperity of the country increased during Frederick's reign. See SCHLESWIG-HOLSTEIN.

FREDERICK I. (1657-1713). The first King of Prussia, 1701 to 1713; previous to his assumption of the royal title, Elector of Brandenburg (1688-1701), as Frederick III. He succeeded his father, Frederick William, the Great Elector of Brandenburg, in 1688. His name is a synonym for vanity and extravagance, but his subjects, nevertheless, loved him, and his expenditures did not greatly affect the condition of the national finances. In the first half of his reign his main concern was the acquisition of the royal title, in which endeavor he was assisted

by the difficult position of the Emperor Leopold I., who pledged his consent, after a year of negotiation, on the eve of the outbreak of the War of the Spanish Succession. In return for the Imperial permission, Frederick was to furnish a considerable body of troops and in general to further the interests of Austria. His troops helped to win the day for the Allies on more than one occasion, yet at the Peace of Utrecht his only reward was a small district in Gelderland. In this treaty Prussia was, however, recognized in the possession of Neuchâtel, which had fallen to her by inheritance. Frederick I. is remembered to-day as the patron of learned and liberal-minded men—of Spener, Francke, and Thomasius, and above all of Leibnitz. He is also known as the founder of the Order of the Black Eagle, which is still considered the greatest mark of distinction that a King of Prussia can bestow. Frederick died February 25, 1713. Consult: Henderson, *Short History of Germany* (New York, 1902); Pierson, *Preussische Geschichte* (Berlin, 1898); Tuttle, *History of Prussia* (Boston, 1884-88).

FREDERICK II. (1712-86). King of Prussia from 1740 to 1786, known as **THE GREAT**. He was born January 24, 1712, and was the son of Frederick William I. (q.v.) of Prussia and of Sophia Dorothea, daughter of George I. of England. The plan of education pursued by his father soon tended to render their relations unbearable. Frederick William insisted on instilling into his son his own practical instincts, and stifled the literary and artistic impulses which Frederick manifested at an early age. For the son's faults, his inclination to extravagance and self-indulgence, the father had nothing but the harshest repressive measures. At last Frederick determined to escape the parental tyranny by flight to England. The plot was discovered, and the most severe punishment followed. Frederick's aider and abettor, Lieutenant Katte, was beheaded before his eyes, and the Prince himself was led to expect a similar fate. The father, however, relented, and Frederick was placed, instead, in the War and Domain Bureau at Cölln, and made to work as an assistant clerk. Here he learned most valuable lessons with regard to the task of administering a great kingdom. A reconciliation finally took place between father and son. The only act which Frederick never forgave his father was his forced marriage, for reasons of State policy, with Elizabeth of Brunswick-Bevern, whom he respected but never loved.

Frederick's great wars fall in the first half of his reign. Almost immediately after his accession, on the news of the death of the Emperor Charles VI., and the accession of his daughter, Maria Theresa, in the Hapsburg dominions, he invaded Silesia, basing his claim to a large part of the country on an old transaction in which Austria had played a grasping and dishonest part. (See **SUCCESSION WARS**.) In the first battle of the Silesian campaign—that of Mollwitz, April, 1741—Frederick's General (Schwerin) found the situation so critical that he urged the King to fly for his life, and Frederick did not know until the next day that he had won the victory. Mollwitz gained for Frederick the French alliance, and practically decided the campaign. After the victory of Frederick at Chotau-

sitz, Maria Theresa agreed to the Peace of Breslau (1742), in which France, however, was not included. In this treaty Austria ceded most of Silesia to Prussia. Two years later Frederick reentered the struggle, ostensibly as the champion of the Emperor, the Bavarian Charles VII. France was still his ally, while Maria Theresa could count on England, Saxony, and Holland. Frederick took Prague, but was forced to abandon the city and make a disastrous retreat. He soon retrieved his fortunes, however, at Hohenfriedberg (June, 1745), and his victory over the Saxons at Kesseldorf (December, 1745) was followed by the Treaty of Dresden, which was a repetition of the Peace of Breslau. In 1756 Maria Theresa, inconsolable for the loss of Silesia, formed an alliance against Prussia with France (the old enemy of the Hapsburgs), Russia, Saxony, and Sweden. England, as the enemy of France, now sided with Frederick. The King of Prussia at once descended upon Saxony, thus opening the great struggle which involved all the European powers and their colonies. (See **SEVEN YEARS' WAR**.) The outcome of this gigantic conflict, which was the culmination of Frederick's military career, but which taxed the resources of his little kingdom to their utmost, left Prussia in 1763 territorially unchanged, and in the enjoyment of great military prestige.

Frederick had come through the war without incurring a national debt or increasing the direct taxes; on the other hand, he had inflated the currency; but by wise measures he soon put the finances of Prussia on a sound basis. He practiced the most rigid economy in the royal household, and was enabled to spend large sums in agricultural and industrial improvements. He reclaimed thousands of acres of waste land by a system of canals and drainage, peopled them with colonists, and set on foot a large number of industries, visiting at intervals every part of his dominions. He began a codification of the law, abolished serfdom within the royal domains, insisted on the impartial administration of justice, granted freedom of speech, and, at least in literary and scientific matters, liberty of the press. Tolerant toward every form of religious belief, he was one of the most intolerant of autocrats toward his Ministers. To his enlightened despotism were due the regulation of customs and the equalization of taxation. He grimly put a tax on the hired Hessians that passed through his dominions, as 'on cattle bought and sold.' Frederick took a great interest in the American Revolution, and admired and appreciated the greatness of Washington, and was one of the first sovereigns to conclude a commercial treaty with the United States. The desertion of Prussia by England at the critical period in the Seven Years' War had inspired in Frederick a bitterness toward the latter country which permanently influenced his foreign policy. On the other hand, he had drawn closer to Russia after the death of his uncompromising enemy, the Empress Elizabeth, and he and Catharine II. were able to see their value as allies to each other; hence the partition of Poland.

Frederick's relation to the intellectual development of Germany was peculiar. Although Prussia had become through him one of the great Continental powers, he had no sympathy whatever with German national aspirations. While he foresaw the future literary greatness of Ger-

many, he ignored the eminent writers who were appearing upon the scene, and despised the German language, which he never wrote with ease. French he spoke and wrote fluently, though he did not spell it correctly. He cultivated the society of French writers and scholars, among them Voltaire and Maupertuis, whom he invited to Sans-souci. He was consistent in his admiration of Voltaire, though not blind to his personal weaknesses. Conversation with his literary friends, and playing on the flute, on which he was a really skillful performer, were Frederick's only relaxation from incessant work. He was a voluminous writer. Of his numerous works, the most important are: *Mémoires pour servir à l'histoire de Brandebourg*; *Histoire de la guerre de Sept Ans*; and the *Anti-Macchiavel*, written before he became King, in which he laid down his views on government. The Berlin Academy published an edition of his collected works, in thirty volumes, edited by Preuss (1846-57).

Throughout his reign Frederick took the greatest interest in the improvement of the Prussian Army. He wrote for the guidance of his generals a number of works covering the whole science of war; and the army, which numbered 80,000 men when he ascended the throne, had been increased to nearly 200,000 in his lifetime. Frederick died August 17, 1786, at Sans-souci.

Consult: Tuttle, *History of Prussia Under Frederick the Great* (3 vols., Boston, 1888), the best work in English, unfortunately cut short at 1757 by the death of the scholarly author; Longman, *Frederick the Great and the Seven Years' War* (New York, 1881), a useful little compendium. Carlyle, *History of Frederick II.* (London, 1888), is, on the whole, inadequate as history. These are the principal useful works in English. The greatest living authority is Koser, whose *Friedrich der Grosse als Kronprinz* (Stuttgart, 1901) is a small classic. His larger history is nearing completion. See also Lavissee, *La jeunesse du grand Frédéric* (Paris, 1891), and *Le grand Frédéric avant l'avènement* (Paris, 1893); Preuss, *Friedrichs des Grossen Lebensgeschichte* (Berlin, 1832-34); Kugler, *Geschichte Friedrichs des Grossen* (12th ed. Leipzig, 1887); and numerous other general and special studies, a bibliography of which may be found in Lavissee and Rambaud, *Histoire générale*, vol. vii. (Paris, 1893-1900).

FREDERICK III. (1831-88). German Emperor and King of Prussia from March 9 to June 15, 1888. Before his accession to the throne he was known as Frederick William. He was the only son of William I., King of Prussia and first Emperor of united Germany, and was born October 18, 1831. His earnest character and decided talents were developed under the care of excellent masters, among others Ernst Curtius (q.v.), who accompanied him to the University of Bonn, where the Prince was matriculated in the law faculty. After the completion of his education, the Prince visited several foreign countries. In England he became attached to the Princess Royal, Victoria, to whom he was married, January 25, 1858. The marriage was highly approved by both nations, and the life of the royal couple was an exceedingly happy one. After his father's accession to the throne, the Crown Prince took part in the more impor-

tant affairs of the State. During the war with Denmark in 1864 he was sent to the scene of operations in order to exert his personal influence toward removing the friction among those in charge of affairs. In the war with Austria in 1866 he commanded the Second Prussian Army, and by a forced march arrived on the scene of the battle of Sadowa in time to decide the issue. In the Franco-German War he commanded the Third Army, consisting of the South German forces. He won the first victory of the war, that of Weissenburg (August 4th), and inflicted a decisive defeat on the army of MacMahon at Wörth (August 6th). Seconded by the Crown Prince of Saxony, he vanquished MacMahon at Sedan, and compelled him to surrender with his whole army (September 2d). Two weeks later he began the investment of Paris, and had the principal share in its reduction. He played a considerable part in the founding of the new German Empire, although his plans differed in some essential respects from those advocated by Bismarck. During the Emperor's illness, caused by an assassin's shot in 1878, his public functions were discharged by the Crown Prince, who showed great ability in the performance of his duties. In January, 1887, he was attacked by a cancerous throat trouble, necessitating several surgical operations, which were heroically borne. On the death of his father, March 9, 1888, he ascended the throne as Frederick III. He died June 15th of the same year. Liberal, cultivated, and a friend of parliamentary government, he was greatly beloved by all, especially by the army, and bore the popular appellation of "Unser Fritz." He wrote diaries of his travels in the East, and of his part in the wars of 1866 and 1870-71. He had eight children, the eldest of whom is the reigning Emperor, William II. (q.v.).

FREDERICK I. (1425-76). Elector Palatine, called the Victorious. At the death of his father, in 1439, a portion of the Palatinate devolved upon him, which he later ceded to his brother, Louis IV. In 1449, upon the death of Louis, he assumed the guardianship of his infant nephew Philip, and administered the Government. In 1451 the country, being troubled by warlike neighbors, Frederick persuaded the estates to invest him with the dignity of Elector for life, with the understanding that his children should not rank as princes, and that the succession should devolve upon his nephew. A coalition was at once formed against him, headed by the Emperor Frederick III.; but he defended himself ably, and in 1462 won a great victory over his enemies at Seckenheim. His success secured him undisturbed possession of his principality until his death. The territory of the Palatinate was greatly increased during his reign.

FREDERICK II. (1482-1556). Elector Palatine, surnamed the Wise. He was the fourth son of Philip the Magnanimous, and assumed the Electoral crown in 1544, succeeding his brother Louis. When, in 1529, the Sultan Solymán besieged Vienna, Frederick assumed command of the Imperial army. In 1535 he married Dorothea, daughter of Christian II., ex-King of Denmark. Through the teaching of Melancthon he became familiar with the principles of the Reformation, and joined the Schmalkald League. In later life he signed the Augsburg Interim.

FREDERICK THE GREAT
FROM A PAINTING BY GEORGE MEYN

FREDERICK III. (1515-76), Elector Palatine, surnamed the Pious. He succeeded his father, John II., in the ducal possessions of the Simmern Palatinate in 1557, and upon the extinction of the elder Palatine line became Elector Palatine in 1559. From Lutheranism, which he embraced in 1546, he passed over in 1561 to Calvinism, and by his energetic measures to impose his belief upon his subjects aroused the hatred of the Lutheran princes. As a fervent champion of Protestantism he lent aid to the adherents of the reformed religion in France and in the Netherlands. He laid the foundation of systematic Calvinism by causing the Heidelberg Catechism to be drawn up in 1563, devoting his personal attention to the work.

FREDERICK IV. (1574-1610). Elector Palatine, surnamed the Upright. He was the son of the Elector Louis VI. and Elizabeth of Hesse. His father died during his infancy, and Frederick succeeded to the throne in 1583, under the guardianship of his uncle, John Casimir, but only assumed the reins of government in 1592, upon his uncle's death. The steadfast and firm support he accorded to the Protestant cause renders his reign important. Through his influence the Protestant Union was formed in 1608. He raised Mannheim, where many Protestants had taken refuge, to the dignity of a town.

FREDERICK V. (1596-1632). Elector Palatine and King of Bohemia. He was the third son of the Elector Frederick IV., whom he succeeded in the Palatinate in 1610. He married, in 1613, Elizabeth, the daughter of James I. of England, through whose ambitious counsels he was induced to take a prominent part in the proceedings of the union of the Protestant princes of Germany, and finally, although against his own inclinations, to accept the dignity of King of Bohemia in 1619. His complete defeat at the battle of the White Hill, November, 1620 (see THIRTY YEARS' WAR), terminated his short-lived enjoyment of the regal crown, of which he retained no other memorial than the mocking title of 'the Winter King.' The rest of his life was spent in exile, under the ban of the Empire, and with no resources beyond those which he could obtain from the generosity of his friends. In 1623 he was declared to have forfeited his Electoral title and his dominions in the Palatinate. The Electoral dignity and the Upper Palatinate were conferred upon his cousin, Maximilian of Bavaria, the head of the Catholic League. Frederick's daughter Sophia became the wife of the first Elector of Hanover and the mother of George I. Her daughter married Frederick I. of Prussia, and was the grandmother of Frederick the Great. Consult Gindely, *Geschichte des dreissigjährigen Krieges* (Prague, 1869-80).

FREDERICK I. (1372-1440). First Elector of Brandenburg, of the House of Hohenzollern, originally Frederick VI., Burgrave of Nuremberg. After serving in the Hungarian Army he married, in 1401, Elizabeth of Bavaria, whose beauty and accomplishments were widely celebrated. As a reward for the support which he gave to Sigismund as candidate for the Imperial crown, he was given possession of Brandenburg in 1415, and in 1417 was invested with the Electoral dignity, thus becoming the founder of the royal Prussian dynasty.

FREDERICK III., ELECTOR OF BRANDENBURG. See FREDERICK I., King of Prussia.

FREDERICK I. (1369-1428). Elector and Duke of Saxony, called the Pugnacious. He was the son of Frederick the Stern, of Meissen. With his two brothers he succeeded, on the death of the father, in 1381, to the inheritance; but they were compelled to divide with their two uncles. Frederick distinguished himself as a soldier, and in 1423, in recognition of his successes against the Hussites, Emperor Sigismund made him Elector and Duke of Saxony. He was defeated by the Hussites at Aussig, in 1426. He founded the University of Leipzig, in 1409.

FREDERICK III. (1463-1525). Elector and Duke of Saxony, called the Wise. He was a grandson of Frederick II., and succeeded his father, Duke Ernest, in the Government. He founded the University of Wittenberg in 1502, and called Luther and Melancthon to chairs in the faculty. He never adopted the creed of the Reformers, but he accorded them toleration, protected Luther at the Diet of Worms, and sheltered him in the castle of Wartburg. In 1493 he visited the Holy Land, and in Jerusalem was made a Knight of the Sepulchre. He brought about many reforms in the constitution of the Empire, and on the death of Maximilian I., in 1519, he was offered the Imperial throne, but declined it, and recommended Charles I. of Spain, who became Emperor as Charles V. Consult Kolde, *Friedrich der Weise und die Anfänge der Reformation* (Erlangen, 1881).

FREDERICK II. (1720-85). Landgrave of Hesse-Cassel. He succeeded to the Government in 1760. He contributed greatly to the improvement and embellishment of the city of Cassel, which owes its Museum, its Academy of Fine Arts, and a number of the fine buildings which are at present its chief pride and boast, to him. In order to provide for his lavish expenditures, he sold a corps of 12,000 soldiers to England during the war of that country with the American colonies.

FREDERICK II., called PRINCE OF HOMBURG (1633-1708). A German general, Landgrave of Hesse-Homburg. He entered the Swedish service, and fought with great distinction at the siege of Copenhagen in 1659. It was, however, in the service of Brandenburg that he achieved the greatest celebrity. He was made general of cavalry by the Great Elector, Frederick William, and had a great share in the victory over the Swedes at Fehrbellin in 1675. In 1681 he succeeded his brother in Hesse-Homburg. The complete restoration of Homburg, now one of the most beautiful spas of Germany, was chiefly due to him.

FREDERICK I., WILLIAM CHARLES (1754-1816). Duke and subsequently first King of Württemberg. He was born at Treptow, Pomerania, and was a son of the famous Sophia Dorothea, niece of Frederick the Great. After serving in the Prussian and Russian armies, he in 1797 succeeded to the dukedom, and in 1803 was invested with the Electoral dignity. At the close of 1805, Napoleon, in reward for his alliance against Austria, erected his State into a kingdom, and on January 1, 1806, Frederick assumed the royal title. He soon afterwards joined the Confederation of the Rhine. Although the territory over which he ruled was greatly enlarged during

his reign, his autocratic government and subserviency to Napoleon I. found little favor among his subjects, upon whom the oppressive conditions imposed by enforced conscription, excessive taxation, and other evils weighed most heavily. Frederick joined the league against France after the battle of Leipzig.

FREDERICK I., WILLIAM LOUIS (1826—). Grand Duke of Baden. He was born at Karlsruhe, son of the Grand Duke Leopold and of Princess Sophia of Sweden. He was educated at the universities of Heidelberg and Bonn, and, after acting as Prince Regent for four years, succeeded to the Government in 1856. Immediately upon his accession to the throne he restored the Constitution of the grand duchy, and during a Government of nearly fifty years he has zealously endeavored to promote economic and educational progress. He sided with Austria in the war of 1866, but after the defeat of that power he deemed it best to enter into close relations with Prussia and the North German Confederation.

FREDERICK AUGUSTUS I. (1750-1827). Elector (as such Frederick Augustus III.), and from 1806 first King of Saxony. He was the son of the Elector Frederick Christian, and succeeded his father under the guardianship of his uncle, Prince Xavier, in 1763. In 1768 he was declared of age. In 1769 he married Princess Maria Amelia of Zweibrücken. He sided with Frederick the Great against Austria in the War of the Bavarian Succession (1778-79), and afterwards joined the League of German Princes. In 1791 he was offered the crown of Poland, but declined it. In 1792 he reluctantly took up arms against France. During the war between France and Austria, in 1805, he maintained a strict neutrality; but in the following year he joined Prussia against France. The disastrous battle of Jena forced him to conclude a treaty of alliance with Napoleon. December, 1806. He was allowed to assume the royal title, and joined the Rhenish Confederation. In 1807 he was invested with the newly created Duchy of Warsaw, but was ruler of it only in name, the control being exercised by Napoleon himself. During the subsequent wars of Napoleon he was a faithful ally of the Emperor. He was taken prisoner by the Allies after the entry into Leipzig, October 19, 1813, and by the decrees of the Congress of Vienna he was compelled to cede more than half of his kingdom to Prussia. He devoted the remainder of his life to the development of the agricultural, commercial, and industrial resources of his kingdom, and directed his attention especially to the administration of justice. He died at Dresden, May 5, 1827.

FREDERICK AUGUSTUS II. (1797-1854). King of Saxony from 1836 to 1854. He was the eldest son of Prince Maximilian of Saxony, and brother of Frederick Augustus I., and of Caroline Maria Theresa of Parma. In 1830, on the outbreak of political disturbances in Dresden, he was named joint Regent of the kingdom with King Anthony, and his wise measures speedily quelled all discontent. In 1836 he succeeded Anthony on the throne. In spite of the enlightened liberality of his administration, Saxony was not to escape the political troubles which assailed Germany in 1848. An insurrection in Dresden in May, 1849, obliged him to avail himself of the help of Prussian troops. But the rising once

quelled, his reign continued tranquil and prosperous. He died as the result of a fall from his carriage while traveling in Tyrol, August 9, 1854.

FREDERICK CHARLES (1828-85). Prince of Prussia. He was the only son of Prince Charles, brother of Emperor William I., and was educated at Bonn. He served with distinction in the early stage of the first Schleswig-Holstein war, which began in 1848. He next took part in the suppression of the revolutionary struggle in Baden in 1849, after which he devoted himself assiduously to the study of military science. Some time afterwards he delivered a lecture entitled "*Die Kampfweise der Franzosen*," which subsequently appeared in the form of a treatise, and was republished in France as *L'Art de combattre l'armée française* (1860). During the Danish War of 1864 he won laurels by storming the fortifications at Düppel (April 18, 1864), and in the following month he was intrusted with the chief command of the allied forces. He was commander of the First Division of the army during the conflict with Austria (1866), and after winning the skirmishes of Podol, Münchengrätz, and Gitschin in rapid succession, obstinately defended the Prussian centre at the battle of Sadowa until the arrival of the army of the Crown Prince. Still more conspicuous was his leadership during the Franco-German War of 1870-71, when he commanded the Second Army, consisting of six army corps, 500 guns, and 260,000 men. He defeated Bazaine at Vionville (Mars-la-Tour) on August 16, 1870, and two days later, seconded by General Steinmetz, at Gravelotte, ultimately compelling Bazaine to capitulate with his army of about 180,000 men, and to surrender the fortress of Metz (October 27th). He subsequently defeated the Army of the Loire, under General Aurelle de Paladines, after a campaign of six weeks. After the war he became inspector of Prussian cavalry.

FREDERICK FRANCIS II. (1823-83). Grand Duke of Mecklenburg-Schwerin. He was a son of Grand Duke Paul Frederick and of the Princess Alexandrine of Prussia, and was educated at Bonn. He ascended the throne in 1842, and in the same year he was appointed general in the Prussian Army, in which capacity he fought with distinction in the War of 1866. As commander of the Thirteenth Army Corps he participated in the siege of Metz (1870), and subsequently invested the fortress of Toul, which surrendered on September 23, 1870. In December he distinguished himself in the operations on the Loire. During the siege of Paris, where he commanded the divisions guarding the approaches to the besieging army, he acted for some time as chief of the General Staff. A magnificent monument was erected to his memory at Schwerin, in 1893.

FREDERICK LOUIS (1707-57). Prince of Wales. He was born at Hanover, Germany, the eldest son of George II. and Queen Caroline. He came to England at the age of seventeen, was appointed Prince of Wales in 1729, and married the Princess Augusta of Saxe-Gotha in 1736. He is described as of a generous but dissolute and unreliable character. His son afterwards came to the throne as George III.

FREDERICK WILLIAM (1620-88). Elector of Brandenburg from 1640 to 1688, commonly called the Great Elector. He was the son of

the Elector George William, and was born February 16, 1620. On his accession he found an empty exchequer, the towns and cities depopulated, and the whole electorate devastated by the ravages of the Swedish and Imperialist armies during the Thirty Years' War, which was not yet concluded. A portion of his inheritance had even been seized by the Swedes. His first acts were to regulate the finances, and to conclude a treaty of neutrality with Sweden, which left him at leisure to devote himself to the organization of his army and the re-peopling of the deserted towns and villages by means of immigration. By the Treaty of Westphalia, in 1648, he secured Further Pomerania (east of the Oder), and received the bishoprics of Halberstadt, Minden, and Kammin as lay principalities, together with the reversion of the See of Magdeburg. In the course of ten years he had, by the help of his generals, Derfflinger, Schomberg, and Kannenberg, created an army of 25,000 men, organized on the Swedish model. In 1656 he entered into an alliance with Charles X. of Sweden against Poland, and coöperated with him in the taking of Warsaw. In the following year he forsook the Swedish alliance, and placed himself on the side of Poland, which, in the Treaty of Wehlau, renounced its suzerainty over the Duchy of Prussia. The aggressions of Louis XIV., who sought to extend the French dominions to the Rhine, and made an onslaught upon Holland, alarmed the Elector, who induced the Emperor Leopold I., the King of Denmark, and the Elector of Hesse-Cassel to enter into a league against France (1672). The result was unfavorable to the cause of the German princes, and Frederick William was obliged to content himself with making highly disadvantageous terms in the following year. The war was soon renewed, and Brandenburg was again laid open to the incursions of the Swedes, who, at the instigation of Louis XIV., advanced upon Berlin, laying waste everything on their march. The Elector, who had taken up his winter quarters in Franconia, hurried across the Elbe at the head of his cavalry, and signally defeated the Swedes at Fehrbellin (June 18, 1675), driving them from his dominions. Deserted, however, by the other German princes, and his dominions overrun by the troops of Louis, he was obliged to agree to the Treaty of Saint-Germain, by which he restored all his conquests to the Swedes, in return for the withdrawal of the French army and an indemnity of 300,000 crowns. After this Frederick William devoted himself to the task of furthering the prosperity of his dominions. By his reception of 20,000 French Protestants, after the revocation of the Edict of Nantes (q.v.), and the encouragement which he afforded to the immigration of Hollanders and other foreigners, he augmented the population of his States, and introduced numerous industries among his subjects. He founded the University of Duisburg and the Royal Library at Berlin, and reorganized the universities of Frankfort-on-the-Oder and Königsberg. He opened canals, established a system of posts, and greatly enlarged and beautified Berlin. He left a well-filled exchequer and a highly organized army. Consult: Tuttle, *History of Prussia, 1134-1740* (Boston, 1884); Hiltl, *Der grosse Kurfürst und seine Zeit* (Bielefeld, 1893); Philippson, *Der grosse Kurfürst* (Berlin, 1897-1902).

FREDERICK WILLIAM (1771-1815). Duke of Brunswick. He entered the Prussian service in 1788, and was actively engaged with the army during the war with France, which began in 1792, and after the battle of Auerstädt, in which his father was mortally wounded, but in which the son took no part, was taken prisoner at Lübeck (November 7, 1806). On the death of his eldest brother he would have succeeded to the dukedom, had not Napoleon put a veto on his accession. Frederick William joined Austria in the war against Napoleon in 1809. He raised a corps of volunteers in Bohemia, invaded Saxony, and, reinforced by an Austrian detachment, took Dresden and Leipzig. The defeat of the Austrians at Wagram left him isolated in Central Germany, and he determined to make for the North Sea and England. With 1500 men he set out from Leipzig (July 20th), passed through Brunswick, where he overthrew 4000 Westphalians under Reubel, crossed the Weser, reached Elsfleth, seized all the available shipping and sailed for England (August 7th). He was received with enthusiasm, entered the English service with his men, and afterwards took part in the War of the Peninsula, where he served with distinction till his return to his own dominions in 1813. His attempts to maintain an excessive army and to force reforms upon his people made him very unpopular. He joined the allied army with a force of 8000 men after the return of Napoleon from Elba, and fell while leading his men at Quatre-Bras, on June 16, 1815.

FREDERICK WILLIAM I. (1688-1740). King of Prussia from 1713 to 1740. He was the son of Frederick I., and was born August 15, 1688. He was in almost every particular the opposite of his father—simple and almost penurious in his habits, attending to business, passionately fond of military exercises, averse to culture, fond of the society of the low and illiterate, and carrying to the utmost his ideas of arbitrary power and the divine right of kings. The public events of his reign were of little importance. From Charles XII. of Sweden he wrested a great part of Hither Pomerania, including Stettin, playing a rôle which he himself confessed was not fit for an honest man. He died at Potsdam, May 31, 1740. As the founder of an administrative system, of which he himself worked out the minutest details, Frederick William stands prominent among the monarchs of his century. By his economy and reforms in the finances he was able to indulge his taste for the organization of military forces. His childish love for tall soldiers induced him to resort to the most flagrant outrages, both at home and abroad, for kidnapping tall men and forcing them into his service. The result of this system, which was greatly moderated toward the end of his reign, was that he left at his death a well-drilled army of 80,000 soldiers. What was of more consequence to his son and successor was that his exchequer contained 9,000,000 thalers, and that his kingdom had attained an area of more than 45,000 square miles and a population of upward of 2,200,000. Consult: Tuttle, *History of Prussia, 1134-1740* (Boston, 1884); Förster, *Geschichte Friedrich Wilhelms I.* (Potsdam, 1835); Carlyle, *History of Friedrich II., called Frederick the Great* (London, 1858-65).

FREDERICK WILLIAM II. (1744-97). King of Prussia from 1786 to 1797. He was the son of Prince Augustus William of Prussia, the brother of Frederick the Great, and was born September 25, 1744. During his reign Prussia declined, owing to his indolence and lack of political sagacity. He gave himself up to sensuality and to the mystic vagaries of the Rosicrucians. He contracted four marriages, besides making no secret of his relations with the Countess Lichtenau. His good nature led him to abrogate taxes which the country could hardly spare; a futile expedition into Holland, in support of the Stadtholders, cost him 6,000,000 thalers; and his efforts, in conjunction with Austria, to uphold royalty in France, resulted, after a war lasting from 1792 to 1795, in the cession to France, by the Treaty of Basel, of the Prussian territories west of the Rhine. Frederick William II. shared in the second and third partitions of Poland (1793, 1795), by which Prussia received large accessions of territory. Consult Treitschke, *Deutsche Geschichte im XIXten Jahrhundert* (Leipzig, 1878-95).

FREDERICK WILLIAM III. (1770-1840). King of Prussia from 1797 to 1840. He was the son of Frederick William II., and was born August 3, 1770, at Potsdam. On his accession in 1797 he dismissed the favorites of the preceding reign, and entered upon a tour of inspection through the numerous provinces of his kingdom, for the purpose of investigating their condition. But though Frederick William was well intentioned, he lacked the force of will to cope with the difficulties of his position. By his efforts to maintain an attitude of neutrality in the great European struggle following upon the French Revolution, he awakened the distrust of the powers of Europe, and disappointed the petty German princes, who had looked upon Prussia as their protector against French aggression. In the reconstitution of the German Empire after the Peace of Lunéville (1801), Prussia acquired the sees of Hildesheim, Paderborn, and Münster, as a compensation for her territories west of the Rhine wrested from her by France. The repeated and systematic insults of Napoleon, who despised Frederick William while he professed to treat him as a friend, roused the spirit of the nation, and the King saw himself obliged to agree to a convention with Russia, the real object of which was to drive Napoleon out of Germany. But when Napoleon marched against Austria in 1805, Frederick William remained inactive. After the battle of Austerlitz (December, 1805), he even entered into a convention with Napoleon, by which Prussia gave up Anspach, Bayreuth, Cleves, and Neuchâtel, and received more than their equivalent in Hanover, wrested by Napoleon from the English dynasty. The affronts of Napoleon were redoubled after this fresh proof of Frederick William's indecision. The Prussian nation, headed by the Queen, the beautiful Louisa of Mecklenburg-Strelitz, now called loudly for war, and the King yielded. The Prussian Army was annihilated in the battles of Jena and Auerstädt, fought on the same day (October 14, 1806), and the French overran the kingdom. The Russian armies advanced to the aid of Prussia. The indecisive battle between the Allies and the French at Eylau (February 7, 8, 1807) was followed by the victory of Napoleon over the Russians at Friedland (June 14), which left Prussia at the

mercy of the conqueror. In the Treaty of Tilsit, July 9, 1807, Prussia was almost dismembered, being forced to give up her possessions west of the Elbe and the Polish dominions acquired in 1793 and 1795. During the next few years Prussia remained almost effaced as a European power, and Napoleon seized every opportunity of humbling Frederick William. But during this period of humiliation the King and his people were quietly undertaking the task of regeneration. The utmost energy was displayed in every branch of the administration. Frederick William's great Minister, Stein, emancipated the serfs and inaugurated local self-government in the towns. Scharnhorst and Gneisenau reorganized the army, training in secret three times as many men as were allowed by treaty with Napoleon. The disastrous termination of Napoleon's Russian campaign was the turning-point in the fortunes of Prussia. At the beginning of 1813 the German people rose in arms against France, Frederick William entering into an alliance with Russia. Napoleon was victorious at Lützen and Bautzen, May, 1813. Austria now took up arms against France, and the battle of Leipzig, October, 1813, achieved the liberation of Germany. Prussia joined in the invasion of France, and her armies entered Paris. The Congress of Vienna restored to Prussia a great part of her former possessions, and among her acquisitions were half of the Kingdom of Saxony and large territories in the Rhineland. The part played by Blücher at Waterloo determined Prussia's rank among the great military powers of Europe. The Prussian people, however, were doomed to disappointment in the erection of a new era of liberal government. In 1815 Frederick William joined Czar Alexander I. and the Emperor Francis of Austria in the formation of the Holy Alliance, the chief object of which soon showed itself to be the maintenance of absolutism. The Prussian King played into the hands of Metternich, who directed the policy of the Holy Alliance. Frederick William III., however, did much for the material advancement of his realm. In his reign the Zollverein, or customs union, was established, which at the time of his death included the bulk of the German States, exclusive of Austria. He died June 7, 1840. Consult: Treitschke, *Deutsche Geschichte im XIXten Jahrhundert* (Leipzig, 1886-95), especially vol. i. See GERMANY; PRUSSIA; GNEISENAU; STEIN; SCHARNHORST.

FREDERICK WILLIAM IV. (1795-1861). King of Prussia from 1840 to 1861. He was the son of Frederick William III., and was born October 15, 1795. He received a careful education, and was fond of the society of learned men. He ascended the throne June 7, 1840. He exhibited much of his father's vacillation and instability of purpose; and although he began his reign by granting minor reforms and promising radical changes of a liberal character, he always, on one plea or another, evaded the fulfillment of these pledges. He had high but vague ideas of 'the Christian State,' and showed through life a strong tendency to mystic pietism. Equally vague was his dream of a Germany united under a 'college of kings' ruling by divine right. A step in the direction of popular government was taken in 1847 by the convocation of the so-called 'United Diet,' whose activity, however, was to be

merely that of an advisory body. The February Revolution in France in 1848 was followed by an outbreak in Prussia which shook the throne of the Hohenzollern to its foundations. On March 18 the people of Berlin rose in arms. To save his crown, the King yielded to the demand for constitutional reform. In May a national Constituent Assembly met, at the same time that the Frankfort Parliament assembled to reorganize the political system of Germany. On February 26, 1849, the new Prussian Chambers met, but the constitutional régime thus inaugurated was granted merely as the King's free gift, to be modified at his pleasure. On March 28, 1849, the Frankfort Parliament offered the Imperial crown of Germany to Frederick William, but he declined it. (See GERMANY.) In the meanwhile the King had been forced, in 1848, by the clamor of his subjects, to take up arms in support of the people of Schleswig-Holstein in their revolt against Denmark, but Prussia soon abandoned the cause of the duchies. After the complete cessation of the revolutionary movement in Germany, the reactionary régime was in full sway. The 'pietists' regained their former influence at Court, and the freedom of the press and of religious and political opinion was strictly circumscribed. In 1857 Frederick William was seized with intermittent attacks of insanity, and in 1858 he resigned the management of public affairs to his brother and heir, Prince William, who acted as regent of the kingdom till his accession, on the death of Frederick William, which occurred January 2, 1861. Consult Biedermann, *Dreissig Jahre deutscher Geschichte* (Breslau, 1896).

FREDERICK WILLIAM I. (1802-75). Elector of Hesse. He was educated at Marburg and Leipzig, and became co-regent in 1831, and Elector in 1847. He sided with Austria during the War of 1866, and his refusal to accede to the terms of Prussia led to the invasion of his territory. In consequence of his obstinate refusal to treat with the Prussian Government, he was arrested and conveyed to the fortress of Stettin, and his territories were annexed by Prussia.

FREDERICK, CHRISTIAN AUGUST (1829-80). Duke of Schleswig-Holstein-Sonderburg-Augustenburg, and claimant to the duchies of Schleswig and Holstein. He was born on the island of Alsen, and was educated at Bonn. After the unsuccessful revolt of Schleswig-Holstein against Danish rule, the ducal family was banished. Frederick enjoyed great popularity with the people, however, and when, after the war of 1864, the rule of Denmark in the duchies was terminated, he triumphantly entered Kiel, where he was eagerly welcomed. Numerous political complications now arose which prevented the formal reinstatement of the dynasty. By the terms of the Treaty of Vienna (October, 1864), the duchies had been relinquished to Prussia and Austria, to be disposed of by them. Prussia, however, was not inclined to permit the creation of a new German State, and imposed conditions upon Frederick which made it impossible for him to assume the government. After the Peace of Prague, which terminated the Austro-Prussian War of 1866, the lands were finally absorbed into the Kingdom of Prussia. Frederick subsequently served on the staff of the Crown Prince, Frederick William of Prussia, during the Franco-German War of 1870-71. His

daughter, Augusta Victoria, became the wife of Emperor William II. of Germany.

FREDERICKSBURG. The county-seat of Gillespie County, Texas, 80 miles west of Austin and 25 miles north of Comfort, the shipping point, on the San Antonio and Aransas Pass Railroad (Map: Texas, E 4). Stock-raising and farming are the leading industries, and there are some manufactures. A German colony founded Fredericksburg in 1846. Population, about 1800.

FREDERICKSBURG. A city in Spottsylvania County, Va., 60 miles north of Richmond; on the Rappahannock River at the head of tide-water, and on the Potomac, Fredericksburg and Piedmont and the Richmond, Fredericksburg and Potomac railroads (Map: Virginia, G 3). The city lies in a valley inclosed by high hills, and has a public library, several bridges across the river, a beautiful park, and the famous Stonewall (Confederate) and National cemeteries, the latter having 15,300 graves. It is the seat of Fredericksburg College (Presbyterian) opened in 1893. A dam above the city, 900 feet long and 18 feet high, affords valuable water-power; and there are manufactures of flour, silk and woolen goods, iron, shoes, shirts, pickles, cigars, sumac, carriages, wheels, hubs, spokes, tanned leather, and excelsior. Fredericksburg is governed under a revised charter of 1871 which provides for a mayor, elected biennially, and a unicameral council. The city owns and operates its water-works and gas and electric-light plants. Population, in 1890, 4528; in 1900, 5068. On the site of Fredericksburg, Captain John Smith fought a skirmish with the Rappahannock Indians in 1608. The town was named in 1727 in honor of the Prince of Wales, and was incorporated in 1782. It was the home of Gen. Hugh Mercer, killed in the battle of Princeton, and of the Revolutionary officers George Weedon, William Woodford, and Gustavus B. Wallace. An imposing monument has been erected in honor of Washington's mother, who died here in 1789. During the Civil War Fredericksburg changed hands several times, and was the scene of several battles. See FREDERICKSBURG, BATTLE OF; and CHANCELLORSVILLE, BATTLE OF.

FREDERICKSBURG, BATTLE OF. An important battle of the Civil War in America, fought on December 13, 1862, at Fredericksburg, Va., between the Federal Army of the Potomac, numbering about 116,000, under General Burnside, and the Confederate Army of Northern Virginia, numbering about 78,000, under General Lee. On November 15th Burnside, who, on November 7th, seven weeks after the battle of Antietam, had superseded McClellan as commander of the Army of the Potomac, then stationed near Warrenton, Va., started down the left bank of the Rappahannock with the intention of crossing at Fredericksburg, where he expected General Halleck to have pontoon bridges in readiness, and of marching thence on Richmond. The Right Grand Division under Sumner arrived at Falmouth, near Fredericksburg, on the 17th, but could not effect a crossing, owing to the absence of bridges, and was accordingly stationed on Stafford Heights, opposite Fredericksburg. Hooker and Franklin, commanding the Centre and Left Grand Divisions, arrived soon afterwards. Meanwhile, Longstreet, acting under orders from Lee, hastened to Fredericksburg by forced marches,

reached there on the 21st, and immediately took up a position on the hills back of the town, which he proceeded with great energy to fortify. Jackson's corps arrived from the Shenandoah Valley about November 30th, and Jackson assumed command of the right of the Confederate army, the whole Confederate line ultimately extending for more than six miles, though it was broken in several places by streams and ravines. Burnside was not ready to cross the Rappahannock until December 11th, and on that day and the 12th the Right and Left Grand Divisions succeeded in passing to the other side, though the former, which crossed directly in front of Fredericksburg, met with considerable opposition from Confederate sharpshooters concealed in a cluster of brick and stone houses on the opposite bank. Hooker's Centre Grand Division crossed on the morning of the 13th, and was broken up to assist the Right and Left. After much hesitation and vacillation, Burnside, bewildered and confused by a task far transcending his ability, finally decided upon a plan of battle, in accordance with which, about noon on the 13th, Franklin, facing Jackson at the weakest point of the Confederate line—their extreme right—ordered Meade forward, with a single division, supported by two other divisions under Gibbon and Doubleday, to seize one of the opposing heights. Meade succeeded in penetrating the Confederate line, but along with Gibbon was soon forced back; so that this movement, which was the only one made by the Federal left, resulted in nothing but loss. Meanwhile, on the Federal right, Sumner six times attacked the almost impregnable Confederate works on Marye's Hill, but was each time driven back with terrific loss, the Federal troops, however, displaying in each attack wonderful steadiness and gallantry. The hill itself was heavily fortified. At its base, and parallel to the line of battle, ran a sunken road protected by a stone wall, behind which a large force of Confederates was stationed; and the approach was such as to expose an attacking force to an irresistible rain of shot and shell. At the end of the day's fighting, the Federals had lost in killed, wounded, and missing 12,653; the Confederates, 5377. Burnside contemplated repeating his attack on the following day, but was dissuaded by his officers, and withdrew unmolested to the left bank of the river on the night of the 15th. Consult: *Official Records*, vol. xxi.; Johnson and Buel (editors). *The Battles and Leaders of the Civil War*, vol. iii. (New York, 1887); Ropes. *The Story of the Civil War*, vol. ii. (New York, 1898); Palfrey. *The Antietam and Fredericksburg* (New York, 1882); Nicolay and Hay. *Abraham Lincoln: A History*, vol. vi. (New York, 1890); Allan. *The Army of Northern Virginia in 1862* (Boston, 1892); and Henderson. *Campaign of Fredericksburg, November-December, 1862* (London, 1886).

FREDERICQ, frâ'de-rêk. PAUL (1850—). A Flemish historian, born at Ghent. He was educated at Liège, and was appointed to the chair of history at Arlon, Liège, and Ghent, where he became a prominent leader of the national movement for the extension of the Flemish language, customs, and laws. His numerous works, which are distinguished by scholarly research and clearness of exposition, include: *De Nederlanden onder Keizer Karel*, vol. i. (1885); *Verzameling van*

stukken betreffende de pauselijke en bisschoppelijke Inquisitie in de Nederlanden (1889-96); and *Onze historische volksliederen van voor de zestiende eeuw* (1894).

FREDERICTON. A city and port of entry, the capital of York County and of New Brunswick, Canada, on the Saint John River, 60 miles north-northwest of Saint John (Map: New Brunswick, C 4). The river is navigable for large vessels to this point, 84 miles from its mouth in the Bay of Fundy; small steamers go 65 to 75 miles farther up. The city is the terminus of the Fredericton and the New Brunswick railroads. There is some manufacturing, but lumbering and trading are principally carried on. The city, built on a low point of land nearly surrounded by hills, is well laid out, and has elegant public buildings, among which are the residence of the Lieutenant-Governor, Parliament buildings, Government House, Legislative Library, exhibition building, hospital, custom-house, the New Brunswick University, the provincial normal school, a collegiate and other schools. Fredericton is the seat of an Anglican bishopric, and the cathedral is a handsome edifice. The United States has a consular agent here. Founded about 1740, the village was first called Saint Anne. After New Brunswick became a British possession, Sir Guy Carleton, the Governor, in 1785, laid out the principal streets to run parallel with the river, changed the name to Fredericton, and two years later it became the capital of the province. It was incorporated in 1849. Population, in 1891, 6502; in 1901, 7117.

FREDERIKSBERG, frân'ër-iks-bêrg. A western suburban municipality of Copenhagen, Denmark, with which it is connected by the wide Frederiksberg Allee, lined with pleasure gardens. It is a handsome residential place, with several attractive features in the beautiful park of Søndermarken, a zoölogical garden, the Ny-Carlsberg Glyptothek, an art museum, and the Frederiksberg Palace, constructed in Italian style, now used as a military college. The palace was built by Frederick IV., in the first half of the eighteenth century, and stands in a prominent hill park commanding a fine and extensive view. Population, in 1900, 76,237.

FREDERIKSBORG, frân'ër-iks-bôrg. A Danish castle, situated on a lake of the same name, on the island of Zealand, 22 miles north-northwest of Copenhagen. It was built in 1602-20, by Christian IV. of Denmark, on the site of an older building of Frederick II. It is in the Renaissance style, and since a fire in 1850 has been restored as a national historical museum, with handsome rooms, notably the knights' hall and the dining-hall. Its church was formerly the coronation place, and contains a king's oratory, with Passion paintings by Bloch.

FREDERIKSHALD, frân'ër-iks-hâld. A fortified seaport of Norway, beautifully situated on the Idefjord, at the mouth of the Tistedalselv, about 85 miles south-southeast of Christiania (Map: Norway, D 7). It has a Latin school. It exports a considerable amount of woodenware. The harbor is good, and is guarded by the fortress of Frederiksten, now of no importance, but never taken by an enemy, Charles XII. having fallen in an attempt to capture it in 1718. The town withstood a two years' siege

by the Swedes, 1658-60. Population, in 1891, 11,217; in 1900, 11,936.

FREDERIKSHAVN, frá'dër-iks-hä'v'n. A seaport town of Denmark, situated on the Cattedgat, 52 miles northeast of Aalborg (Map: Denmark, D 1). It has an excellent harbor, free from ice throughout the year. The chief imports are coal, iron, and cotton goods, while the exports consist of dairy products, beef, pork, and fish. Regular steamship lines run to the cities of Sweden, to England, and to Copenhagen. It is one of the youngest of Danish towns, having received municipal rights in 1818. Population, in 1901, 6478.

FREDERIKSTAD, frá'dër-ik-stüid. A seaport of Norway, situated at the mouth of the Glommen, 58 miles southeast of Christiania (Map: Norway, D 7). It is an important centre for the lumber trade with Germany, Holland, and France, the wood being rafted down the Glommen. It was founded in 1570, and was for a long time strongly fortified. Population, in 1891, 12,451; in 1900, 14,573.

FREDMAN, THE. A name sometimes used by the Swedish poet Karl Mikael Bellman (q.v.).

FREDONIA. A city and the county-seat of Wilson County, Kan., 91 miles east by south of Wichita; on Fall River, and on the Missouri Pacific, the Atchison, Topeka and Santa Fé, and the Saint Louis and San Francisco railroads (Map: Kansas, G 4). It is the centre of an agricultural and stock-raising district, and has a supply of natural gas. Its industrial establishments include flour-mills, brick-works, linseed-oil mill, etc. Population, in 1890, 1515; in 1900, 1650.

FREDONIA. A village in Chautauqua County, N. Y., 45 miles southwest of Buffalo; on the Dunkirk, Allegheny Valley and Pittsburg Railroad (Map: New York, A 3). It is the seat of a State normal school, and has the D. R. Barker Free Library. There is a fine village square, with two handsome fountains. At Central Park, midway between Fredonia and Dunkirk, the county fair is held. The village is in the Lake Erie grape region, and has extensive nurseries, canning establishments, and patent-medicine factories. The water-works and electric-light plant are owned and operated by the municipality. One of the oldest villages in western New York, Fredonia was settled in 1803 and incorporated in 1829. Natural gas was utilized for lighting the village as early as 1821. Population, in 1890, 3399; in 1900, 4127.

FREDRO, frá'dró, ALEXANDER, Count (1793-1878). A Polish playwright, born at Surochow, Galicia. For several years he served in the army, and at the end of that time (1814) he visited Paris and there studied the French theatre. Upon his return to Poland he produced eighteen comedies, which were played with success. He is praised for his depiction of comic types, and for the entirely national spirit of his work. His plays were collected and published in 1877, and again in 1880.—His son, JOHANN ALEXANDER (1829-91), born in Lemberg, was also a dramatic author. His plays had some success; but he was far from equaling his father. His works were published in 1881.

FREE BENCH (*francus bancus*). An ancient form of dower existing by custom, and not

by common law, in certain manors in England. The right of free bench was independent of endowment, and was a purely customary provision for the wife, who became entitled to it at once upon her husband's death, without waiting, as is still the case with ordinary dower, for its assignment by the heir. Coke says: "This right is called *francus bancus*, to distinguish it from other dowers, for that it cometh freely, without any act of the husband's or assignment of the heir" (Co. Litt. 94, b). The custom varied in different manors, the widow being entitled to the whole of her husband's lands in some, while in others she received one-half or one-third only. The right applied only to estates of inheritance held by the tenure of free and common socage, and was usually, if not always, limited to the period of widowhood and the good behavior of the wife (*dum sola et casta viverit*). See DOWER.

FREE CHURCH OF ENGLAND. See REFORMED EPISCOPAL CHURCH.

FREE CHURCH OF SCOTLAND. See PRESBYTERIANISM.

FREE CITIES (Ger. *Freistädte*). The name given to the three German cities of Hamburg, Bremen, and Lübeck, which are sovereign States and members of the German Empire. Since the middle of the fourteenth century the term 'free cities' has been used for certain German towns, but not always with the same meaning. The designation was applied: (1) To cities in the Rhine Valley (Cologne, Mainz, Worms, Speier, Strassburg, Basel) and elsewhere which had been under the control of bishops, but had become almost independent in the course of the thirteenth and fourteenth centuries. They enjoyed even greater freedom than the so-called 'Imperial' cities. All of these cities have become parts of the larger political divisions. (2) To the Hanse cities—Frankfort-on-the-Main, Hamburg, Bremen, and Lübeck. These cities were wealthy, and became centres of active popular life and of free institutions in the thirteenth, fourteenth, and fifteenth centuries. They maintained their freedom until the time of the Napoleonic wars. By the Congress of Vienna, in 1815, they were restored to their former rights as free cities. Hamburg, Lübeck, and Bremen still retain their privileges under the reconstituted German Empire; but Frankfort was annexed to Prussia in 1866. Consult: Arnold, *Verfassungsgeschichte der deutschen Freistädte* (Gotha, 1854); Hüllmann, *Städtewesen des Mittelalters* (Bonn, 1826-29).

FREE CONGREGATIONS (Ger. *freie Gemeinden*). An association of German rationalists. It originated in Saxony, in 1841, where the members were called 'Protestant Friends' and 'Friends of Light.' The immediate occasion was an attempt to discipline a Magdeburg preacher who had expressed heretical views. Early leaders in the movement were Leberecht Uhlich (q.v.) and Gustav Adolf Wislicenus (q.v.), both of whom were forced out of the Evangelical Church for expressing liberal views. In like manner, independent congregations arose in a number of places, and in 1847 a union was effected between them on the basis of a simple profession of faith in God. By this time their gatherings, held symbolically in the open air, had come to number more than two thousand, including delegates from England and America. In 1850 they

were united with the German Catholics (q.v.), and in the same year and the years immediately following some forty congregations were established in the United States, but had a short existence. After the revolutionary movements of the middle of the century several of the German governments undertook to suppress them, partly for political reasons. Many congregations were broken up. Those still in existence in 1859, about fifty in number, under Uhlich's leadership, formed a 'Union of Free Congregations in Germany,' upon a highly rationalistic basis. Inasmuch as the fullest individual liberty is allowed, the belief of members and congregations varies greatly. There has been a tendency toward radical free thought and some even deny the existence of a personal deity. The association is strongest in Berlin, Breslau, and Magdeburg. Its numbers and influence have gradually diminished. Consult: Uhlich, *Handbüchlein der freien Religion* (Magdeburg, 1859); Kampe, *Geschichte der religiösen Bewegung der neuern Zeit* (Leipzig, 1852-60); *Freidenker-Almanach* (Gotha, annually).

FREEDEN, frä'den, WILHELM IHNO ADOLF von (1822-94). A German mathematician and expert on navigation, born at Norden, Hanover, and educated at Bonn and Göttingen. He was director of the school of navigation at Elsfléth, Oldenburg, and later became established at Hamburg, where, in 1867, he founded the German Naval Observatory, which he conducted until 1875. The purpose of this institution is to promote and to facilitate maritime intercourse. It comprises the department of maritime meteorology; a bureau of nautical, meteorological, and magnetic instruments; the department of coast meteorology and signal service; and a bureau for testing chronometers. Freeden, who was a member of the Reichstag from 1871 to 1876, founded, with H. Tecklenborg-Bremen, the publication entitled *Hansa, Zeitschrift für Seewesen*, which he edited until 1891.

FREEDMEN'S BUREAU. A 'Bureau of Refugees, Freedmen, and Abandoned Lands,' established in the War Department of the United States by the statute of March 3, 1865. This act provided that the bureau was to be maintained through the war and for one year thereafter, and that it should have "the supervision and management of all abandoned lands, and the control of all subjects relating to refugees and freedmen," under "such rules and regulations as may be presented by the head of the bureau and approved by the President." Especially important was the provision authorizing the President to appropriate for the use of freedmen the confiscated and abandoned lands within the Southern States, not more than 40 acres for a period not longer than three years being assigned to each man thus aided. Provisions, fuel, and clothing were, moreover, to be distributed free of charge by the bureau to destitute freedmen and loyal refugees. The administration of the bureau was placed in the hands of a chief commissioner and his deputies, and in the actual application of the statute much was done with reference to labor, clothing, fuel, provisions, and schools for the beneficiaries of the plan. A second Freedmen's Bureau bill was passed by Congress, February 6, 1866, but was vetoed by President Johnson and was not passed over his veto. Later,

however, there was passed over the President's veto the act of July 16, 1866, which extended for two years the term of the bureau's statutory life, increased its powers, authorized the sale for educational purposes of Confederate public property, and gave to the bureau military jurisdiction over infringements of civil rights secured by the act. In June, 1868, another bill was passed, extending the term of the bureau for one year in unreconstructed States. The bureau's chief work ended on January 1, 1869, and its educational work was concluded a year and a half thereafter. More than \$15,000,000 was spent by the bureau, and, in addition to the general relief afforded, it aided appreciably in the movement for the higher education of the freedmen which resulted in the founding of such institutions as Atlanta University, Fisk University, and Howard University, the last being named after the chief figure in this work, the commissioner of the bureau, Gen. Oliver O. Howard (q.v.). Widely differing opinions have been, and are, held with regard to the methods used and the results attained by the bureau, some writers maintaining that its work was almost wholly beneficent, others that on the whole much more harm was done than good. The text of the first Freedmen's Bureau bill may be found in 13 *Statutes at Large* (38th Congress); that of the second in 13 *Statutes at Large* (39th Congress). For an account of the bureau's work, consult General Howard's report for 1869, published among the executive documents of the House of Representatives, Forty-first Congress, second session. Also consult "The Freedmen's Bureau," in *Atlantic Monthly*, vol. lxxvii. (Boston, 1901). See RECONSTRUCTION.

FREEDOM OF THE CITY. The custom, prevalent both in American and European cities, of conferring on a distinguished visitor the privileges connected with municipal citizenship. The names of such honorary citizens or burgesses are entered upon the register of municipal electors; but they are not entitled, when non-residents, or not engaged in business in the particular city and town, to exercise the municipal franchise or to be admitted to membership in the governing bodies. The practice of conferring the freedom of the city, which at present amounts to little more than an expression of esteem on the part of the public magistrates, may be traced back to mediæval times, when the principle of freedom of domicile was by no means universally recognized, and cities partook almost entirely of the nature of private corporations, admission into which was hampered by many restrictions. The most usual way of obtaining the privileges of citizenship at that time was by a long term of apprenticeship (seven years as a rule) to one of the recognized guilds, followed by an examination in the principles of the craft, and, where the candidate was successful, enrollment in the ranks of master workmen. In view of so cumbersome a process, the presentation of the freedom of the city by a special vote of the magistrates was, in fact, a substantial favor, and was granted only in cases where great wealth or renowned citizenship made a man a desirable accession to the list of burghers. See GUILDS.

FREE FUGUE. See FUGUE.

FREE GIFT. See BENEVOLENCE.

FREEHOLD. A town and the county-seat of Monmouth County, N. J., 25 miles east of Tren-

ton; on the Pennsylvania and the Central of New Jersey railroads (Map: New Jersey, D 3). It has a park in which is a fine granite monument 100 feet high, commemorating the battle of Monmouth (q.v.). The town is commercially important as a distributing centre for a farming district, and manufactures shirts and underwear, foundry and machine-shop products, rasps, bicycles, etc. Freehold was settled about 1735, when county courts first began to be held here, and for many years was known as Monmouth Court House. It was incorporated in 1869. Population, in 1890, 2932; in 1900, 2934.

FREEHOLD (Lat. *liberum tenementum*, free holding or tenement). In the classification of estates in land, any estate of inheritance or for life, held by a free tenure. It is distinguished from the copyhold (q.v.), and from the leasehold (q.v.). As thus employed it is a mere term of classification, but in its origin it was coextensive in meaning with the term fee, as signifying lands held of some lord by feudal tenure. (See **FEE**; **TENURE**.) The original freehold or fee was the life estate, and the term freehold has always been employed by law writers from Littleton down in a special and technical sense, as signifying an estate for life. But its more common use, especially in American law, is as above indicated. Under the feudal system, a free holding or freehold was such a tenement as a free vassal might properly hold. The tenure might be military or non-military, and the estate might be corporeal or incorporeal, but the holding must be for life at least, and not for a definite term of years, nor, as in the case of copyhold, at the will of the lord of whom the land was held. For a description of the various forms of freehold, see **FEE SIMPLE**; **FEE TAIL**; **LIFE ESTATE**. See also **ESTATE**; **FEUDALISM**.

FREE LANCE (Ger. *freier Landsknecht*, free land-trooper, in distinction from the Swiss mountaineers, but confused with *Lanzknecht*, lance-trooper). In the later Middle Ages, and early modern times, one of the roving companies of knights and men-at-arms who wandered from State to State, selling their services to any lord who was willing to purchase their aid. They played their most prominent part in Italy, where they were known as *condottieri* (q.v.). See **BRABANÇONS**.

FREE/LAND. A borough in Luzerne County, Pa., 40 miles south of Wilkesbarre; on the Lehigh Valley Railroad (Map: Pennsylvania, F 2). It is in a coal-mining and agricultural region, and has a foundry and machine-shops, lumber-mills, etc. Population, in 1890, 1730; in 1900, 5254.

FREE LIBRARIES. See **LIBRARIES**.

FREEMAN, MRS. The name assumed in jest by Sarah Jennings, wife of John Churchill, Duke of Marlborough, during her friendship and correspondence with Queen Anne. The name was adopted shortly after the beginning of the acquaintance in 1683. Queen Anne adopted that of Mrs. Morley.

FREEMAN, ALICE ELVIRA. See **PALMER, MRS. ALICE FREEMAN**.

FREEMAN, EDWARD AUGUSTUS (1823-92). An English historian, man of letters, and lecturer. He was born at Mitchley Abbey, Harborne, Vol. VIII. — 15.

Staffordshire, August 2, 1823, and at an early age was left an orphan. Under the care of his paternal grandmother he received education in various private schools, and after a course of private tuition, received a scholarship at Trinity College, Oxford, in 1841. In 1845 he graduated, and the same year was elected fellow of his college. In 1847 he married Miss Eleanor Gutch, daughter of his former private tutor. The following year with an accession to his private fortune he retired to Dursley, Gloucestershire, and applied himself to a life of historical study, research, and literature. With a special predilection for ecclesiastical architecture, in 1849 he published *A History of Architecture*. He contributed articles and reviews to *The Guardian*, *The Saturday Review*, and other periodicals, and also published pamphlets, all noted for their scholarship, accuracy, and correction of popular errors, which kept his name prominently before the reading public. In 1857 and 1858 he was appointed examiner in the School of Law and Modern History at Oxford, a position he again held in 1863, 1864, and in 1873. In 1860 he had removed to Somerleaze, near Wells, Somerset, where for some years he acted as county magistrate, and with political aspirations as a Gladstonian Liberal, in 1868 unsuccessfully stood as member of Parliament for Mid-Somerset. In 1863 appeared the first volume of his *History of Federal Government from the Foundation of the Achaian League to the Disruption of the United States* (a work that he left unfinished); in 1867 was published the first volume of his *History of the Norman Conquest* (6 vols., 1867-79), which established his position among English historians. He was created D.C.L. of Oxford in 1870; in 1874 received the honorary degree of LL.D. from Cambridge; and in 1880 was elected honorary fellow of his college at Oxford. For the better elucidation of his subjects he traveled extensively, visiting the places connected with the histories he was writing. In the winter of 1881-82 he visited the United States on a lecturing tour, which resulted in the publication of *Introduction to American Institutional History* (1882), *Lectures to American Audiences* (1882), and *Some Impressions of the United States* (1883). He succeeded Bishop Stubbs of Chester as regius professor of modern history at Oxford in 1884, and the same year was created honorary LL.D. of Edinburgh University. From 1886 to 1890, failing health impelled him to spend the winters of each year in Sicily, where he wrote his *History of Sicily* (4 vols., 1891-94). While traveling in Spain he died of smallpox at Alicante, March 16, 1892. Freeman was the leader of the Teutonic School of English history, and a voluminous writer. His principal work, *The History of the Norman Conquest*, in impartial, exhaustive treatment, and unimpeachable accuracy, is one of the greatest monuments of historical research, but prolixity and didacticism mar its otherwise lucid and vigorous style. It is as a political historian that he is best known. Among his writings not already mentioned are: *History and Conquest of the Saracens* (1856); *Comparative Politics* (1873-96); *Growth of the English Constitution* (1876); *The Ottoman Power in Europe* (1877); *Historical Geography of Europe* (1881); *English Towns and Districts* (1883); and *The Reign of William Rufus* (2 vols., 1882). Consult Stephen, *Life and Letters*

of *Edward Augustus Freeman* (2 vols., London, 1895).

FREEMAN, JAMES (1759-1835). An American Unitarian clergyman. He was born in Charlestown, Mass., graduated at Harvard, and in 1782 became a reader in King's Chapel, Boston. Subsequently he became a Unitarian, and induced the people of his Church to alter their prayer-book in accordance with his views. In 1787 he was ordained by his own congregation, since the Bishop refused to ordain him, and remained rector of King's Chapel (now the Stone Chapel) thirty-nine years. He was a scholarly and philanthropic man, and was one of the founders of the Massachusetts Historical Society. His was the first Unitarian church in this country. A volume of his *Sermons and Charges* was published in 1832.

FREEMAN, JAMES EDWARD (1808-84). An American painter. He was born in Nova Scotia, removed with his parents to the State of New York, and became a student in the National Academy of Design. He was made academicien in 1833, and after 1836 lived in Rome. His pictures are genre works and portraits. Noteworthy among his paintings are: "The Mother and Child" (1868); "Lucchese Peasants on the Sands of the Serchio" (1883); "The Beggars"; "Young Italy." They are carefully finished and well colored.

FREEMAN, JAMES MIDWINTER (1827-1900). An American clergyman and writer. He was born in New York City and was educated at Wesleyan University and at Mount Union College (Ohio). He entered the Methodist ministry, and in 1872 became assistant editor of various Sunday-school and tract publications of the Methodist Episcopal Church. Under the pseudonym of "Robin Ranger," Freeman wrote several books for children. His other works include: *Use of Illustration in Sunday School Teaching* (1867); *Handbook of Bible Manners and Customs* (1874); and *A Short History of the English Bible* (1879).

FREEMAN, NATHANIEL (1741-1827). An American physician and jurist, born at Dennis (Barnstable County), Mass. He settled at Sandwich (also in Barnstable County) in 1763. He studied both medicine and law, was active as a soldier during the Revolutionary period, commanded a militia regiment in the Rhode Island expedition, and from 1781 to 1791 was brigadier-general of militia. From 1795 to 1799 he was a member of Congress. He was also in the State Legislature of Massachusetts, and long a judge of probate and of the Court of Common Pleas. His reputation as a medical practitioner and as an orator was considerable. He published *A Charge to the Grand Jury at Barnstable* (1802).

FREEMAN, SUSANNA. See CENTLIVRE, SUSANNA.

FREEMAN AND FREEDMAN. In the most general acceptance of these terms, the first implies one who has inherited the full privileges and immunities of citizenship; the second, one who has been delivered from the restraints of bondage, but who, usually, is not placed in a position of full social or even political equality with him who was born free. With the Romans the equivalent for freeman (*liber homo*) comprehended all classes of those who were not slaves; but the distinction was preserved by the

application of the term *ingenuus* to him who was born free, and of *libertinus* to him who, being born in servitude, was emancipated. As the organization of Roman society survived the convulsions of the Middle Ages to a far greater extent in the towns than in the rural districts, where the institutions of feudality almost entirely superseded it, it is in the borough and other municipal corporations of Continental Europe that *freemen* still were found comprising persons inheriting or acquiring by adoption, purchase, or apprenticeship the rights of citizenship. The idea of a freeman was by no means peculiar to the Roman or Romanized population of Europe; on the contrary, it belonged to the constitution of society in all the Indo-Germanic nations. Among those branches of them commonly known as Teutonic, it was generally based on the possession of some portion of the soil. Thus in Anglo-Saxon England "the freeman was strictly the freeholder, and the exercise of his full rights as a free member of the community to which he belonged became inseparable from the possession of his holding in it." Consult Green, *The Making of England* (London, 1882). See ANGLO-SAXONS; CITIZEN; SLAVERY.

FREEMASONRY. A modern name of popular usage designating the principles of the Order of Freemasons. Formerly the word *Masonry* alone was employed, and is still used in the writings, history, and ritual of the craft. The term Freemasonry seems to have arisen from the fact that only *free* men were eligible to the Order, and that they were required to be elected with practical unanimity. The members then denoted themselves 'Free and Accepted Masons'; but the public curtailed this to Freemasons, and the order to Freemasonry. See MASONS, FREE.

FREE METHODISTS. See METHODISM.

FREE PORT (Ital. *porto franco*). A harbor where the ships of all nations may enter on paying a moderate and uniform toll, and load and unload. Free ports form depots where goods are stored at first without paying duty; these goods may then be either reshipped for export on paying a mere transit-duty, or they may pay the usual full customs of the country, and be admitted for home consumption. Free ports thus facilitate transit trade, and form, as it were, a foreign district within a State. See WAREHOUSING SYSTEM.

FREEPORT. A city and the county-seat of Stephenson County, Ill., 114 miles west by north of Chicago; on the Pecatonica River, and on the Chicago and Northwestern, the Illinois Central, and the Chicago, Milwaukee and Saint Paul railroads (Map: Illinois, C 1). It has a public library. There are railroad shops, and manufactures of organs, wagons, buggies, bicycles, wind-mills, novelties, and coffee-mills. Freeport was settled in 1835 and chartered in 1885. The government is administered by a mayor, elected every two years, and a unicameral council, Population, in 1890, 10,189; in 1900, 13,258. Here in 1858 occurred the debate between Lincoln and Douglas in which Douglas enunciated his famous 'Freeport heresy' or 'doctrine,' which was to the effect that, in spite of the Dred Scott case (q.v.), any Territory might virtually exclude the slave system by passing 'unfriendly' police laws incompatible with its existence. This doctrine alienated many of Douglas's former supporters, and greatly

weakened him in the Presidential campaign of 1860.

FREEPORT, Sir ANDREW. One of the members of the fictitious 'Spectator Club,' in Addison's *Spectator*.

FREEB, PAUL CASPAR (1862—). An American chemist, born in Chicago, Ill. He graduated at Rush Medical College in 1882, and studied in Germany, taking his Ph.D. degree at the University of Munich in 1887. In 1889 he became professor of general chemistry at the University of Michigan. Besides contributions to scientific publications, he is the author of *A General Inorganic Descriptive Chemistry* (1896).

FREE SCHOOLS. See COMMON SCHOOLS.

FREE SHIP. See ARMED NEUTRALITY, THE; DECLARATION OF PARIS.

FREE'SIA. A genus of bulbous plants of the natural order Iridaceæ, natives of the Cape of Good Hope, which during the closing quarter of the nineteenth century became widely popular as greenhouse and window-garden plants for winter blooming. The leaves are long and grass-like; the long scape, bent at an angle, bears at the top five or six pale-yellowish or white erect tubular flowers of exquisite fragrance. Perhaps the freesia is the easiest and most satisfactory bulbous plant to grow, since it requires even less attention as to soil and watering than the hyacinth, and unless kept too dry, or watered too heavily, will produce flowers without forcing in from six to eight weeks. The principal producing centres of freesias are the Channel Islands, California, and Bermuda, where the finest bulbs are said to grow. For illustration, see Colored Plate of IRIS.

FREE-SOIL PARTY, THE. The name of a political party in the United States, which was formed in 1848, and became merged in the Republican Party in 1856. The activity of the Abolitionists (q.v.) throughout the decade of the thirties, the energetic though indirect championing of the equal rights of all men by conservative leaders, such as John Quincy Adams, and the controversy over the extension of slavery in connection with the admission of Texas, brought the question of the further extension or the restriction of slavery once more into the foreground in 1844, although both of the existing parties, Democrats and Whigs, virtually refused to recognize the existence of any such question. Within the Northern wing of each party there arose, therefore, groups of workers, such as that led by S. P. Chase in Ohio, who aimed to commit their party to the principle of opposition to the further extension of slavery in the national Territories. The issue was forced by the introduction, in the House of Representatives, of the so-called 'Wilmot Proviso' (q.v.) in 1846 by David Wilmot, a Democratic member from Pennsylvania, as an amendment to a bill in Congress making an appropriation to negotiate peace with Mexico. The proviso passed the House, but failed in the Senate. Particularly in Massachusetts was a vigorous effort made to make the Whig Party a free-soil party, and the bitter contest between the 'Conscience' Whigs and the 'Cotton' Whigs enforced upon the former the fact that for them there was no place within their old party, and that in order to establish their principle, they must found a party whose dominant purpose

should be opposition to slavery extension. The necessity for this was still further emphasized by the refusal of both national conventions of 1848 to indorse the principle of the Wilmot Proviso; and so in August of 1848 there met at Buffalo the first national convention which stood for this principle, and which comprised in its membership the 'Barnburner' Democrats of New York, who had bolted their national convention, members of the former Liberty Party (q.v.) under the leadership of Chase, and the 'Conscience' Whigs of Massachusetts, led by Charles Francis Adams and Charles Sumner. By this convention Van Buren and Adams were named as the national ticket, and resolutions were adopted which concluded: "That we inscribe on our banner 'Free Soil, Free Speech, Free Labor, and Free Men,' and under it will fight on and fight ever, until a triumphant victory shall reward our exertions." Although the ticket received no electoral vote, and only 291,263 popular votes (sufficient to turn the scale in favor of Zachary Taylor as against Lewis Cass), the party secured such local advantages that it was able to send Chase to the Senate in 1849, and Sumner in 1851. On the other hand, the alliance with the 'Barnburners' was only temporary, and in the election of 1852 the Free-Soil candidate, John P. Hale of New Hampshire, received only 157,685 votes. In that year many Northerners were reconciled to their original parties by the 'finality' planks, and by the hope of thus preventing any further discussion of slavery extension. When this hope was proved to be ill-founded, by the Kansas-Nebraska struggle, old party lines were broken, and the principles of the Free-Soil Party were in large part adopted by the newly formed Republican Party. See LIBERTY PARTY; REPUBLICAN PARTY.

FREE SONS OF ISRAEL, INDEPENDENT ORDER OF. A Jewish fraternal and benevolent society, with headquarters in New York City, founded on January 10, 1849. It has three grand lodges and 103 subordinate lodges, distributed throughout the United States, and had in 1902 a total membership of some 11,000. At the same time it had a reserve fund of over \$860,000, and had since its organization paid to widows and other beneficiaries \$3,300,000, and by lodges for benefits \$3,150,000.

FREESTONE. A stone that is easily quarried and shaped. Sandstones and limestones possess these qualities in the highest degree, being found in stratified beds which are usually divided into blocks of convenient size by horizontal and vertical planes. When fresh from the quarries they are generally soft and can be sawn or chiseled without difficulty. The Berea sandstone and Bedford limestone are good examples of freestone.

FREETHINKER. One who forms his theological or religious beliefs by the exercise of his own reason, instead of accepting them on authority. The term came into common use early in the eighteenth century, after the publication of Anthony Collins's *Discourse of Freethinking, occasioned by the Rise and Growth of a Sect called Freethinkers* (London, 1713), and was applied particularly to the English Deists. (See DEISM.) It has been used to designate rationalists, infidels, or skeptics.

FREETOWN. The capital of the British West African colony of Sierra Leone, situated

on the left bank of the Sierra Leone River, about five miles from the coast and 33 miles by rail from Songotown (Map: Africa, C 4). It lies in a low marshy spot and is separated from the interior by a mountain chain. It is the headquarters of the British forces in West Africa, and a second-class Imperial coaling station, and has a fine harbor protected by several batteries of heavy modern ordnance. There are a cathedral, a Governor's palace, a Supreme Court, and a mission house. There is a considerable export trade in india-rubber, palm oil, gums, nuts, and hides; gold and silver ornaments, and filigree work, are skillfully made by native experts. Population, in 1901, 30,033, including only about 200 Europeans.

FREE TRADE. As first used in English literature, the term 'free trade' designated trade open to all merchants, as distinguished from that monopolized by chartered trading companies. In course of time restrictions other than monopolies attracted attention, and the term was extended to cover trade unhampered by any sort of governmental regulation. It was even used by some writers in a sense practically synonymous with 'free competition.' During the eighteenth century customs duties became the favorite mode of trade restriction, and 'free trade' became trade carried on in defiance of customs regulations. The free-traders of this period were the class we now call smugglers. At present 'free trade' designates trade that is either entirely unrestricted or restricted only in ways that afford no protection (q.v.) to home industries. The former exists only in the imagination of economists, as no government has ever attempted to put it in practice. The latter, on the other hand, is actually realized in the policy of the United Kingdom. It is to it, rather than to absolutely free trade, that the present article refers.

Although advocates of freedom of trade were not lacking in Europe before the eighteenth century (e.g. De la Croix, in France, in 1623, and Nicholas Barbon, in England, in 1696), it was not until then that any considerable number of persons of influence declared themselves for such a policy. The honor of having led in the crusade against the restrictions of the mercantile system, which was begun about 1750, belongs to the group of French writers called Physiocrats (q.v.). By them free trade was for the first time presented as an essential principle of a well-rounded system of economics. Moreover, it was through a Physiocrat (Gournay) that currency was given to the since famous phrase, "*Laissez-faire, laissez-passer*" (Let people do as they please; let goods pass freely); and through another (Turgot, the Finance Minister of Louis XVI. in 1774) that an effort was made to put in practice the leading doctrine of the school by establishing free trade in grain throughout France.

At the same time that the Physiocrats were formulating their doctrine in France (1752-63), Adam Smith was proving to his students at the University of Glasgow that the restrictions on trade, which were universal in Europe at this period, were obstacles rather than aids to a country's industrial progress, and that freedom of trade was the policy best adapted to promote the general interest. Subsequently, while sojourning in Paris, Adam Smith made the acquaintance of some of the leaders of the Physiocratic school,

and was doubtless confirmed in his opinions by what he learned of their views.

The distinguishing merit of his famous *Wealth of Nations*, regarded as a contribution to the literature of free trade, was that it showed exhaustively the evil results due to each kind of trade restriction advocated by the Mercantilists. To this part of his task Adam Smith devoted six of the nine chapters of his fourth book, and his treatment of 'protective import duties,' of 'drawbacks,' of 'bounties,' of 'treaties of commerce,' and of 'colonial restrictions' was so convincing that it did even more than the positive arguments in favor of free trade, contained in other parts of his work, to discredit the policy of trade restriction, which in 1776 still commanded the support of nearly all classes. But changes were at work, even as Adam Smith wrote, which were destined to convert many of the very merchants and manufacturers of whom Adam Smith despaired to the doctrine which he advocated.

The first prominent statesman to show the influence of Adam Smith's teaching was William Pitt, the younger. To him is ascribed the clause in the Act of Union with Ireland (1800) providing for complete freedom of trade between the two countries after 1820. Although this provision was not carried out, free-trade opinion had made such progress by the latter year that the merchants of London, headed by Thomas Tooke, presented a petition to Parliament in favor of revising the tariff in the direction of freer trade. An important factor in bringing about this result was the corn-law controversy carried on between the well-known economists Malthus and Ricardo in 1814-15, and the publication in 1817 of the latter's *Principles of Political Economy*. Ricardo put the theoretical argument in favor of free trade in a clearer and more convincing form than had Adam Smith. Furthermore, he enjoyed the advantage of being known as a practical and very successful man of business, rather than as a mere closet philosopher.

Official recognition of the growing influence of free-trade sentiment was accorded in 1823 by the appointment of William Huskisson to the presidency of the Board of Trade. Through his initiation Parliament passed several important statutes from 1823 to 1828 mitigating the severity of the navigation acts, reducing the number of dutiable articles, and scaling down the rates on those which continued to be taxed. The reform of Parliament in 1832, and of the Poor Law in 1834, diverted attention temporarily from the tariff question; but a crop failure in 1836 again brought the corn duties prominently to the front. Early in 1837 an Anti-Corn Law Association was formed in London by men prominent in public life. The following year a similar association was organized in Manchester, and in 1839 these associations, and others which had been formed in different parts of England, were fused into the National Anti-Corn Law League. From that year until 1846, when the repeal of the corn laws was definitely entered upon, agitation for free trade was carried on continuously, and with ever-increasing enthusiasm and confidence. The leaders in the movement were Richard Cobden and John Bright, representatives of the manufacturing interests of Manchester. It was this circumstance which gave rise to the custom, still common in Germany,

of applying the designation 'Manchester School' to the English advocates of free trade, who are credited with more extreme *laissez-faire* views of government than even Cobden and Bright really entertained. See BRIGHT, JOHN; COBDEN, RICHARD; CORN LAWS.

In truth, there was good ground for opposition to the policy of protection as practiced by England prior to 1846, quite aside from the general question of the advantages of free trade. The most galling of the protective duties were on the food materials which entered into the every-day consumption of the English laborer. Under the English land system the high prices for agricultural products which resulted from the grain duties redounded almost entirely to the benefit of the land-holding aristocracy. The laboring masses had to pay more for bread than was paid in neighboring countries, in order that the land-holding class might enjoy high rents. Mean-time manufacturers had to pay wages adjusted to the high cost of living, and see themselves outstripped in foreign markets by the rival manufacturers of other countries who bore no such burden. It was hard to make such a policy seem either wise or just in a country which was coming to depend more and more for its prosperity upon the success of its manufacturing industries. In fact, the system was doomed from the time that the Reform Act of 1832 gave representation in Parliament to the manufacturing towns of the north, and the country needed only a clear demonstration of the way in which the grain duties actually worked to induce it to demand their abolition. This demonstration was given in 1845, when the potato famine in Ireland cut off one important article of diet, and the grain duties were seen to stand like a dead wall between the starving masses of Great Britain and the abundant food supplies to be had from the Continent. At this crisis Sir Robert Peel, who had long acknowledged free trade to be the goal toward which the policies of all countries should be directed, refused to stand out longer against the demands for repeal. He was unable to carry his colleagues in the Ministry with him, but was soon recalled to form a new Cabinet, under which, after a long fight, the obnoxious duties were reduced and their ultimate abolition was brought about by the act of Parliament of June 26, 1846. The present policy of complete non-protection was introduced in 1869.

The following table indicates the progress in the reduction and simplification of the British tariff made from 1787 to 1876:

YEAR	Principal articles dutiable	Minor articles dutiable	Total articles dutiable
1787.....	290	1135	1425
1826.....	432	848	1280
1841.....	564	488	1052
1849.....	233	282	515
1855.....	153	261	414
1861.....	19	123	142
1876.....	10	32	42

In November, 1902, there were twelve distinct articles on the dutiable list—viz. cocoa, coffee, chicory, dried fruit, molasses, sugar, tea, tobacco, wine, beer, glucose, and spirits.

The present policy of England realizes the free-trade ideal of imposing no duties that can tend

to protect or encourage home industries by means of the following expedients:

(1) Most of the dutiable goods (e.g. coffee, tea, cocoa, wine, etc.) are such as cannot, for climatic reasons, be profitably produced in England.

(2) The duties on tobacco, a commodity which might be produced in England, are rendered non-protective by the simple prohibition of such production in the United Kingdom. This policy dates from the reign of Charles II., and has become so familiar as to involve little or no hardship.

(3) The duties on goods like beer, spirits, etc., which are produced in England, are exactly offset by internal-revenue duties which place the home producer in the same position, so far as taxation is concerned, as the foreign producer. The practice of storing such goods, whether produced at home or imported, in bonded warehouses, makes the administration of this policy easy. The only exceptions to the general principle that no favor shall be shown to home as distinct from foreign producers are in connection with ship subsidies for the benefit of the merchant marine, and certain slaughter-house regulations which put foreign producers of live stock at a disadvantage. The former is defended as a necessary feature of the postal system, and the latter on sanitary grounds.

Extended attention has been given in this article to the free-trade policy of England, because that nation is the only important one to follow such a system. Its example is followed by British India, Hong Kong, and the Straits Settlements. On the Continent of Europe, Holland and Belgium have tariffs that are only slightly protective. All other European countries, and all other countries outside of Europe, however, are committed to the policy of protection. It is thus not far from the truth to characterize free trade as the British policy, in distinction from protection, which is the policy of the rest of the world.

In presenting the arguments in favor of freedom of trade, we will begin with the advantages claimed for this policy, and conclude with the disadvantages attributed to the opposite policy, protection.

As Adam Smith long ago pointed out, a principal cause of the industrial progress of the world is the division of labor and the specialization and organization which accompany it. Many men, each working at a special task and sharing his products with his fellows, can produce vastly more in a given time than the same number, each trying to produce for himself all the things that he requires. But one condition of the division of labor is opportunity to exchange one's special products for the needed products of others. *Free exchange* thus gives the widest extension to the division of labor. Obstacles to free exchange prevent the would-be specialist from giving all of his time to the occupation for which he is best fitted, because they prevent him from disposing of his products advantageously, and compel him to produce a variety of things for himself, or else go without them. When such obstacles are natural—as barriers to the transportation of goods from one mountain valley to another—the situation is unfortunate, but perhaps irremediable. When they are artificial—as are the *octroi* duties which

prevent the free exchange of the products of town and country in certain European countries—they should be condemned. But the same reasons that make a free exchange of goods within a country advantageous make freedom of trade desirable. Political boundaries do not alter the essential nature of exchanges, nor the benefits that accrue to society from having them as free as possible. Foreign trade, like domestic trade, is at bottom an exchange of goods for goods, in which less-desired commodities are given for more-desired commodities, to the mutual advantage of both parties to the transaction. As different individuals are unequally fitted to carry on different pursuits, and gain an advantage by an arrangement which allows each to follow his bent, so different countries are unequally adapted for different industries. Freedom of trade, which permits the capital and labor of each country to find employment in those industries for which it is best fitted, serves to increase the aggregate output of goods in the same way that free exchange does in the case of individuals. From it there results a 'territorial division of labor,' by which each part of the world is devoted to those industries for which nature has adapted it, and through which the aggregate productiveness of the world's labor and capital is immensely increased. The chief purpose of foreign trade is to enable the world to benefit from this territorial division of labor—to permit, for example, a country like Brazil to produce coffee, not merely for its own inhabitants, but for the world; a country like Cuba to produce sugar; a country like Italy to produce olives, fruits, and silk; a country like the United States to produce corn, wheat, and the important metals. The greater the freedom of trade between countries, the greater the inducement which is held out to each to use its labor and capital in the ways calculated to contribute most to the world's wealth.

In spite of the above advantages of freedom of trade, modern countries persist in maintaining their protective systems. Advocates of free trade condemn protective duties on several grounds. Their tendency, it is urged, is to divert labor and capital from unprotected industries, where they must otherwise find investment, to the protected industry. But this must mean curtailed production. If it was desirable to invest in the protected industry, business men would have done so without any encouragement. That they needed encouragement is proof positive that the favored industry can only be carried on at a national loss. The protective duty cannot cause labor and capital to spring up out of the ground. All it can do is to influence the use to which the available supplies of labor and capital are put. These supplies set a limit to the amount of industry that can be carried on. If diverted from industries not needing protection to those requiring it, the available labor and capital must produce less in the aggregate. The policy involves, therefore, a national sacrifice. Unless good reasons for such a sacrifice are advanced, protection must stand condemned. Of course protectionists have reasons for their policy which they consider good, but to advocates of free trade they seem inadequate.

Other arguments against a protectionist policy, and therefore in favor of free trade, are begin-

ning to be urged in the United States. First, protection is condemned on political grounds. Its tendency is to rear up a group of favored industries. Business men interested in these industries have a special inducement to watch tariff measures which others in the community lack. They are too apt, under these circumstances, to become lobbyists and corruptionists. Through them representatives, charged with shaping the tariff policy, are subjected to influences from which legislators ought to be exempt. Secondly, protection is accused of being in practice a policy of change. To be effective protective duties must adapt themselves to changing industrial conditions. But changes are always disturbing to business, and at times disastrous. Free trade, by making no discrimination between the home and the foreign producer, does not subject business to arbitrary fluctuations. Third, protection is criticised on financial grounds. Since the purpose of a protective tariff is not primarily revenue, the income which it affords to the Government bears no regular nor constant relation to the latter's financial needs. At times it may burden the public treasury with an awkward surplus, which encourages reckless extravagance on the part of the legislature. At others it may fail to bring in even that necessary minimum without which the business of Government must be seriously interfered with. Finally, certain protective duties are attacked as responsible for the trusts (q.v.). The argument is that without protection the branches of production concerned would have been open to world-wide competition, and that no merely national trust would have served to secure the monopoly powers after which the trusts are supposed to hunger. If protection has created trusts, and trusts are undesirable, protective duties ought to be reduced, it is urged, until the offending trusts feel the wholesome restraints of foreign competition. The conclusiveness of these arguments against protection can be determined only by weighing them against the counter-arguments in favor of that policy, for which see the article on PROTECTION, and references there given.

FREE WILL. The power of choosing without external compulsion. In theology the question of free will is the question as to the nature of the will and of its action in making choices. Considered as a purely psychological question, it is as neutral as the question as to the nature

and action of the affections, or of the process of syllogistic reasoning. But it is in the will that personality is viewed as centring; and since responsibility for action is ascribed to every person, it is in the will that this responsibility is conceived to reside. Choice is also the essential element of every right and every wrong action; and hence sin, its nature, origin, and guilt, are connected with the will and illustrated by it. Hence it would seem that a correct theory of the will is essential to correct views upon all these great subjects:

The main question may be comprehensively stated thus: The action of the will is always performed in the presence of motives. These are the objects presented for possible choice, with the reasons outside of the individual who is to make the choice for and against them, and the further reasons arising from his own inner condition and history. Is the act of choice an effect, depending in some way upon these motives, or is it an exercise of the power of primal causality residing in the man? Theories maintaining the first of these alternatives may all be classed under the general title of 'deterministic'; and the others will then be called 'indeterministic.'

1. The chief deterministic theories are the following:

(1) The theory that motives are causes operating upon the will, and that a volition is as strictly a caused event as the explosion of a pile of gunpowder. The forms of stating this theory will differ according as the philosophy of the theorist is materialistic or spiritualistic. If the former, as is the case with Herbert Spencer, the causation will be viewed as of exactly the same nature as all other causation. There is ultimately but one force in the universe and but one mode of operation, however different the individual forms may ultimately appear. Or if the latter, as was true of Edwards, the causation will be viewed as different because of the difference of the two terms connected in cases of physical and of volitional causation, not because of 'the nature of the connection.' For this theory, in all its various forms, there is ultimately but one argument, the inconceivability of an uncaused event. Edwards has no other argument. Even his famous *reductio ad absurdum*, by which he sought to confound his adversaries, is at bottom nothing else, for 'determining' an act of the will, he says, must be by another act of the will, if it is a case of 'self-determination,' which is as much as to say that, somehow, the will must be caused in every act.

No doubt the element in this theory which has made it attractive to so large a school of theologians (Calvinists quite generally have accepted it) is its ready applicability to the doctrines of the divine foreknowledge (q.v.) and government. If God foreknows all His own acts, He foreknows all the motives that will surround the first moral acts of men, and hence foreknows what those acts will be; and therefore He knows the whole series of motives that ever will operate upon men, and consequently all their volitions and all their acts. Thus also He governs men. The motives that act upon men are all, ultimately, brought to bear upon them by God, for they are all either the direct result of His own divine acts or the indirect result of the same. Since these motives govern men's volitions, God absolutely governs them. The great theological objection against this theory also arises from the same considera-

tions. True activity, responsibility, and virtue or vice, are thus removed from the creature and placed in God. The man choosing is nothing but a link in the chain of causes and effects, and has no more true agency than a billiard-ball in front of a cue. If there can be said to be such a thing as sin at all, God is its author, because the only real agent in the whole universe. Edwards repelled these objections by saying that the moral character of an act lay in its nature and not in its origin. He drew a line at the moment of volition. All that goes before volition, surrounding it with incentive and eliciting it, is of God. The act and what necessarily follows it are man's.

(2) The next theory is substantially the same as the preceding, except that it does not introduce the element of ontological explanation of the uniformity of the will's action under uniform conditions. It simply affirms that the same antecedents are invariably followed by the same consequents. Hence the action of the will can be accurately predicted by any one possessed of competent knowledge of the circumstances, and hence the reign of law in human affairs is perfectly provided for. In this form the theory was propounded by John Stuart Mill, and is essentially the theory of Kant, who taught that the 'category' of causation applied simply to phenomena. Both these writers stripped causation, as applied to the world of sensation, of all power. The great argument for Mill's theory is the fact of law in human affairs. Given a rise in the value of breadstuffs, there will be a diminution in the number of marriages and an increase in the number of suicides. In any long series of years the fluctuations in the prices and in the social events mentioned will follow each other in a perfect parallelism. Law in the phenomena of society is a fact. But the theory is objected to as not being a theory at all, but only a register of facts, and again as not conforming to the facts it professes to register. Certainly it can never be proved that any combination of antecedents ever exactly recurs, or that any consequent is precisely the same as any other.

(3) Closely allied to these views is a theory recently set forth, and quite in accord with a certain drift in modern thought, of which Prof. John Dewey may be taken as the representative. It is the theory of 'logical determinateness.' The theories already reviewed and most others are said to have been concerned about a 'self-made' question, beside the point, altogether impertinent and superfluous. They have set up a dualism between the actor and his deed which does not exist. We are to go to psychology for the actual process of choice, and in that process we shall see the truth. A child sees a bright object, let us say the flame of a candle. The infant's impulse is to seize this bright object. But when it does this the object reacts upon the child, a new impulse is aroused, and so by a process of 'mediation of impulses' there comes out a distinct line of conduct. It is a tentative process, a trying in fact or imagination of this or that to adjust it to other impulses. It is all a process of choice, for it is all activity, and activity is the will. Hence freedom is easily defined. It is such activity. "Impulse is self; the developing ideal is self; the reaction of the ideal as measuring and controlling impulse is self. The entire voluntary process is one of self-expression, of coming to consciousness of self.

This intimate and thorough-going selfness of the deed constitutes freedom." The great argument for this theory is its claim to correct psychological analysis. The objections to it are that it does not provide for any self except the bundle of concrete phenomena; that it does not correctly analyze the volitional action of the mature mind; and that it does not rise at all to the consideration of deliberate choice, such as is formed at the great moments of decisive human action. From a theological point of view, whatever objections would apply to the theory of Mill would apply to this.

II. The theory of indeterminism may be stated as simply this: That the soul possesses the power of choice between proffered alternatives; that, however it may act when it does not deliberately exercise its ultimate powers, when it does, it acts as a first cause, originating the choice and determining it not by any other act, but in and by the act of choice itself. Otherwise expressed, if the motives before the will on any two occasions were exactly the same—the word motive being understood to include all things, objective and subjective, capable of influencing the will in the choice—the choices might be different. The theory does not deny the influence of motives, the custom of the will to follow habitual lines of choice, the rationality of man and his tendency to choose what in his best judgment is most for his advantage, and the determinate effect upon the will of external conditions. It maintains that in cases of automatism the action of the will is mechanical; but it is not discussing such action. In cases of rational action it teaches that the will follows the preponderating motive not by causation arising from that motive, but by free self-causation. It may compress its statement into the form that in every case of deliberate action, supposed by the agent himself to be free, the will chooses the object, and is not chosen and controlled by the object.

The arguments for this position are all resolvable into one, that such is the testimony of consciousness. By consciousness is meant not feeling, sentiment, received opinion, but the knowledge which the mind by its own native powers has of its own action whenever it acts. When it thinks, it knows that it thinks, and knows what thinking is, discriminating it from all other activity, never mixing it with feeling. So, when the mind chooses, it knows that it is choosing, not thinking, not feeling, and it knows what it is that it does in choosing. It knows that it exercises original power, and acts as a first cause.

The theory is further supported by the ease with which it is made harmonious with the primary ethical ideas. Freedom, on the deterministic theory, can be nothing more than Jonathan Edwards allows—liberty to act as we have chosen; but I do not feel free unless I have the power of sovereign choice. If I am a link in a series of causes and effects, I have no more real responsibility than the billiard-ball has for its course. But if I do whatever I do because I have myself, apart from all compulsion, physical or spiritual, deliberately chosen, then my act is truly mine, and I am responsible for its nature and its consequences.

The great objection to this theory is that primal causality in man is inconceivable. Granting that it is conceivable in God (which some determinists have denied), it cannot be conceived in a

dependent creature like man. The advocate of indeterminism does not feel called upon to show its conceivability in the sense of showing how it has come about that man is a first cause, but contents himself with exhibiting the fact, upon the basis of the declarations of consciousness. The objection that the theory teaches that there are uncaused events is answered by saying that the volition is caused by the man, or that it is an example of the operation of original causality, and thus not uncaused. The great theological objection to this theory is its alleged failure to provide for the foreknowledge and government of God. It does certainly provide for most of the foreknowledge of God, for men's actions are very largely upon the basis of general reasonableness, even under this theory, and are hence largely predictable to fallible men, and much more so to an infinite God. God knows His own acts from all eternity, and must equally well know their consequences, among which will be the great majority of the acts of His free creatures. Some indeterminists have declared that the number of acts thus not foreknown would be infinitesimal, and so negligible. Others have given a larger play to the element of uncertainty, but have said that God foreknows all the possibilities of action, and thus is infinitely prepared for any action of men in any case. The gross exaggeration of Edwards, that indeterminism threw the whole universe into utter confusion, needs no refutation. If there were confusion it would not be important. The advantage of this theory as to the divine government is that it emphasizes the fact that the government of God over the actions of men is a truly moral government, one by persuasives and not by forces. If motives are virtual causes, there is no difference between the government of men and that of the planets.

FREE-WILL BAPTISTS, or FREE BAPTISTS. See BAPTISTS.

FREEZING-MIXTURES. Mixtures of substances used to produce low temperatures. The frigorific effect of such mixtures generally depends upon the following facts: (1) Melting, or the passage of a substance from the solid state to the liquid, involves the conversion of *sensible heat* into 'latent heat,' and if no heat is added to a melting substance from without, part of the sensible heat of the substance itself disappears, and therefore the temperature falls; (2) the solution of many salts in water causes the absorption of heat, and hence, again, if there is little or no addition of heat from the surroundings, there is caused a fall of temperature. The efficiency of the first of these causes may be seen from the

following: If a piece of ice having the temperature of 0°C . (32°F .) is placed in its own weight of water at 79°C . (174.2°F .), it is found that after the ice has melted, the temperature of the liquid is reduced to 0°C . (32°F .), much of the sensible heat which the water contained having thus disappeared during the melting of the ice. The lowering of temperature by solution is illustrated in a striking manner by the fact that ammonium sulphocyanide, if thrown into its own weight of nearly boiling water, will reduce the temperature to the point of freezing; if thrown into its own weight of water of ordinary temperature, the same salt will reduce the temperature to -21°C . (-5.8°F .). In the mixture of pounded ice and salt used in making ice-cream, the lowering of the temperature is due both to the conversion of sensible into latent heat during the melting of the ice, and to the absorption of heat during the solution of the salt. The following table shows the more important freezing-mixtures and the temperatures that may be obtained by the use of them. Supposing that there is no absorption of heat from the surroundings, the fall of temperature produced by mixing a given set of substances is determined by the amount of sensible heat absorbed (i.e. the heat of fusion and solution) and by the specific heats of the substances between the initial and final temperatures. The temperatures obtained depend, of course, upon the initial temperatures of the mixtures. The initial temperature of any mixture given in the following table, unless otherwise specified, is assumed to be the freezing-point of pure water.

FREEZING-POINT. The temperature at which a given substance can exist partly in the solid, partly in the liquid state. If, while the substance is partly solid and partly liquid, heat is added to it, some of the solid portion melts, the added sensible heat changes into 'latent heat of fusion' (see FREEZING-MIXTURES), and, as long as the solid portion lasts, the temperature remains constant. Again, the abstraction of heat can only be effected at the expense of the latent heat of the liquid portion, which is thereby gradually solidified; and hence, as long as the liquid portion lasts, the temperature remains constant. If heat is neither added nor abstracted, the solid and the liquid portion remain in equilibrium; i.e. neither does the solid melt, nor the liquid solidify. Now, as long as this equilibrium exists, the vapor-tensions of the solid and liquid portions must be precisely equal. If the vapor-tension, say, of the liquid were greater than that of the solid, a process of distillation would take place, the solid tending to increase at the expense of the liquid; but the excess of solid would immediately melt, so that the equilibrium might be reestablished; meanwhile, more of the liquid would be transformed into solid by distillation, and so on *ad infinitum*. The distillation could of course be employed for the production of mechanical work; and as it would go on at the expense of the heat from the surroundings, it might be employed perpetually for the transformation of the heat, say, of the ocean into mechanical work. Any process of this kind has been conclusively proved to be impossible. (See THERMODYNAMICS.) And as the assumption that the

SUBSTANCES (PARTS BY WEIGHT)	Temperature attained	
	Cent.	Fahr.
100 parts of snow and 33 parts of common salt.....	-21°	-5.8°
100 parts of snow and 300 parts of crystallized calcium chloride.....	-48.5°	-55.3°

Solidified carbon dioxide and ordinary ether.....	-100.0°	-148°

Substances employed as freezing-mixtures, if solid, should be finely powdered, rapidly mixed, and placed in vessels that have but little conducting power. These freezing-mixtures are only available for use on a small scale. A fact extensively utilized for the production of low temperatures on a large scale is that, like the liquefaction of solids, the evaporation of liquids, too, involves the absorption of considerable amounts of sensible heat. See EVAPORATION; REFRIGERATION; FREEZING-POINT.

vapor-tension of the liquid portion is not greater, but less than that of the solid portion, leads to a similar impossibility, we conclude, as stated above, that as long as the solid and liquid portions of a substance are in equilibrium, the vapor-tensions of the two portions must be equal. The freezing-point of a given substance may therefore be defined as the temperature at which the substance has the same vapor-tension in the solid and in the liquid state. In the case of a single chemical substance (i.e. not a mixture),

that temperature may be referred to either as the freezing-point of the liquid, or as the melting-point of the solid. Thus the freezing-point of water is the same as the melting-point of ice. In the case of solutions, however, the temperature at which freezing commences is not by any means the same as that at which, if entirely solidified, the mixture would begin to melt.

FREEZING-POINT OF SOLUTIONS. An important fact to be remembered in connection with freezing solutions is that ordinarily the pure solvent alone freezes out. It will be seen further that the freezing-point of a solution is the lower the greater the amount of substance dissolved. While, therefore, the solvent alone is freezing out, the temperature must obviously fall. Hence, if we wish to speak of the freezing-point of a solution of given strength, we must necessarily refer to the temperature at which freezing just commences; for freezing changes the composition. Experience shows, however, that unless the given solution is very concentrated, and unless the amount experimented upon is very small, a moderate quantity of the solvent may be allowed to freeze out, without the result of the observation being thereby considerably impaired. In other words, under proper experimental conditions, the difficult determination of the point at which freezing just commences is unnecessary. The freezing-point of solutions is now generally determined by the use of Beckmann's apparatus shown in the accompanying figure. The

BECKMANN'S APPARATUS.

The outer jar, C, contains some liquid whose temperature is kept rigidly constant and a few degrees below the freezing-point of the given solution, a glass stirrer serving to keep the temperature uniform throughout the volume. The wide tube, B, contains nothing but air and serves to prevent the too rapid cooling of A. In making an observation, a known amount (say, 20 grams) of the pure solvent is introduced into the strong inner test-tube, A, through the side-tube; and when freezing has set in and the thermometer shows a constant temperature, the latter is carefully noted. In this manner the freezing-point of the pure solvent becomes exactly known. Next, a known amount of the substance to be dissolved is introduced to the solvent in A, again through the side-tube; the contents of A are caused to melt by removing A from B, and when all is dissolved A is replaced in B; again, when freezing has set in and the thermometer shows a constant temperature, the latter is carefully noted. In this manner the freezing-point of the solution too becomes exactly known, and then the difference between the freezing-point of the pure solvent and the solution of known strength can be found by a simple subtraction. A great many determinations

of this nature, carried out with a great variety of substances, have led to the establishment of the following law: *The freezing-point of a solution is invariably lower than that of the pure solvent, the difference being, for the same substance, proportional to the amount, and, for different substances, not only proportional to the amounts, but also inversely proportional to the molecular weights of the substances dissolved.* A comparison of this law with the one that holds good for the lowering of the boiling-point (see **BOILING-POINT**) will show the perfect analogy between the two laws. Here, too, as in the case of the boiling-point, the simple law holds good only for substances whose solutions do not conduct electricity, matters being much more complicated in the case of solutions of electrolytes. (See **DISSOCIATION**.) In the case of solutions of non-electrolytes, determinations of the freezing-point of solutions permit of ascertaining the molecular weight of newly discovered substances; and this is the purpose for which freezing-point determinations are now mostly made. All that has to be done is to determine the freezing-points of the pure solvent and of two equally strong solutions in the same solvent: one containing the new substance, the other some substance of known molecular weight, and then the molecular weight of the given substance is found simply by the rules of proportion. The solvents most frequently employed for such determinations are glacial acetic acid, water, and benzene, acetic acid being the most useful of the three. Still, other solvents too can be and are sometimes employed. See **MELTING-POINT**; **SOLUTION**; **MOLECULES—MOLECULAR WEIGHTS**.

NERNST'S THEORY OF THE FREEZING-POINT. The determination of the freezing-point, as explained above, seemed to be a perfectly reliable operation, until experience had shown that considerably different results are obtained by using apparatus different in size and shape, by having different temperatures in the outer jar (C), and by varying the rate of stirring in the inner tube (A). In 1894 Nernst gave a mathematical explanation of this important phenomenon—important because of its connection with the theory of solutions and with the determination of molecular weights. The principle of Nernst's calculations is as follows: The temperature in the outer jar (C) is, as we have seen, kept a few degrees below the freezing-point of the given solution. If the latter did not freeze and were not stirred, heat would flow from it into the outer vessel until the temperature in A and in C would be the same. This flow of heat would take place, for a given form of apparatus, at a rate proportional, at any instant, to the difference of temperature, at that instant, between A and C. On the other hand, regular stirring would cause the formation of sensible heat in A at a constant rate. When the steadily diminishing rate of the outflow of heat from A to C becomes equal to this constant rate of production of heat in A, the temperature in A must evidently become constant. This constant temperature Nernst terms the 'convergence-point.' All this, however, presupposes that the liquid in A does not freeze. Suppose now that as soon as the solution has reached the convergence-point, freezing has set in; and suppose that in a given case the con-

vergence-point is lower than the freezing-point. During freezing, the latent heat of fusion is evolved as sensible heat, and the temperature rises, tending to approach the true freezing-point of the solution. There is experimental evidence to the effect that the rate at which the temperature thus rises is, at any instant, proportional to the distance of the temperature at that instant from the true freezing-point. In other words, the nearer to the true freezing-point, the slower the freezing, and hence the slower the variation of the temperature caused by it. But 'the nearer to the true freezing-point' means 'the farther from the convergence-point'; and we have seen that the farther from the convergence-point, the more rapid the rate of variation in the direction of that point. There must therefore exist, somewhere between the true freezing-point and the convergence-point, a point at which the rates of variation upward toward the true freezing-point, and downward toward the convergence-point, are precisely equal. That point Nernst terms the 'apparent freezing-point.' And he justly maintains that, everything being taken into account, the temperature usually observed, after variation has ceased, is not the true freezing-point, which is, of course, dependent on nothing but the nature and strength of the given solution, but the apparent freezing-point, which may obviously depend on the temperature of the outer jar, on the amount of solution experimented upon, on the rate of stirring, on the specific rate of freezing or melting of the solvent, etc. The effect of stirring is so considerable that in several cases the convergence-point has been found to lie, not below, but above the true freezing-point, in spite of the somewhat low temperature in the outer jar. In such cases, too, the apparent freezing-point is, of course, somewhere between the true freezing-point and the convergence-point. The difference between the true and apparent freezing-points is, as might be readily supposed, not very great. In fact, in many cases (e.g. in the case of common salt) it may be safely neglected. In other cases, however (e.g. in the case of weak solutions of cane-sugar), it must be taken into account if results at all reliable are to be obtained. The exact way of applying the theory in practice, with a view to ascertaining the true freezing-point of solutions, may be found described in the original memoir, by Nernst and Abegg, in vol. xv. of the *Zeitschrift für physikalische Chemie* (1894). It scarcely needs to be added that at the apparent freezing-point there is really no equilibrium between solid and liquid; that either melting of the solid portion or freezing of the liquid portion is continually going on, according as the apparent freezing-point is above or below the true freezing-point of the solution.

'CRYOHYDRATES.' We have seen above that generally the pure solvent alone freezes out of solutions, and that the freezing out of much of the solvent would cause a corresponding depression of the freezing-point. In other words, if freezing was allowed to go on to a large extent, the given solution would become more and more concentrated and the temperature would fall lower and lower. Finally the solution would become saturated. Further freezing would then naturally cause the precipitation

of the substance dissolved; the concentration of the solution would remain constant, and hence the freezing-temperature, too, would remain constant. At one time, solutions thus having a constant freezing-point were taken to be chemical compounds of the dissolved substances with the solvent, and were therefore named 'cryohydrates.' It is now clear, however, that there is no more reason for such an assumption than there is for assuming that, in general, any saturated solution is a true chemical compound. The substance freezing out of a saturated solution is nothing but a chemical mixture of the frozen solvent and the substance originally dissolved, and, of course, the melting-temperature of this mixture, being identical with the freezing-temperature of the saturated solution, is likewise constant. It is also clear that the melting-point of the 'cryohydrate' is the lowest temperature at which a solution of a given substance in a given solvent can exist. Hence, by mixing ice with salts in the proportion in which they would form 'cryohydrates,' we can obtain freezing-mixtures having the lowest constant temperature that can possibly be attained with the given salts. 'Cryohydrates' are now classed with the so-called 'eutectic mixtures.' See MELTING-POINT.

FREGENAL DE LA SIERRA, frá'há-nál' dá lá sé-ár-rá. A town in the Province of Badajoz, Spain, 50 miles south by east of the city of Badajoz (Map: Spain, B 3). It is situated in a fertile and picturesque valley among mountains, and is laid out with regular and spacious streets. There are plazas and some buildings of merit. The ancient castle, which was erected by the Templars to whom the town was granted in 1283, has been converted into a bull-ring, capable of seating 4000 persons. The town has a considerable trade in animals, and manufactures cloth, baize, hats, leather, flour, etc. Population, in 1900, 9582.

FREHER, frá'ér, MARQUARD (1505-1614). A German historian, born at Augsburg. He studied law at Altdorf and Bourges, was professor at Heidelberg (1596-1614), and was frequently sent as Ambassador to Poland and other countries by the Elector Frederick IV. He published several important historical works in Latin, among which the *Origines Palatinae*, with its interesting information on Heidelberg and other early German settlements, is, perhaps, the most important. It was first printed in 1599, and has since been frequently republished.

FREIBERG, frí'berk. An old and important town of Saxony, the centre and seat of the mining district and mining administration of Saxony, situated on the northern slope of the Erzgebirge, 25 miles by rail southwest of Dresden (Map: Germany, E 3). Freiberg retains portions of its fortifications and presents an ancient appearance. The Late-Gothic cathedral was constructed in 1490-1512, on the site of a Romanesque church, which was burned down in 1484. The southern portal, known as the Golden Door, is a relic from the ancient church. The sculptures on the door are considered among the finest of the plastic ornamentations of the Middle Ages. The church contains objects worthy of interest, among them the burial-vault of forty-one Protestant Saxon princes. The large organ was built by Silbermann. The old castle of Freudenstein, construct-

ed in 1572, and now used as an arsenal, the Late-Gothic Rathaus dating from the beginning of the fifteenth century, and the sixteenth-century Kaufhaus, with its museum of antiquities, are the prominent secular buildings of the city. Among the educational institutions are a gymnasium dating from 1515, and the famous mining academy, founded in 1765, and attended by students (about 450) from all parts of the world. The school possesses extensive geological and mineralogical collections, chemical and assay laboratories, a library, and the Werner Museum.

Freiberg has large smelting-works, foundries, and other establishments connected with mining. The mines are owned by the State, and are annually visited by many mining experts and tourists. There are manufactures of gold and silver wire, machinery, leather, woolens, fertilizers, etc. The city is well provided with schools, museums, scientific associations, and hospitals. It is lighted by gas and electricity and has an electric street railway. Population, in 1890, 28,955; in 1900, 30,175, including about 1000 Roman Catholics. The town owes its origin to the discovery of silver in the vicinity in the twelfth century. It was strongly fortified, and obtained municipal privileges about the beginning of the thirteenth century. After being subject to various rulers, Freiberg fell to the Saxon Albertine line in 1485. Consult: Gerlach, *Kleine Chronik von Freiberg* (Freiberg, 1898); *Freibergs Berg- und Hüttenwesen, herausgegeben durch den Bergmännischen Verein zu Freiberg* (ib., 1893).

FREIBURG, frī'boorĕk. The attractive capital of a district of the same name in the Grand Duchy of Baden, Germany, and the former capital of Breisgau (q.v.), situated in the charming valley of the Dreisam, about 11 miles east of the Rhine and 72 miles south-southwest of Karlsruhe (Map: Germany, B 4). The environs are exceptionally beautiful, embracing a rich plain, lovely vine-clad hills, and a portion of the picturesque Black Forest. In appearance Freiburg very agreeably combines features of an ancient and a modern city. It contains numerous specimens of mediæval architecture, and there remain portions of the old fortifications. The cathedral, a rival of the Strassburg Minster, and restored since 1880, is one of the most perfect specimens of Gothic architecture in Germany. It is of red sandstone, the Romanesque transept and the side towers dating probably from the twelfth century. The choir was not completed before the beginning of the sixteenth century. The famous tower, considered the finest of its kind in Europe, with chimes and a curious clock, is 380 feet high, and has a square base, an octagonal bell-tower, and a pyramid of open stonework. The main portal is richly decorated with allegorical figures, and the beautiful interior contains numerous excellent examples of stained glass belonging to different periods, creditable monuments, and a number of masterly altar-pieces by Hans Baldung and Holbein the Younger. Other interesting ecclesiastical edifices are the Roman Catholic Church of Saint Martin, dating from the thirteenth century, with a modern tower, and the Protestant Ludwigskirche, constructed in Romanesque style in 1829-39.

The noteworthy secular buildings of Freiburg include the sixteenth-century Rathaus, adorned with frescoes; the Kaufhaus, or Merchants' Hall,

with a vaulted portico and statues of German rulers on the outer walls; the Kornhalle, with a fine concert hall; the old university, a sixteenth-century Renaissance structure, now annexed to the Rathaus; the new university, formerly a convent; the municipal theatre; and the grand ducal palace. Freiburg is not only well provided with handsome promenades, but is rich in monuments and memorial fountains, the most prominent of the former being the monument erected to the Fourteenth German Army Corps in 1876, and the monument to Berthold Schwarz, the alleged inventor of gunpowder. The celebrated university of Freiburg, founded by the Archduke Albert VI. of Austria in 1457, has four faculties, about 95 professors, and an attendance of over 1400 students. There are attached to it a library of 270,000 volumes, and a number of collections and institutes. Besides the university, there are two gymnasia and two *Realschulen*, several special schools, museums, a theatre, and numerous scientific and art associations.

In its equipment as a modern town, Freiburg has electric lights, an electric street railway, fine water-supply, a sewage farm, and several hospitals and charity houses. The city is rather prominent in the industrial world. It is especially well known for its manufactures of silk thread, glass, and pearls. There are also important manufactures of buttons, paper, furniture, scientific and musical instruments, machinery, chocolate and sugar products, wine, tobacco, cigars, etc. The trade is extensive in the local manufactures, and in agricultural products, and the city is besides the chief export point for the various industries of the Black Forest district. It has been the seat of an archbishop since 1827. Among the attractions on the outskirts is the Schlossberg, with an ancient ruined fortress and pleasure grounds. Population, in 1890, 48,788; in 1900, 61,506, including about 17,000 Protestants and 1020 Hebrews.

The foundation of Freiburg about the year 1090 is attributed to Count Berthold III. of Zähringen. It became a free town in 1120, and attained considerable prosperity. With the death of the last member of the House of Zähringen, Freiburg passed in 1218 to the counts of Urach, whose interference with the rights of the burghers was followed by popular uprisings. The city finally bought its independence in 1368 for 20,000 silver marks and passed under the protection of the House of Hapsburg. During the Thirty Years' War it was taken repeatedly by the Swedes. In 1644 a bloody engagement took place here between the French and the German Catholics. Freiburg came into the possession of Baden in 1806. In 1848 Freiburg was the scene of a conflict between the insurgents and the troops of the German Confederation. In the following year the Revolutionary Government was expelled from the town by the Prussians, who remained there until 1851.

FREIBURG (Swiss city and canton). See **FRIBOURG**.

FREIDANK, frī'dānk (Middle High German *Vridanc*). The name assigned to the author of a German thirteenth-century didactic work, entitled *Bescheidenheit*. He was probably a native of Swabia, and accompanied the crusading army of Frederick II. to the Holy Land, where he composed a portion of his poem, about 1228-29. It

is a sort of anthology of adages and moral reflections containing much worldly wisdom, and was very popular throughout the Middle Ages and well into the sixteenth century. Many manuscripts still exist of the original, which was translated into modern German by Simrock (1867), Bacmeister (1875), and Pannier (1878).

FREIGHT (ME. *freyt*, *fraught*, Dutch *vracht*, OHG. *frēht*, from Goth. *fra*, before + *aihts*, property; probably influenced by Fr. *fret*, freight, from the same source). The hire of a ship, or part of a ship, for the transport of merchandise; also the merchandise so transported. The agreement for the service is termed a charter-party (q.v.). If a merchant freight a whole ship, but neglect to fill it, the captain is not at liberty to complete the cargo from other sources, without accounting to the merchant for any moneys received for such additional load. On the other hand, if the merchant covenant to freight a certain portion of a ship, he is bound to pay the sum agreed on for that portion, notwithstanding that his goods may fail to occupy so much space. If, in the charter-party, a day be appointed for sailing, and either the merchant fail to have his goods ready for embarkation by the time fixed, or the vessel be unprepared to start—wind and weather permitting—the agreement may be declared void by the aggrieved party, who can also recover at law for any detriment caused to his property in consequence of the delay. The use of charter-parties has been traced back as far as the reign of Henry III. This contract, which in England, and generally in the commercial language of this country, is called freight, is more commonly spoken of by the legal writers of Scotland as *affreightment* (q.v.), from the French *affrètement* (Bell, *Com.*, i., p. 414), but there is no essential difference in the laws of the two countries with regard to it. Throughout the whole commercial world, indeed, in so far as its provisions are not made the subjects of positive stipulation either by charter-party or *bill of lading* (q.v.), they will be held to be in accordance with the usage of trade, and of that particular branch of trade to which the hiring has reference. The contract for freight is generally considered to be an 'entire' contract, and not capable of part performance. It contemplates the completion of the voyage and the safe arrival of the cargo at its destination. Usually, therefore, no freight is earned in the event of a loss at sea, nor in case of a delivery at any other port than the one specified in the charter-party.

It was formerly held that the payment of the wages of the crew was contingent on the earning of freight by the ship, in accordance with the maxim of Lord Stowell, that "freight is the mother of wages." But this rule, which was already subject to many exceptions, has been abrogated in Great Britain by the Merchant Shipping Act (17 and 18 Vict., c. 104), and by statute in the United States, and wages may now be recovered either by seamen or apprentices, even though no freight has been earned by the vessel; but in cases of shipwreck the claim for wages will be barred if it be proved that the man did not exert himself to the utmost to save the ship, cargo, and stores. The provision was first introduced by 7 and 8 Vict., c. 112, sec. 17, which

enacted that, in order to enable him to recover his wages, the seaman should be bound to produce a certificate from the master or chief surviving officer of the ship, to the effect that he had so exerted himself. By sec. 183 of 17 and 18 Vict., c. 104, the onus of proof is very properly laid on those who impugn the conduct of the seaman. The old rule is still adhered to in America, but it is not applied to the master, and it does not hold with reference to seamen if the freight has been lost by the fault either of the master or owner; e.g. if the ship has been seized for debt, or for having contraband goods on board.

The word freight is a term formerly applied only to maritime business, such as the hire and use of vessels, but more recently extended to goods transported on land, as on railways where there are regular 'freight' cars. The term is used to signify also the money or consideration paid for carrying. With regard to freight by ships, the laws of the United States are practically the same as in England. See CARRIER, COMMON; and TRANSPORTATION.

FREILIGRATH, frī'lik-rät, FERDINAND (1810-76). A German poet of almost bizarre originality, an admirable translator, and a sturdy liberal agitator, born at Detmold. His father was a teacher. Though apprenticed to a grocer at fifteen, Freiligrath continued his studies, and published verses in local journals before he was twenty. The years 1831 to 1836 he spent as banker's clerk in Amsterdam. Then, after publishing translations of Hugo's *Odes*, and *Chants du crépuscule*, and launching a literary journal, *Rheinisches Odeon* (1836-38), he became a book-keeper at Barmen, but continued writing lyrics, of which a volume (1838) won immediate and wide favor. This contained the famous "Löwenritt," "Prinz Eugen," and "Der Blumen Rache," probably his masterpieces. He afterwards gave himself wholly to literature, coöperating in several now unimportant works, and gaining a pension of 300 thalers from the Prussian King. Gradually his associates drew him into political strife. In 1844 he surrendered his pension, and in his *Glaubensbekenntnis* placed his poetic gifts at the service of the democratic agitation that was to culminate in the Revolution of 1848. Such poems as "Trotz alledem" (a translation of Burns's "A man's a man for a' that"), "Die Freiheit," "Das Recht," and "Hamlet," made his absence from Germany expedient. He went to Belgium and Switzerland, published in 1846 *Englische Gedichte aus neuerer Zeit*, a volume of fine translations, and *Ca ira* a collection of political songs, and lived till 1848 in England. At the invitation of Longfellow, he meditated going to America, but on the short-lived triumph of liberalism returned to Germany as a democratic leader, was for a time imprisoned, published *Zwischen den Garben* (1849) and *Neue politische und soziale Gedichte* (1850), after which he went once more into exile in England (1851), where he remained till 1868, supporting himself by office work and admirable poetic translations, among which an anthology, the *Rose, Thistle, and Shamrock* (1854), and Longfellow's *Hiawatha* (1857), with Shakespeare's *Cymbeline* and *Winter's Tale*, are worthy of record for their felicity and faithfulness. These kept up his popularity in Germany, where in 1866 a subscription of 60,000 thalers was

raised for him, partly as a political manifesto. The general amnesty proclaimed in 1868 brought him back in time to celebrate the triumph of 1870 in the popular "Hurrah, Germania!" and "Die Trompete von Vionville." Freiligrath's works are collected in 8 vols. (Stuttgart, 1870-71), and those up to 1858 in 6 vols. (New York, 1858-59). There is a volume of select translations into English, edited by his daughter, Mrs. Kroeker (Leipzig, 1871). For his biography consult: Kippenberg (Leipzig, 1868); Schmidt-Weissenfels (Stuttgart, 1876); Buchner, *Ferdinand Freiligrath, Ein Dichterleben in Briefen* (Lahr, 1881-82); Richter, *Freiligrath als Uebersetzer* (Berlin, 1899); and Rodenberg, *Jugenderinnerungen* (Berlin, 1901).

FREIMUND RAIMAR, frî'mönt rî'mär. A pen-name of the German poet Friedrich Rückert (q.v.).

FREIND, frind, JOHN (1675-1728). An English physician. He was born at Croton in Northamptonshire, graduated at Christ Church, Oxford, in 1698, entered the medical profession, and in 1705-07 acted as physician to the English army under the Earl of Peterborough in Spain. In 1722 he was a member of Parliament, but being suspected of favoring the restoration of the Stuarts, he was incarcerated in the Tower. From 1727 until his death he was physician to Queen Caroline. He published several works on medical subjects, the most important of which is his *History of Physick from the Time of Galen to the Beginning of the Sixteenth Century, chiefly with regard to Practice* (2 vols., 1725-26). His brother, ROBERT (1667-1751), was a well-known classical scholar.

FREIRE, frâ'é-râ, RAMÓN (1787-1851). A Chilean soldier and legislator, a grandson of Freire de Andrada, born at Santiago, Chile. He served in the War for Independence from 1811 to 1820, and soon thereafter became the leader of the Liberal Party, which elected him Supreme Dictator of the Government in 1823, his reelection following in 1827. In this capacity he put an end to Spanish domination in Chile in 1826, when he forced the last Spaniards to leave the island of Chiloe. Upon the accession of the Conservative Party to power he was banished to Peru. He returned in 1842, after an absence of five years, and thereupon retired from political life.

FREIRE DE ANDRADA, dâ an-drâ'dâ, GOMES (1685-1763). A Brazilian administrator, born at Coimbra, Portugal. From 1733 until shortly before his death he was Governor and Captain-General of Rio de Janeiro, and his administration finally extended also to the other provinces of Brazil. He contributed greatly to the development of the mining interests of the country and was an active promoter of colonization. The war over the boundaries of Brazil and Paraguay was fought during his administration (1754-56). As the greatest colonial governor of Brazil, his achievements have been celebrated in the epic poem entitled *Epicos Brasileiros* (2d ed. under the title *O Uruguay*, 1811), by José Basilio da Gama.

FREISCHÜTZ, frî'shûts (Ger., free shooter). A legendary hunter who enters into compact with the devil that six balls from his gun shall follow his own will, but the seventh the devil's. The idea was general in the fourteenth and fif-

teenth centuries and especially during the Thirty Years' War. It emerged in literature in Apel's *Gespensterbuch* (1810-15), and as adapted to Weber's opera, *Der Freischütz* (1821), is universally known.

FREISING, frî'zing. A town of Upper Bavaria, situated on the Isar, about 22 miles north-east of Munich (Map: Germany, D 4). It is supposed to be of Roman origin, and has an interesting Romanesque cathedral, built at the end of the twelfth century and restored at the beginning of the eighteenth, with two towers and a curious quadruple crypt. The former episcopal palace is now occupied by a clerical seminary. The historian Otto von Freising was bishop here from 1137 to 1158. There are a theological lyceum, a gymnasium, and a number of benevolent institutions. The chief manufactures are mill and other machinery, pottery, and stained glass. The town was the capital of the Bishopric of Freising, which was founded in 724 and united in 1803 to the Bishopric of Munich. Population, in 1890, 9,485; in 1900, 10,092.

FREJES, frâ'hês, FRANCISCO (?-1845). A Mexican historian. He was born in Guadalajara, was educated for the priesthood, and became a Franciscan monk. He became widely known as a pulpit orator, but left the pulpit to pursue his historical studies. For this purpose he entered the Convent of Guadalupe, in Zacatecas, and he became its superior in 1838. His most valuable work was his *Historia breve de la conquista de los estados independientes del imperio mejicano* (new ed. 1878). He also wrote *Memoria histórica de los sucesos más notables de la conquista particular de Jalisco por los Españoles* (1842).

FRÉJUS, frâ'zhûs' (Lat. *Forum Julii*). A town in the Department of Var, France, situated 15 miles southeast of Draguignan (Map: France, N 8). It was originally settled from Marseilles, and was afterwards colonized anew by Julius Cæsar, and called Forum Julii. It has numerous important Roman remains, including walls, a pharos, a circus, and a viaduct. Augustus made the harbor, which is now silted up, the most important naval station in Gaul. Among its long list of native celebrities are Agricola the general, Roscius the actor, Cornelius Gallus the poet, the Abbé Sieyès, etc. Population, in 1901, 4,156.

FREKI. See GERI AND FREKI.

FRELINGHUYSEN, frê'ling-hî'zen, FREDERICK (1753-1804). An American lawyer and soldier. He was born in Somerset County, N. J., graduated at Princeton in 1770, studied law, and was admitted to the bar in 1774. In 1775 he was elected to the Provincial Congress of New Jersey, and at the outbreak of hostilities became a member of the Committee of Public Safety. He was elected again in the year following, and when that body resolved itself into a constitutional convention, he took an active part in drawing up the new Constitution. He was a major in the 'Minute Men' organization early in 1776, and on the dissolution of these forces recruited and became captain of one of the detachments of artillery authorized by the State Legislature, and known as the 'Eastern Artillery Company.' He participated in the battle of Trenton, and it is said to have been a shot from his pistol that mortally wounded Colonel Rahl, the Hessian commander. Early in 1777 he was made colonel of New York militia, and took part in all the military operations of

Washington's army in that year, and in the battle of Monmouth, in June, 1778. In 1778-79 and again in 1782-83, he was a member of the Continental Congress. During the next ten years he practiced his profession, attaining great eminence, and from 1793 to 1796 he was a United States Senator. In 1794, during the Whisky Insurrection, he served as a major-general of the New Jersey militia, called out by President Washington.

FRELINGHUYSEN, FREDERICK THEODORE (1817-85). An American lawyer and political leader. He was born in Millstone, N. J., graduated at Rutgers College in 1836, studied law in the office of his uncle, Theodore Frelinghuysen, at Newark, and on the acceptance by the latter of the office of chancellor of the University of the City of New York in 1839, though but twenty-two years old, succeeded to his large practice. He rose rapidly in his profession, was city attorney of Newark in 1849, and became widely known as a counsel of many important corporations, among them the Central Railroad of New Jersey and the Morris and Essex Canal Company. He was originally a Whig in politics, but was one of the founders of the Republican Party in New Jersey. In 1861 he was a delegate from New Jersey to the Peace Congress at Washington, and in the same year became Attorney-General of the State, serving until 1866. In the latter year he was appointed by Governor Ward a United States Senator, to fill the vacancy caused by the death of William Wright. In the year following his appointment was confirmed by the Legislature, and he served out the remainder of Senator Wright's term, which expired in 1869, achieving a reputation as an able debater. In 1870 he was appointed by President Grant to succeed John Lothrop Motley as Minister to Germany, but declined the appointment after he had been confirmed by the Senate. In 1871 he was elected to the United States Senate. After the disputed election of 1876 he was one of the framers of the bill creating the Electoral Commission, and after the commission was constituted, in 1877, served as one of its members. After several years spent in the active practice of his profession, he again entered political life (in December, 1881) as the successor of James G. Blaine as Secretary of State in President Arthur's Cabinet. He died in May, 1885.

FRELINGHUYSEN, THEODORE (1787-1862). An American legislator and educator, the son of Gen. Frederick Frelinghuysen (q.v.). He was born at Millstone, N. J., graduated at Princeton in 1804, was admitted to the bar in 1808, raised and commanded a company of volunteers in the War of 1812, and from 1817 to 1829 was Attorney-General of New Jersey. In 1828 he was elected to the United States Senate, where he was prominent as a debater on the Whig side, taking an especially active part in the discussions over the re-chartering of the United States Bank and the withdrawing of the Government deposits therefrom, and over the tariff; but, failing of re-election in 1835, he resumed the practice of his profession in Newark, N. J., of which city he was Mayor in 1837 and 1838. He was chancellor of the University of the City of New York from 1839 to 1850; was the Whig candidate for the Vice-Presidency on the ticket with Henry Clay in 1844; and was president of Rutgers College from 1850 until his death. Consult Chambers, *Life of Theodore Frelinghuysen* (1863).

FRELINGHUYSEN, THEODORE JACOBUS (1691-1747). An American clergyman. He was born in West Friesland, and, after holding a pastorate there, came to America and settled in New Jersey as a missionary of the Reformed Dutch Church (1720). He became widely known as an eloquent preacher and was elected a delegate to the first convention of the Reformed Dutch Church, held in New York. Several of his sermons, delivered in Dutch, were published at Utrecht, where they were most favorably received; others, translated into English by William Demarest, with a biographical sketch, were published in 1856.

FREMANTLE. The chief seaport of Western Australia, at the mouth of the Swan River, 12 miles southwest of Perth (Map: Australia, B 5). It has a fine modern town hall with a lofty clock-tower, a handsome Anglican church, hospital, insane asylum, and a literary institute with loan library. Extensive harbor works are in progress. The town is divided into three districts; population, in 1901: Fremantle, 14,623; Fremantle East, 2489; Fremantle North, 3247.

FREMANTLE, WILLIAM HENRY (1831—). An English clergyman. He was educated at Balliol College, Oxford; was fellow of All Souls from 1854 to 1864; was ordained in 1855; was selected preacher at Oxford in 1879-80, and Bampton lecturer in 1883. From 1883 to 1894 he was fellow and tutor in theology at Balliol. He was Canon of Canterbury in 1882-95, and was appointed Dean of Ripon in the latter year. His works include: *The Ecclesiastical Judgments of the Privy Council* (1865, with G. C. Brodrick); *The Gospel of the Secular Life* (1882); and *Church Reform* (1887).

FRÉMIET, frā'myā', EMMANUEL (1824—). A French sculptor, born in Paris. He was the nephew and pupil of Rude. In 1843 he exhibited his "Gazelle." This was followed by a group of animal studies, of which "The Mother Cat," "A Wounded Dog," and a "Group of Dogs," were bought by the State. In 1850 his "Wounded Bear" made a great sensation. From this time he exhibited constantly, and also contributed illustrations of birds and beasts to various magazines, and did a number of paintings in the same genre. In 1875 he succeeded Barye as professor of drawing and modeling at the Jardin des Plantes. His celebrated "Gorilla Carrying Off the Body of a Woman" was refused at the Salon of 1859, but afterwards he received the medal of honor (1877) for this powerful, if repulsive, piece. His works are very numerous. His figure pieces are often monumental and of great dignity. Many critics consider him superior to Barye in his animal studies; and his originality, his knowledge of anatomy, and the power and realism of all his work are unquestioned. Other statues and groups are the graceful, spirited "Faun," in the Luxembourg; "Jeanne d'Arc," his masterpiece, in the Place des Pyramides, Paris; "The Man of the Stone Age"; equestrian statues of Napoleon I., at Grenoble, the Duke of Orleans, the Prince of Condé; the colossal elephant of the Trocadéro Fountain, Paris; "A Mounted Torch-Bearer of the Fifteenth Century"; "Velazquez on Horseback," and the statue of Lesseps at Suez (1899). He received the decoration of the Legion of Honor in 1878.

FREMONT. A city and the county-seat of Dodge County, Neb., 37 miles northwest of

Omaha; on the Union Pacific and a branch of the Chicago and Northwestern railroads (Map: Nebraska, H 2). It has important dairying and live-stock interests, machine-shops, flouring-mills, planing-mills, and other industrial establishments; and is the seat of the Fremont Normal School. Settled in 1857, Fremont was incorporated in 1871, and is governed under a revised charter of 1901, which provides for a mayor, chosen every two years, and a city council, one-half of whose members are elected at large and the remainder by wards. The city owns and operates its water-works and electric-light plant. Population, in 1890, 6747; in 1900, 7241.

FREMONT. A city and the county-seat of Sandusky County, Ohio, 30 miles southeast of Toledo; on the Sandusky River, and on the Lake Shore and Michigan Southern, the Lake Erie and Western, and other railroads (Map: Ohio, D 3). The city is at the head of steam navigation on the river, is the centre of a fertile agricultural region and of productive oil and natural-gas fields, and has manufactures of electro-carbons, engines and boilers, agricultural implements, shears, cutlery, underwear, beet-sugar, sash, doors, and blinds, etc. There are several public parks, and the Birchard Public Library, founded and endowed in 1873, by Sardis Birchard, uncle of ex-President Hayes. Spiegel Grove, the home of ex-President Hayes, is still occupied by his heirs. Population, in 1890, 7141; in 1900, 8439. A trading post, probably temporary, was established here in 1785, and a fort, called Fort Stephenson, was erected early in 1812. A popular rendezvous of the Indian tribes, Fremont was known as Lower Sandusky until 1850, when its present name was adopted in honor of J. C. Frémont. On August 2, 1813, Major George Groghan, with 150 men, was attacked here by General Proctor at the head of 400 English and 300 Indians. The latter were repulsed with the loss of 94 killed and wounded, while of the Americans only one man was killed and seven wounded. Consult Howe, *Historical Collections of Ohio* (3 vols., Columbus, 1889-91).

FRÉMONT, JOHN CHARLES (1813-90). A distinguished American explorer and soldier, the son of a French emigrant to America. He was born in Savannah, Ga., January 21, 1813, and was educated in Charleston College, from which he received a degree in 1836. Soon afterwards he passed the necessary examination, and was appointed professor of mathematics in the United States Navy. In 1838 he was commissioned second lieutenant in the topographical engineers. In October, 1841, he married Jessie, the second daughter of Senator Thomas H. Benton (q.v.). In 1842 a geographical survey of all the territories of the United States was proposed by him, and, although his idea was not entirely carried out, he was sent at the head of a party of twenty-eight men to explore the Rocky Mountains. In his accomplishment of this task he reached the Wind River Mountains, and ascended the highest peak, later known as Frémont's Peak—13,570 feet above sea-level. His next enterprise was the exploration of the territory between the Rocky Mountains and the Pacific Coast, a region then almost unknown. Early in 1843 he started with thirty-nine men, and after a journey of 1700 miles, came to Great Salt Lake. Thence he proceeded northward to the tributaries of the Columbia River, following the valley to Fort Van-

couver. In November he started upon his return, but finding himself and party in danger of death from cold and starvation, he turned westward, and after great hardship succeeded in crossing the Sierra Nevada Mountains, and in March reached Sutter's Fort in California, not far from the place where four years later gold was discovered. He returned safely by a more southerly route, reaching Kansas in July, 1844.

In 1845 Frémont went on another exploring expedition, his last under direction of the Government, spending the summer along the continental divide, and in the winter again crossing the Sierras. He asked permission of the Mexican authorities at Monterey to continue his explorations, but they refused and ordered him to leave the country. War between Mexico and the United States was then imminent, and the authorities seemed to have been fearful of Frémont's influence upon the inhabitants of California, many of whom were Americans. Frémont, refusing to leave, fortified himself and his sixty-four men on a small mountain about thirty miles from Monterey; but when the Mexicans prepared to besiege the place, he retired and proceeded to Oregon. Near Klamath Lake he was overtaken by a courier, Lieutenant Gillespie, who had been sent by the Government with a secret message to its agent in California, and who seems to have instructed Frémont, on behalf of the Administration, to coöperate in its plan for the peaceable acquisition of California. Over the exact nature of these instructions, however, there has been much controversy. Frémont immediately returned to California; but, instead of conciliating the native Californians and encouraging them to remain neutral in case of war with Mexico, he seems to have fomented a revolt, known as the 'Bear Flag War.' Sonoma was captured and independence decided upon; but when it became known that the United States was at war with Mexico and that Commodore Sloat had seized Monterey, the American flag supplanted the Bear flag. Frémont then coöperated with Commodore Stockton in establishing the power of the United States in California, and was by him made military commandant and civil Governor. Toward the end of this year (1846), General Kearny arrived with a force of dragoons. Both he and Stockton had orders to establish a government; and friction immediately ensued.

Frémont prepared to obey Stockton, and continued as Governor in defiance of Kearny's orders. For this he was tried by court-martial at Washington, the trial lasting from November 2, 1847, to January 31, 1848, was convicted of 'mutiny,' 'disobedience of the lawful command of a superior officer,' and 'conduct to the prejudice of good order and military discipline,' and was sentenced to dismissal from the service. President Polk approved of the conviction for disobedience, but remitted the penalty, and Frémont resigned.

In October, 1848, with a party of thirty-three, Frémont started on an independent overland journey in search of a practical route to California by way of the Rio Grande. His guide lost the trail in the Rocky Mountains, and, after untold sufferings, the surviving members of the party were obliged to retreat to the Rio Grande. From there Frémont proceeded to California by the Gila route, reaching Sacramento in the spring of 1849. He then settled in California, and from September, 1850, to March, 1851, represented

the State in the United States Senate. Still faithful to the route he had attempted in 1848, in 1853 he made his fifth and last exploration, crossing the Rockies and again succeeding in reaching California. In these last two expeditions his father-in-law, Senator Benton, was interested, and the discovery of practical routes for highways or railroads was the object of the explorations.

In 1856 the Republicans nominated Frémont for the Presidency. His nomination was due to his availability, to the renown gained by his explorations, and to his known opposition to the extension of slavery. In the ensuing election he met with defeat, receiving only 114 electoral votes, while Buchanan received 174. Soon after the outbreak of the Civil War Frémont was appointed major-general, and was placed in command of the Western Department, with headquarters at Saint Louis. On August 30, 1861, he issued a proclamation confiscating the property "of all persons in the State of Missouri who shall take up arms against the United States, or who shall be directly proved to have taken an active part with their enemies in the field," and freeing all slaves of such persons. Soon afterwards he established 'a bureau of abolition' to carry out the order respecting manumission. This ill-advised action greatly embarrassed the Administration, and on September 11 President Lincoln annulled the order as unauthorized and premature. Frémont's total incapacity for the command of a department soon became evident, and, acting upon the report of Secretary of War Cameron and Adjutant-General Thomas, whom he had commissioned to make an investigation, President Lincoln removed him from command in November. A few months later, however, Frémont was placed in command of the Mountain Department of Virginia, Tennessee, and Kentucky. After the battle at Cross Keys, June 8, 1862, he declined to serve, on the ground that he outranked General Pope, who was then in command of the Army of Virginia. On May 31, 1864, he was nominated for the Presidency by a small faction of the Republican Party, constituted in great part of members of the Radical wing. Finding but a slender support, he withdrew his name in September. He subsequently became interested in the construction of railroads, and in 1873 was prosecuted by the French Government for alleged participation in the swindles connected with the proposed trans-continental railway from Norfolk to San Francisco, and was sentenced on default to fine and imprisonment. He was Governor of Arizona from 1878 to 1882, and was appointed a major-general on the retired list by act of Congress in 1890. He died July 13, 1890. Consult: Frémont, *Memoirs of My Life, Including Five Journeys of Western Exploration* (Chicago, 1887); Mrs. Frémont, *Souvenirs of My Time* (Boston, 1887); Campaign *Memoirs* by Bigelow (New York, 1856) and Upham (Boston, 1856).

FRÉMONT, frâ'môn', JULES JOSEPH TASCHEREAU (1855—). A Canadian author, born in Quebec, appointed professor of civil law in Laval University in 1893. From 1891 to 1896 he was a member of the Dominion Parliament. His publications include *Le divorce et la séparation de corps*, and a *Compendium of the Dominion Laws of Canada*.

VOL. VIII.—18.

FRÉMY, frâ'mé', EDMOND (1814-94). A French chemist, born in Versailles. He became professor of chemistry at the Polytechnic School, Paris, in 1846. In 1864 he founded, with Chevreul, a free laboratory at the Museum of Natural Sciences, of which institution he became director in 1879. His researches extended to almost every branch of chemistry. In addition to numerous treatises in the *Annales de Chimie et de Physique*, he published *Traité de chimie générale* (7 vols., 3d ed. 1862-65). The *Encyclopédie Chimique*, a work in 10 volumes, upon which he was engaged for thirteen years, was prepared by him in collaboration with several distinguished scientists, and was completed in 1894.

FRENCH, ALICE (1850—). An American novelist, better known as OCTAVE THANET. She was born at Andover, Mass., and began her literary career, about 1878, with studies of a social and economic bent, but soon turned to short stories, in which she achieved much success, especially after her removal to the West, Iowa and Arkansas, gave her opportunities for exploiting regions hitherto little attempted in fiction. Noteworthy among her stories are *The Bishop's Vagabond* (1884), *Whitsun Harp*, *The Regulator*, and *The Mortgage on Jeffy*. *Knitters in the Sun*, a collection of stories (1887), *Otto the Knight*, and other trans-Mississippi stories (1891), *A Book of True Lovers*, and *Stories of a Western Town* (1893), are volumes characteristic of her work in this field. A longer novel, *Expiation* (1890), won, and deserved, high praise for its nervous vitality, truth to life, and vivid local color. *We All* (1891) is a story for children. "Octave Thanet" has also edited *The Best Letters of Mary Wortley Montague*.

FRENCH, DANIEL CHESTER (1850—). An eminent American sculptor, born at Exeter, New Hampshire, April 20, 1850. In 1867 his father, who was a judge in the New Hampshire courts, moved with his family to Concord, Massachusetts. He studied for a year at the Massachusetts Institute of Technology, and in 1869 worked for a month in the studio of J. Q. A. Ward. In 1873 he made for the town of Concord the earliest and one of the cleverest of his more important works, the "Minute Man," and upon its completion went to Florence, where he spent a year with the American sculptor Thomas Ball. In 1876 French opened a studio in Washington; from 1878 to 1887 he made Boston and Concord his headquarters, and in the latter year settled in New York. Meanwhile, he had made frequent visits to Paris, but although he absorbed whatever appealed to him most, he does not seem to have come directly under the influence of any one French master.

French is a sculptor of great versatility, and the catalogue of his works is large. His "John Harvard" (1882) is in the severe, simple style of the "Minute Man." His busts of Emerson and Alcott are in the firm close modeling of his earlier years, and are characterized by the lofty intellectual quality which he so often shows in his portraiture. The marble statue of Lewis Cass in the Rotunda of the Capitol (1888) in Washington is more loosely handled than the two former works, but is large and strong. In the Gallaudet Monument in Washington, where the little girl is studying intently the deaf-mute

language with its inventor, Gallaudet, French first introduces the element of pathos which has become so familiar in his later works. Perhaps the most interesting is his relief, "Death and the Sculptor," for the monument of Milmore, which was exhibited at the Chicago Exposition of 1893. Of the large amount of decorative sculpture which was done by French, or under his direction, at this World's Fair, the most noteworthy were the many groups of animals. The great gilded statue of the Republic, which French placed in the Court of Honor, is perhaps the most striking colossal statue of recent times. His other work includes the monument to John Boyle O'Reilly in the Back Bay Fens of Boston (1895); the statues of Starr King in San Francisco, and of Rufus Choate in Boston; and the two fine statues, "History" and "Herodotus," for the Congressional Library in Washington. With the assistance of Potter he made an equestrian statue of General Grant, in Fairmount Park, Philadelphia (1899), and one of Washington for the United States Building in the Paris Exposition (1900). Among his most recent works are: the Hunt Memorial in Central Park, New York; the bronze doors of the Boston Public Library; and a large amount of decorative work for the Minnesota State House. His Milmore Memorial received a third-class medal at the Paris Salon of 1892, and at the Exposition of 1900 he was awarded a medal of honor. He was elected a member of the Society of American Artists; of the National Sculpture Society; and associate of the National Academy of Design.

FRENCH, JOHN DENTON PINKSTONE (1852—). A British soldier, born at Ripple Vale, Ripple, Kent. He served in the Royal Navy in 1866-67, entered the army in 1874, served with the Nineteenth Hussars in the Sudan campaign of 1884-85, and commanded that regiment in 1889-93. From 1893 to 1894 he was assistant adjutant-general of cavalry on the staff, and from 1895 to 1897 was assistant adjutant-general at army headquarters. He was promoted to the command of the Second Cavalry Brigade in 1897, and appointed major-general in command of the cavalry division in Natal in 1899. In 1900 he became lieutenant-general (local) commanding the cavalry division in South Africa. He directed the operations about Colesberg (November 10, 1899, to January 31, 1900); was in command of the cavalry in the operations terminating in the relief of Kimberley (February, 1900), and of the cavalry division of Lord Roberts's army in the operations leading to the capture of Bloemfontein and Pretoria. He also commanded Lord Roberts's left wing in the various battles east of Pretoria. For his services he was promoted to be major-general, and appointed to the command of the First Army Corps at Aldershot.

FRENCH, MANSFIELD (1810-76). An American educator. He was born at Manchester, Vt., and was educated at Burlington (Vt.) Seminary, and at the Divinity School of Kenyon College, Ohio. He was one of the founders of Marietta College, in 1835. In 1845 he joined the Methodist Episcopal Church, and from 1845 to 1848 was president of the Xenia (Ohio) Female College. He took an active part in the movement that led to the founding of Wilberforce University, the first college for negroes in America. In 1858 he became editor of *The Beauty of Holiness*, a

religious paper published in New York City. He was an ardent abolitionist, and at the outbreak of the Civil War made a study of the negro question with a view to preparing for the emancipation of the slaves. With an idea that the solution of the problem was to be found in education, he laid before President Lincoln his views. In February, 1862, he organized an immense mass meeting in Cooper Union, New York City, where his plans were explained and the organization of the National Freedmen's Relief Association followed. Of this association he became general agent, and proceeded to Port Royal, S. C., with a large corps of teachers and assistants, where, in spite of opposition from both civil and military authorities, his work among the negroes was crowned with considerable success.

FRENCH, WILLIAM HENRY (1815-81). An American soldier. He was born in Baltimore, Md., graduated at West Point in 1837, was assigned as second lieutenant to the First Artillery, served in the Florida War of 1837-38, and was engaged on frontier duty until 1847. In the Mexican War he served in the Southern campaign, for part of the time as aide-de-camp to General Pierce, and was brevetted. On September 22, 1848, he was promoted to be captain, and between this time and 1861 was stationed successively at Fort Monroe, Fort McHenry, Fort Clark (Tex.), and Fort Duncan (Tex.). In September, 1861, after the outbreak of the Civil War, he was promoted to be a brigadier-general of volunteers, and, in October, to be a major in the Second Artillery. He served throughout the Peninsular campaign, earning the brevet of lieutenant-colonel; participated in the Maryland campaign, and earned the brevet of colonel; was promoted to be major-general of volunteers in November, 1862; served in the battles of Fredericksburg and Chancellorsville; and subsequently commanded the Third Army Corps in various minor engagements. On May 6, 1864, he was mustered out of the volunteer service, and on March 13, 1865, he was brevetted major-general in the Regular Army. After the close of the war he served as a member of various boards, was several times detailed for inspection duty, was promoted to be colonel in July, 1877, was in command of the troops engaged in the suppression of the Baltimore and Ohio Railroad riots, July 18-24, 1877, and on July 1, 1880, was retired from active service.

FRENCH AND INDIAN WAR. The name usually given to the struggle in America between the French and English (1754 to 1760), roughly coincident with the 'Seven Years' War' in Europe. The French, being in possession of Canada and Louisiana, reinforced their establishments on the banks of the Saint Lawrence and near the mouth of the Mississippi, and attempted, by the occupation of various points in the interior with a line of military posts and of protected trading posts, to confine the English to a strip of territory on the Atlantic coast, while they themselves planned to occupy both the land of the Ohio basin and that surrounding the Great Lakes. The territory in dispute, and especially that watered by the Ohio, was claimed by both France and England, the French resting their claims largely upon the alleged effect on the ownership of an entire river basin of a settlement at the river's mouth, and the English insisting that

their King's grants of land 'from sea to sea' became literally effective and valid when the coast-line was permanently occupied. No permanent settlements had been made in the territory thus claimed by both, although a small settlement of Virginians was established on the Monongahela, and settlements in Ohio were in contemplation. The Governor of Virginia had organized a provincial force to protect the western frontier, and hostilities began in May, 1754, with an attack made by Washington on a French force under Jumonville. In 1755 an army of regulars, under General Braddock, acting with a detachment of Virginia troops, undertook an expedition for the capture of Fort Duquesne, which the French had built at the junction of the Monongahela and the Allegheny. This force was disastrously defeated, July 9, 1755, and the French retained full control of the frontier. Being enabled to operate on an 'inner line' of communication, while the English were obliged to conduct a series of isolated and unrelated campaigns, the French maintained their advantage until the summer of 1758, when they inflicted a great defeat upon the British in the battle of Ticonderoga, July 8th, their last important success. The fortune of war now turned. Largely as a result of a more energetic policy introduced by the Pitt Administration, the English campaigns were prosecuted more vigorously, and resulted in the capture of Louisburg (July, 1758), of Fort Frontenac, on Lake Ontario (August, 1758), and of Fort Duquesne (November, 1758). The French line of defense and of communication was thus broken; and this success was made secure in the following summer by the capture of Ticonderoga, Crown Point, and Fort Niagara. Finally, on September 13, 1759, the forces of General Wolfe defeated the army of Montcalm which was defending Quebec, whose surrender followed, and in September, 1760, control was gained of Montreal and the rest of Canada. Peace was not made until the Seven Years' War (q.v.) on the Continent was concluded; and in the Treaty of Paris, of 1763, France ceded Canada to England, and England received from Spain the Floridas, which she retained until 1783, while Spain received Louisiana from France. Thus France lost her possessions on the American continent. Consult: Winsor, *The Mississippi Basin* (Boston, 1895); Parkman, *Montcalm and Wolfe* (Boston, 1884); Sargent, *History of an Expedition Against Fort Duquesne, 1775*, edited from original manuscripts (Philadelphia, 1856); Casgrain, *Montcalm et Lévis* (Tours, 1898); Doughty and Parmlee, *The Siege of Quebec and the Battle of the Plains of Abraham* (6 vols., Quebec, 1901); and Bradley, *Fight with France for North America* (New York, 1902).

FRENCH BROAD. A river rising in the Blue Ridge Mountains, in western North Carolina (Map: North Carolina, B 4). It flows northwest and then west, and joining the Holston River 3 miles above Knoxville, Tenn., forms the Tennessee River (q.v.). It is over 200 miles long, and flows through a country famed for its scenery. The chief town in its course is Asheville, N. C.

FRENCH CHALK. See CRAYON.

FRENCH CON'GO. A possession of France in Western Equatorial Africa, bounded on the

north by Wadai, on the east and south by Egyptian Sudan, the Congo Free State, and Angola, and on the west by the Atlantic Ocean, the Spanish colony Rio Muni, Kamerun, and Nigeria (Map: Congo, B 2). It reaches Lake Chad and the Bahr-el-Ghazal in the north. The Congo and Ubangi rivers border it on the southeast. The area is about 450,000 square miles. The coast is diversified by several bays and many lagoons. The interior is but partly explored. It is mountainous in the south, with elevations reaching 3600 feet; the river valleys are numerous, extensive, and very fertile. The Gabun, Ogouai, Sanga, Lalli, and Licona are among the important rivers, some of which may be classed as navigable streams. The fauna includes the buffalo, leopard, rhinoceros, and crocodile; and the home of the chimpanzee and gorilla is found here. The French Congo is one of the most promising of African colonies, although the climate is unhealthful for Europeans. The forests are valuable, and rubber is a prominent product. There are mineral resources of gold and iron; also some copper. Manioc is raised by the natives, and coffee, vanilla, etc., are grown by Europeans. The exports are chiefly rubber, ivory, and costly woods. Some of the other exports are coffee, cocoa, palm oil, and piassava. In 1900 the exports amounted to \$1,457,000. The imports for 1900 were \$2,050,000. Almost 40 per cent. of the total commerce is with France and French colonies. Ninety-nine vessels, of 137,698 tons, entered the ports in 1900, mostly at Loango, which has the only good harbor.

The country is administered by a Commissioner-General and an Administrative Council. The upper regions along the Congo and Ubangi rivers are, however, under military control, and are known as the Military Territory of the Countries and Protectorate of the Shari. The local budget of 1900 balanced at about \$740,000. A loan of nearly \$400,000 was authorized for the construction of roads, telegraphs, and other public improvements. In the French budget of 1902 the Congo called for \$100,000. The transportation and communication facilities are very meagre. A telegraph line connects Brazzaville, Loango, and the English Atlantic cable. The population is estimated at from 8,000,000 to 15,000,000, including the Fan, Bakalai, Mpongwe, and several other important and interesting races or tribes. The capital is Libreville, with about 3000 inhabitants. Loango, Franceville, and Brazzaville are also noteworthy towns. There are 56 schools for boys and girls, and over 2500 scholars.

The coast of French Congo was discovered by the Portuguese in 1470. In 1841 the French established a footing on the Gabun River, and actively began operations. Libreville was founded in 1840. In 1862 Cape Lopez was acquired, and the French were then in possession of the coast for 200 miles. Explorations and military expeditions extended the French rule northeast until, by a series of conventions beginning in 1885 with European powers, the present limits of the French Congo were fixed. Consult: Dutreuil de Rhins, *Le Congo français* (Paris, 1885); Payeur-Didelot, *Trente mois au continent mystérieux. Gabon-Congo, etc.* (ib., 1900); Guillemot, *Notice sur le Congo français* (ib., 1900).

FRENCH CREEK. A stream in Jefferson County, N. Y., emptying into the Saint Law-

rence. On November 1 and 2, 1813, a small American force, under General Brown, intrenched on its banks near the site of the present Clayton, N. Y., repelled, with the loss of only two men killed and four wounded, an attack of twelve British vessels, which suffered severely in the engagement.

FRENCH FURY, THE. A name given to the attack made by the Duke of Anjou on Antwerp on January 17, 1583. The attempt was repelled, and all of the assaulting force were killed or captured.

FRENCH GUIANA. See GUIANA.

FRENCH GUINEA, gin'è. A French possession in West Africa, bordered by Portuguese Guinea and by Senegal on the north, the Military Territories of French Sudan on the east, Sierra Leone, Liberia, and the Ivory Coast on the south, and the Atlantic Ocean on the west (Map: Africa, C 3). French Guinea extends on the north to the towns of Kedugu and Birgo, and includes in the east the territories of Dinguiray, Sigui, Kurrussa, Kantan, Kissidugu, and Beyla, the river Sankarani forming the eastern border. The area is about 95,000 square miles, embracing Futa-Jallon (q.v.). The coast region was known as Rivières du Sud before 1893. French Guinea is largely a mountainous country, with a rather favorable climate, and some fine forests. The coast streams are numerous. The Manea and Dubreka rivers empty into the ocean near Konakry. The country produces millet, rice, rubber, gum, and palm-kernels. In Futa-Jallon, coffee, rice, cotton, etc., are raised, and there are minerals and large herds of cattle. Several manufacturing establishments, mainly French, are situated in Konakry. In 1900 the imports of French Guinea were \$2,755,200, about one-tenth being from France; the exports were \$1,887,500, of which about one-fourth went to France. Cotton goods were the main import (nearly one-third); and by far the leading export was rubber, with cattle and palm-kernels ranking second and third, respectively, on the list. The commerce of the country is rapidly increasing. In 1899, 5002 vessels of 308,523 tons cleared the ports. French, English, and German steamers regularly visit Konakry, from which port a railway is building to the Niger to attract trade from Timbuktu. Sigu Sikora, and other interior points. There is a telegraph line from Konakry to Boké and thence to Kankilifa.

French Guinea is divided into administrative circles, and is administered by a Governor (who is under the Governor-General of French West Africa, q.v.), and by a local council of six members, three chosen from the Government officials, and three from the leading citizens. Futa-Jallon has, to some extent, a separate administration. The local budget of French Guinea balanced at \$1,330,800 in 1901. The financial condition of the colony is good. In all the foregoing statistics Futa-Jallon is included, as well as in the population of the country, which is given at 2,200,000. The capital, Konakry, on the island of Tombo, is the chief city, and is newly built. It is connected with the mainland by a bridge. Other noteworthy towns are Boké, Ubréka, and Timbo. There were seven schools in the country in 1897.

The coast of French Guinea was known to

Portuguese explorers at an early date. In the first part of the seventeenth century French merchants began trading in parts of the country, and in 1685 the Compagnie de Guinée obtained from Louis XIV. exclusive commercial privileges for a large part of the West African coast, and the region was embraced in a general way in the French 'pacte colonial.' The littoral portion, called Rivières du Sud, was taken possession of outright by France during the period from 1854 to 1869. The French, in 1884-85, obtained a footing in Bure, and forced the Almani rulers of Futa-Jallon and neighboring districts on the east to a treaty of peace in 1887. A stubborn contest was next undertaken with Samori and his newly founded kingdom of Wassulu, on the southern headstreams of the Niger, northeast of Liberia. In February, 1891, at Kantan, on the Milo, he was defeated and driven out of Bissandugu, Sanakoro, and Keruane, and his followers, the Sofa, were scattered. Consult Aspe-Fleurimont, *La Guinée française* (Paris, 1900).

FRENCH HORN. A name assigned to the horn formerly much used in the full orchestra. It has a range from B₂ to f², but the four tones at either extreme are difficult and seldom used. See HORN.

FRENCH INDO-CHINA. The general name for the French possessions in Southeast Asia, to wit, the colony of Cochin-China, and the protectorates of Tongking, Laos, Annam, and Cambodia. (For more particular information, see these different headings.) French Indo-China is bounded by China on the north; the China Sea on the east and south; the Gulf of Siam on the southwest; and the Mekong River on the west, beyond which lies Siam. The estimated area and population of French Indo-China in 1900 are given as follows:

	Area in sq. miles	Population
Tongking.....	46,000	7,000,000
Annam.....	50,000	5,000,000
Laos.....	98,400	605,000
Cambodia.....	38,600	1,500,000
Cochin-China.....	22,000	2,270,000
	255,000	16,375,000

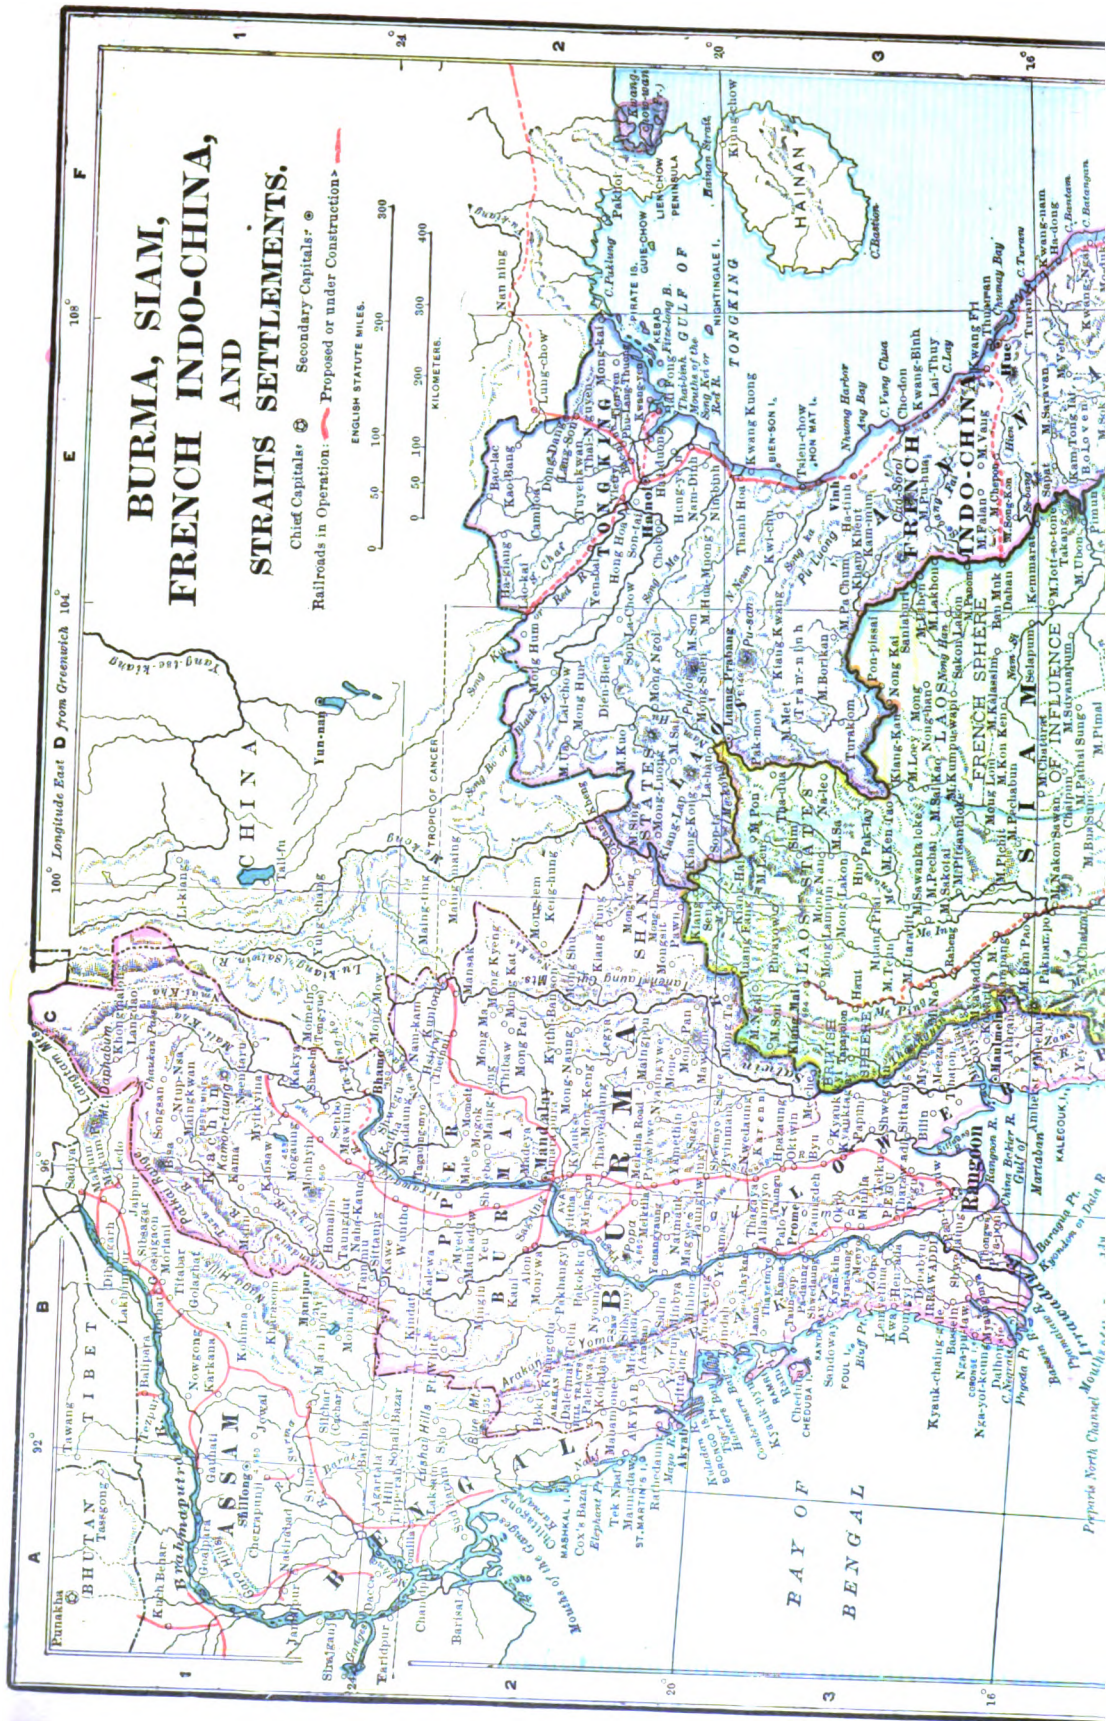

The French emigration to Indo-China is very small, but the Republic is actively engaged in organizing the affairs and improving the commercial and industrial conditions of the country. At the head of the French administration is the Governor-General, with his seat in Saigon, under whom are the Governor of Cochin-China and the Resident Superiors of the four protectorates. Kwang-Chi-Wan, on the China coast, is also since 1900 a political part of Indo-China, having been leased from China. Since 1887 a customs union has united these various possessions. In 1900 the imports were valued at \$37,200,000, the exports at \$31,200,000. The local revenues for Indo-China for 1902 were estimated, in piastres, at 27,142,000, and the expenditures at 27,128,000. The budget is maintained chiefly by receipts from Government monopolies, customs, railways, telegraphs, and posts, and provides for the military and judiciary systems, the public works, etc., of the whole country. The expenditures of the Republic (budget of 1902)

for Indo-China were, approximately, \$6,800,000. The Indo-China Bank is a large institution, especially engaged in furthering local enterprises. Many lines of railway are in process of construction. The army consists of 8860 French and 14,935 native troops, all under French officers.

The beginning of French influence in South-eastern Asia may be traced to missionary efforts. These were begun in the seventeenth century in Siam, whence they spread to Tongking and Annam. A Siamese embassy appeared at the Court of Louis XIV. in 1685. In 1774 local troubles broke out in Annam, and King Gya-Long was forced to seek shelter with the French bishop in the Province of Saigon. Military aid on a large scale was promised, but the troubles in France delayed operations until 1802, when, with the assistance of the French, King Gya-Long regained his throne. His dominion extended over what is now French Indo-China. Several French officers remained in his service, and French engineers fortified the chief cities. King Gya-Long gave certain privileges to French and Spanish missionaries, but his successors were less friendly. The advisers of King Minh-man, about 1820, urged him to a policy of repression which turned into persecution. A French expedition set out against China in 1857, and the gradual conquest of the whole country began. In 1861-62 the French became masters of the principal part of Cochin-China, and about the same time they established a protectorate in Cambodia. In 1882 the Third Republic resolved upon a highly aggressive policy, and after that year, and especially after the war between Japan and China had left China in a helpless condition, the French steadily pressed their conquests until they possessed all the country east of the Mekong.

FRENCH LANGUAGE. HISTORY. The ancient inhabitants of the country now called France were the Gauls or Celts. They spoke the Celtic language, which is related to the dialect of modern lower Brittany and to the Welsh of Wales. In the first century B.C. the Romans, under the leadership of Julius Cæsar, conquered Gaul and imposed the Latin language upon its inhabitants. There were, however, two Latin languages, that of the writers and orators (*sermo urbanus*) and that of the lower classes of the people (*lingua Romana rustica*). It was the latter that was brought to Gaul by the soldiers, merchants, and colonizers. Four centuries later Latin was spoken almost everywhere in that country. Every now and then a scholar, impelled by patriotic motives, endeavors to prove that the Gauls did not give up the tongue of their ancestors, but that Latin and Celtic possess in common a number of roots, and that French can therefore just as well be traced back to Celtic. The chief difficulty in this theory is that, as we know so very little of the Celtic tongue, its characteristic features can be only vaguely conjectured; thus a direct proof of the thesis is *a priori* impossible. Moreover, Italian, Spanish, and the other Romanic languages offer such convincing examples of an evolution similar to that of Latin into French that the question may safely be considered as settled. To gain an idea of the weakness of the position of the Celtic School one need only read Marcillac, *Les vraies origines de la langue française* (Paris, 1901). On the other hand, nobody ever tried to contest the fact that the Gauls be-

queathed a certain number of words (exactly how many it is difficult to say) to the *lingua Romana rustica*, and through this medium to French. Here are a few examples:

LATIN	FRENCH	CELTIC
alauda, beccus,	alouette, bec,	? becco, whence also becquée, becqueter, bécassee, béquille.
carrus, brugaria, leuca,	char, bruyère, lleue,	cart. brug. leuga.

In the fifth century Gaul was conquered a second time by the Visigoths, Burgundians, and Franks; the last of whom, the most powerful of the Germanic nations, soon became masters of the whole country. But this time the conquerors adopted the language of the conquered, introducing into it only about four hundred Germanic words, mostly terms of war, among which may be mentioned:

LATIN	FRENCH	GERMANIC
berfredus, crapaldus, faldistollum, filtrum, mariscalus, werra,	berfroil, crapaud, fauteuil, feutre, maréchal, guerre.	berfrit. craup. falistuol. filz. marahscale. werra.

A few Greek words came into France in the sixth century through Greek colonies on the Mediterranean, especially Marseilles, Nice, and Monaco; as for instance:

LATIN	FRENCH	GREEK
bastum, byrra, colla, hemisrania,	bat, bourse, colle, migraine,	root of βαστάζειν. βύρρα. κόλλα. ἡμικρανία.

A number of other Greek vocables were introduced in subsequent periods either by the Church (*évêque, prêtre, hérétique, moine, basilique*), or by scholars for a definite scientific purpose.

Toward the beginning of the seventh century the idiom spoken in France differed enough from the lower Latin to be called a new language, the *Romanic*. The main transformations undergone by Latin were the disappearance or obscuration of the non-accented syllables in words (*hospitale* becomes *hôtel*; *rigidum, roide*; *liberare, livrer*, etc.); and the prevalence of analysis over synthesis in syntax (*Petri* becomes *de Petro*; *amavi* = *amatum habeo, habet* = *ille habet*). As early as the sixth century the historian Gregory of Tours remarks that "the scholarly language [Latin] is no longer understood except by a few people, while the rustic [Romanic] is understood by everybody." From that same time the homilies of the Church councils begin to be translated into the popular idiom. The famous 'Capitulaires' (royal edicts) of Charlemagne, in the eighth century, require the bishops to use Romanic in their sermons.

Quite early a marked difference was noticeable between the spoken languages of the northern part of France and that of the south, the dividing line extending from La Rochelle, at the mouth of the Charente, through Limoges and Clermont-Ferrand, to Grenoble. The first, which was the more important of the two, and was to become the French of to-day, was the *langue d'oïl*, while the second, which became the modern Provençal, was the *langue d'oc*. *Oïl* and *oc* were the words meaning 'yes' in the two respective

idioms. The two idioms again branched into several dialects or patois. Of those of the *langue d'oïl*, four were especially important: those of Ile de France, Normandy, Picardy, and Burgundy. The dialect of Ile de France began to prevail over the others in the twelfth century, thanks especially to the political predominance of the kings residing in Paris, who gradually succeeded in compelling allegiance on the part of the barons of the provinces. The ascendancy was complete at the end of the fourteenth century.

The *langue d'oc* also split into different dialects (Gascon, Languedocien, Auvergnat, Provençal, Savoyard, etc.). An era of brilliant literary production seemed for a moment to assure its supremacy in the future over the *langue d'oïl*. After the twelfth century, however, it declined rapidly; but it did not fall back into the condition of a 'patois' (the name given in French to languages merely spoken, not written), without contributing a certain number of terms to the *langue d'oïl*: *carguer*, *cap*, *mistral*, *corsaire*, *vergue*, *carnassier*, *jaser*, *ruser*, *fâcher*, *roder*, *malotru*, *badaud*, *forçat*, *ménestrel*, *ballade*, *pelouse*, *caisse*, etc.

During the twelfth and thirteenth centuries the French language had a great popularity in Europe, if we may trust two Italian writers of the time—Martino di Cassale and Brunetto Latini. We are even told by others that rich barons engaged the services of French-born tutors for their children. No new contribution to the vocabulary is to be mentioned at this period, except a few Arabic terms (about fifteen) brought to France by the knights who returned from the Crusades (*bazar*, *haras*, *avoine*, etc.). The fourteenth and fifteenth centuries, the epoch of the disastrous Hundred Years' War, were less brilliant. After the tenth century, when the classical Latin had fallen already into complete disuse, a tendency prevailed among more or less happily inspired scholars to introduce into the current language words taken bodily from Latin, and therefore unmodified by the natural process of transformation through the medium of lower Latin and Romanic. It happened therefore that a considerable number of Latin terms gave two French words, one of popular, the other of scholarly origin:

hospitalem,	hôtel, hôpital.
rigidum,	roide, rigide.
fragilem,	frêle, fragile.
liberare,	livrer, libérer.

These words are called *doublés*. This method of enriching the dictionary became common in the fourteenth century, and lasted through the fifteenth and the sixteenth. The Renaissance only encouraged this tendency. In the seventeenth century, however, a reaction set in, and Molière may be said to have contributed much toward putting an end to the false erudition of his contemporaries by his pitiless attacks, particularly in the amusing third 'Intermède' to the *Malade imaginaire*.

We have to record in the sixteenth century the first serious attempt to regulate the French language, to adopt grammatical rules, and to fix the vocabulary. While this was certainly a good work, one cannot but regret the loss of a great many picturesque and excellent words sacrificed to a need of order and to the fear of impropriety. Here are a few of the excluded terms:

ardoir (*brûler*), *cuidier* (*croire*), *desduit* (*plaisir*), *emmy* (*au milieu de*), *ire* (*colère*), *orée* (*bord*), *ost* (*armée*), *prou* (*beaucoup*). Some, like *dévaler* (*descendre*), *fétard* (*paresseux*), and others have remained in the colloquial vocabulary.

A formidable invasion of about five hundred Italian words during the sixteenth century was also detrimental to the language. It was due to the predominance of Italian customs at the Court as a result of the presence of Catharine de' Medici, and also to the wars in Italy. These two distinct influences brought in two distinct classes of words; the one consists of expressions borrowed from the sphere of art: *ariette*, *aquarelle*, *arcade*, *arlequin*, *artisan*, *baladin*, *balcon*, *barcarolle*, *bouffon*, *burlesque*, *buste*, *campanile*, *carnaval*, *charlatan*, *concert*, *esquisse*, *façade*, *feston*, *fugue*, *girandole*, *gouache*, *mandoline*, *opéra*, etc. The other is composed of military terms: *alarme*, *ulerte*, *arsenal*, *bastion*, *bombe*, *canon*, *caracolier*, *carrousel*, *colonel*, *cocarde*, *escalade*, *escrine*, *embuscade*, *estafette*, *estafilade*, *fantassin*, *sentinelle*, *soldat*, *timbale*, *vedette*, etc.

In the early part of the seventeenth century there was a similar Spanish invasion, and French was enriched by about one hundred words: such as *abricot*, *alcôve*, *bizarre*, *corridor*, *duègne*, *mantille*, *sieste*, etc. At the same epoch a few words came from Germany, several wars having more than once brought its inhabitants into contact with the soldiers of France: *bivouac*, *blocus*, *fifre*, *havresac*, *loustic*, *lansquenet*, *obus*, *rosse*, *tringuer*, *choucroute*, *kirsch*, *nouille*, *graver*, *valser*. The influence of the *Précieuses* (see FRENCH LITERATURE) ought not to be ignored. A few illustrations of expressions coined by them and subsequently taken up in the current language may be of interest here: *être de qualité*, *un procédé tout à fait irrégulier*, *une chose du dernier bourgeois*, *donner dans le vrai*, *avoir des lumières sur un sujet*, *avoir l'intelligence épaisse*, etc. The Académie Française, founded 1635 (see ACADEMY), has always taken a rather conservative attitude. The policy of its members has been from the beginning to record (*constater*), not to innovate. The eighteenth century is the period in which France has exerted the most remarkable influence over European civilization. The glorious reign of Louis XIV. had indirectly contributed to make French an international language. It was recognized as such not only by politicians and by the higher society in every country, but even by the scholars who used it in their books to increase the number of their readers. It was a few years after the death of Voltaire and Rousseau that the Academy of Berlin established a prize contest on the three following questions: "Qu'est-ce qui a rendu la langue française universelle? Pourquoi mérite-elle cette prérogative? Est-il à présumer qu'elle la conserve?" The enthusiastic answer of Rivarol, known as the "Discours sur l'universalité de la langue française," was crowned. The language may have increased in accuracy, clearness, and elegance during the eighteenth century, but it acquired no new qualities. It may be said that by rendering it too perfect, Voltaire robbed French of a part of its strength, of its wealth, and of its originality.

The Revolution gave birth to a number of new expressions. The Académie had been suppressed

by a decree of August 8, 1793; the 'Sections de Grammaire et de Poésie' of the Institut (founded in 1795) took provisionally its place. An edition of the *Dictionnaire* was, nevertheless, published in 1798 by the new men, and as they did not dare to introduce into it the words that had been recently coined, they put them in an appendix. Some of them have disappeared, some have remained. Among the latter are: *administratif*, *aéronaute*, *assignat*, *bureaucrate*, *carmagnole*, *centralisation*, *club* (pronounced clob), *décade*, *démoraliser*, *divorcer*, *fédéraliser*, *guillotine*, *guillotiner*, *monarchiste*, *polytechnique*, *révolutionner*, *septembriser*, *terrorisme*, etc. Most of them, as may be seen, are clumsily constructed. In the early part of the nineteenth century the Romanticists tried to bring new life into the language by adopting French words which had been given up in the course of previous periods. Victor Hugo says of himself, that he has

"tiré de l'enter
Tous les vieux mots damnés, légion sépulcrale."

This, however, was imitation of life, not life itself, and the movement soon died out, until a new and still less successful effort in the same direction was made by the poets of the Symbolist School (especially by the group of the Romanistes) in 1896. (See the *Glossaire* by Plowert—pseudonym for Paul Adam.) Two events of great importance took place in the second half of the nineteenth century. First, the cosmopolitan tendency common at this epoch to all European languages made itself felt in French. Its most noticeable result is the influx of English words: the more one advances, the more Anglo-mania seems to gain ground. All attempts to check the movement have proved vain. Endless lists of these borrowed terms have been made by scholars: *bol*, *boze*, *bouledogue*, *châle*, *chèque*, *clown*, *cabbage*, *dandy*, *drainer*, *fashionable*, *groom*, *hall*, *humour*, *lunch*, *meeting*, *plaid*, *speech*, *sport*, *square*, *tender*, *ticket*, *toast*, *touriste*, *tunnel*, *verdict*, *wagon*, *whist*, etc. The second event is the still greater invasion of scientific terms which are common to all countries: *photographie*, *télégraphe*, *téléphone*, *anémométrie*, *antalgique*, etc. This double current results naturally in a continual proportional decrease of the stock of genuine French words. The purity and the beauty of the language do not gain by it either, and Petit de Julleville's statement seems to be correct—namely, that the new terms have "déméurement grossi plutôt qu'enrichi le vocabulaire." Littré, Nodier, Jullien, Egger, Darmesteter. Brunot have raised their voices in vain in the sense of Petit de Julleville. The Académie itself can no longer resist; no less than 2200 neologisms were inserted in the seventh edition of the *Dictionnaire* in 1878.

The present state of the French language may be tabulated roughly as follows, taking as our basis the 32,000 words of the last edition of the *Dictionnaire de l'Académie*:

Of Latin stock.....	3,800
Of early Germanic origin.....	400
By derivation from primitive words (such as <i>Richard</i> , <i>erickbir</i> , from <i>riche</i> ; <i>pauvette</i> , from <i>pauvre</i>).....	7,800
Of foreign and scholarly origin.....	20,000
	32,000

Moreover, the style cannot be said to have improved. The simultaneous influences of science

and realism have dried it up, and that of the newspapers, which grows daily, is a constant source of corruption. However, a few individual writers, like Renan and Anatole France, Remy de Gourmont and Mirabeau, in the second half of the nineteenth century, as Châteaubriand at its opening, have gloriously upheld the traditions of pure and elegant French.

French is used by about forty million people. It is the language of the greatest part of France (Brittany and a few southern districts only being excepted), of part of Belgium and Switzerland, and part of Canada. In Louisiana it is fast disappearing. If, owing to the growing importance of economic interests in the world, English has become the predominant language in civilized countries, French has, nevertheless, retained a part of its prestige and is still considered the most refined among the leading idioms of the earth.

GRAMMAR AND SYNTAX. For the early period, see **ROMANCE LANGUAGES**. For a long time no uniform system of orthography existed. If one reads, for instance, the fable of "The Wolf and the Lamb," by Marie de France (thirteenth century), it will be found that within thirty-eight lines the word for lamb is spelled in six different ways, and that for wolf in four. The example of Rabelais is often quoted, who wrote the word for oil in three different ways within the space of six lines. We have seen that the regulation of the language began in the sixteenth century. At once two schools were formed disputing over the best method of spelling; one of these demanded etymological, the other phonetic orthography. As erudition was much in favor at the time, the phonetic system had to yield, and furthermore a number of useless letters were wrongly introduced under the pretext of etymology: *d* in *poids*, *b* in *devoir*, *l* in *cheval*, *veult*, and even *peult*; *diner*, which is really a contraction of *déjeuner*, was written *dipner*, as if from the Greek *δινειν*.

In the seventeenth century a number of these letters were dropped, but new attempts at phonetic spelling failed once more. Grammar and syntax at this period are still in a state of disorder. The greatest writers are at variance as to the gender of certain words; the existence of rules for the use of the partitive article and of the personal pronouns is only vaguely suspected; the comparative is occasionally used for the superlative; the participles, present and past, agree or do not agree at the will of the writer. It was, however, at that epoch that the present rules of the agreement of participles was formulated by Vaugelas, in his *Remarques sur la langue française*. Briefly, it may be said that the seventeenth century observed the logical rather than the grammatical connection of words.

In the eighteenth century the rules established during the previous period were gradually carried out, and the liberties of syntax and orthography were dropped one by one. Owing to the influence of the experimental philosophy, requiring precision of style, the sentences became gradually shorter, while the long harmonious period of the classical age fast disappeared. Already at the close of the seventeenth century, Bayle protests against this simplification of style, which he considers a degeneration. "Ils recommencent une période à chaque ligne; c'est prendre le parti le

plus facile; un paresseux s'accommode fort de cela." The Académie, in the 1742 edition of its Dictionnaire, drops a number of double letters, replaces the *s* by a circumflex before a consonant (*blâme* for *blame*), and in a few cases substitutes an *i* for the *y*. In the edition of 1762 other innovations have to be recorded—namely, the distinction of *i* and *j* and of *u* and *v*.

Voltaire had tried in vain to bring about the use of *ai* instead of *oi* in the endings of verbs, according to pronunciation, but this reform was not adopted by the Académie till the edition of 1835. Except for this change, the language of the nineteenth century has remained on the whole stationary. The last decade, however, has been an era of orthographic reforms. For a long time individual efforts in that direction, made by prominent men (Didot, Littre, and others), had remained without effect. But since 1890 societies have been organized in France, Belgium, and Switzerland in order to bring about the desired improvements. They have a special organ, *Le Réformiste*, edited by Jean Barès, who made his fortune in South America and devoted considerable sums of money to the cause. A first set of reforms has been officially introduced by the French Minister of Public Instruction in an edict of February 26, 1901. Other changes are contemplated.

PHONETICS. For early period, see ROMANCE LANGUAGES. In the sixteenth century the pronunciation of the letters was as variable as orthography. *A* and *e* were interchangeable; the same is true of *ou* and *u*, *ou* and *eu*, *oi* and *ai*. The *e*, rarely accentuated, assumes different sounds. The consonants *s* and *z*, *s* and *r*, are used freely, the one for the other, *oiseau* and *oizau*; and while in most cases one of the two forms has disappeared, both *chaise* and *chaire* have continued to be used simultaneously, though with different meanings. Phonetics are in close connection with orthography, and they have been studied with great care since the middle of the nineteenth century, especially with a practical object in view. Lesaint, Vogel, and, above all, since 1887, Paul Passy should here be mentioned. Passy's little treatise, *Les sons du français*, is widely known. Ch. Nyrop, a Dane, has also made for himself a reputation in this domain. His *Manuel phonétique du français parlé* (1902) is a model of patient, accurate, and impartial labor. In America, Professor Grandgent, of Harvard University, has employed the phonetic method with success in his widely used school books.

VERSIFICATION. The chief element of Latin poetry was the quantity of the syllables. This has been altogether given up in French versification. A few poets, especially in the sixteenth century, Balf and Jodelle, for instance (see FRENCH LITERATURE), under the influence of the Renaissance, tried to write French poetry according to the Latin system. They never succeeded in producing anything satisfactory.

The elements of French versification are three: (1) The number of syllables, from twelve down. The mute syllables at the end of a verse never count; in the middle of the verse they sometimes count, sometimes not; the number changes more or less according to the epoch. In the Middle Ages the poet was very free; in the classical period he was less so. The Symbolists of the

end of the nineteenth century have frequently allowed themselves as great a liberty as the poets of the twelfth and thirteenth centuries. (2) The accentuation. The verse must always end on an accented syllable, and if the verse is divided into smaller parts (e.g. 6 + 6, 4 + 4 + 4, 6 + 4, 4 + 4, etc.), each part in its turn must end on an accented syllable. By accented, one must understand the last syllable of a word of importance for the meaning conveyed, or an important monosyllable, such as a noun or a verb. Articles, conjunctions, and prepositions are rarely in place as accented syllables. (3) The rhyme. The original form is the assonance, i.e. the repetition at the end of a verse of a vowel sound. We find, for instance, the following assonances in a stanza of the *Chanson de Roland*: *abe, able, abre, ace, aile, etc.*, or *i, id, ilz, vi, etc.* Rhyme is only a more perfect assonance, the letters following the vowel being also made to agree, thus *courage, village*. Still later the consonant preceding the vowel of the rhyme was required to be the same in both words (*consonne d'appui*); thus, *orage, courage*. The latter is called 'rime riche' or 'pleine,' while the other one is only 'suffisante.'

Different rules concerning the rhyme were added in the course of time: The rhyme was to connect verses two by two; in the sixteenth century it was decreed that two masculine rhymes (i.e. ending on a sounded syllable, like *amour, départ*) must alternate with two feminine rhymes (i.e. ending on a silent *e*, like *table, fille*). The result of these and other rules contributed to make French poetry more regular, but also more monotonous. The yoke of the narrow code of versification established by Malherbe and Boileau in the seventeenth century was not shaken off until the time of Victor Hugo and Romanticism. Even their attempts to gain more liberty were temporarily crushed by the poets of the Parnassian School from 1866 onward. The fight was, however, taken up again and victoriously carried out by the Symbolists: the *vers libre* was the outcome of their sweeping reform. According to them everything, the number of syllables, accentuation, rhyme, depends altogether upon the subjective criterion of each writer; there are as many forms of versification as there are individual poetic feelings. Few of the Symbolists made much use of the freedom thus regained, and a state of equilibrium has slowly come about since the excitement of the contest has passed away. Symbolists have become more inclined to recognize traditional principles, while their opponents have agreed to allow considerably more freedom to the individual tastes of the artist than was formerly the case.

BIBLIOGRAPHY. A clear, concise history of the French language was published for the first time in 1901, Brunot, *Histoire de la langue française*. Consult also Petit de Julleville, *Notions générales sur les origines et sur l'histoire de la langue française* (4th ed., Paris, 1897); the prefaces to the different editions of the *Dictionnaire de l'Académie*, 1694, 1718, 1740, 1762, 1798, 1835, and 1878; Bréal, *Essai de sémantique* (Paris, 1897, Eng. trans. 1899); Darmesteter, *De la création actuelle des mots nouveaux dans la langue française* (ib., 1877); id., *La vie des mots étudiée dans leurs significations* (4th ed., ib., 1893); Deschanel, *Les déformations de la langue française* (ib., 1898); Remy de Gourmont, *L'esthé-*

tique de la langue française (ib., 1899); id., *Les funérailles du style* (ib., 1902).

Dictionaries: *Dictionnaire de l'Académie* (7th ed., Paris, 1878); Littré, *Dictionnaire de la langue française* (ib., 1874-84); Hatzfeld, Darmesteter, Thomas, *Dictionnaire général de la langue française* (ib., 1890-1901); for ordinary use, Pierre Larousse, *Dictionnaire complet illustré* (revised every year). Consult also: Brachet, *Dictionnaire des doublets* (Paris, 1883); Scheler, *Dictionnaire de l'étymologie française* (3d ed., Brussels, 1888).

Grammars: For Old French, consult the authorities referred to under ROMANCE LANGUAGES. Here may be noted Clédat, *Grammaire historique du français* (Paris, 1889); Brunot, *Grammaire historique de la langue française* (ib., 1887). Of special value for the later French are the grammars of Clédat, *Grammaire raisonnée de la langue française* (Paris, 1894); of Mätzner, *Syntax der neufranzösischen Sprache* (Berlin, 1843-45), of which there is a reworking in English, Harrison, *French Syntax* (Boston, 1885), Ploetz, and Whitney. Of more pedagogical value are those of Edgren, Grandgent, Fraser, and Squair. Consult also Darmesteter, *Traité de la formation des mots composés dans la langue* (2d ed., Paris, 1894). With special reference to orthography, A. Firmin Didot, *Observations sur l'orthographe* (Paris, 1868); Renard, *La nouvelle orthographe* (ib., 1894); Barès, *L'orthographe simplifiée, grammaire française* (ib., 1900); Lebaigue, *La réforme orthographique et l'Académie française* (ib., 1898); also two pamphlets by M. Bréal and L. Havet, and the organ of the society for orthographic reform, *Le Réformiste*, ed. by J. S. Barès. The text of the edict of the Minister of Public Instruction, in February, 1901, has been republished by the American Book Company. For phonetics, early period, consult the authorities referred to under ROMANCE LANGUAGES; also Thurot, *De la prononciation française depuis le commencement du XVIème siècle* (Paris, 1884); Wey, *Histoire des révolutions du langage* (ib., 1848); Génin, *Variation du langage français depuis le XIIème siècle* (ib., 1846); Lessaint, *Traité complet de la prononciation française dans la seconde moitié du XIXème siècle* (3d ed., Halle, 1890); Passy, *Les sons du français* (5th ed., Paris, 1899); Nyrop, *Manuel du français parlé* (1902).

Versification: Guicherat, *Traité de versification française* (Paris, 1850); Becq de Fouquières, *Traité de versification française* (ib., 1879); Souriau, *L'évolution du vers français au XVIème siècle* (ib., 1893); Tobler, *Vom französischen Versbau* (Leipzig, 1883); Théodore de Banville, *Petit traité de poésie française* (Paris, 1891); Aubertin, *La versification française et les nouveaux théoriciens* (ib., 1898); de Souza, *Le rythme poétique* (ib., 1892); Vanor, *L'art symboliste* (ib., 1889). The two last are in favor of symbolism.

FRENCH LITERATURE. Eighth Century. The earliest sources of information on Old French are the dictionaries or 'Glossaries' of Cassel and of Reichenau, the former giving translation of Romanic or Old French terms into Old Germanic, the second of Latin words into Romanic.

Ninth Century. The first Romanic text that has come down to us gives the oaths interchanged

at Strassburg in 842 between the two grandsons of Charlemagne, Louis the German and Charles the Bald, against their brother Lothair.

Tenth Century. The earliest literary documents which are in our possession have all a religious character; they are the "Cantilène de Sainte Eulalie" (a short song celebrating the martyrdom of the saint); the "Fragment de Valenciennes" (homily on the prophet Jonas); a poem on the Passion of Jesus Christ; a Life of Saint Léger.

Eleventh Century. A Life of Saint Alexis. To the end of this century belongs the flowering of the national epos, the *Chansons de Gestes*. These were long poems relating the heroic deeds of Christian knights (*gestes*, Lat. *gesta*, deeds); they seem to have been composed, in most cases, by the reunion of smaller popular songs. There is, however, considerable discussion on this point. At first the chansons were usually sung by the poets themselves, called *trouvères* in the north of France and *troubadours* in the south; later on this became the function of a particular class of men called *jongleurs* (*joculatores-jogleors*) or *ménéstrels*. Both the poets and the singers were for a while a great power in the society of the Middle Ages, as they were able to make and unmake the reputation of a baron by what they chose to sing of him or of his ancestors. Their influence has been compared to that of the newspapers of later centuries. They allowed themselves to be bribed, and the kings and the Church had to make severe laws against them. This, however, was not the case from the beginning. The authors of the chansons drew their inspiration mainly from three different sources, and their poems belong accordingly to one of the three groups known as the French, the Breton, and the Classical Cycles.

The *Cycle de France* deals especially with French heroes who had put their arms at the service of God and the Church. The central figure is Charlemagne, who is made the great champion of Christianity. The task ascribed to him is the same as Christ's—to conquer the world for God. The great Emperor was represented as surrounded by his vassals, as Christ by His disciples. There were twelve chief barons, the peers of France, as there had been twelve Apostles; one of the Apostles had been a traitor, so there was a traitor (Ganelon) among the twelve peers. God repeated in favor of His kingly servant the miracles He performed formerly for His chosen people. He stopped the sun in its course in order to allow the Christian knights to complete the extermination of the pagans, and at times He sent down His angels to deliver heavenly messages and to help His soldiers in case of great danger. The most ancient, beautiful, and famous of the epics of this group is the *Chanson de Roland*, composed probably at the end of the eleventh century, containing about 4000 verses, whose author is not known. The rear guard of Charlemagne, headed by Roland, is attacked and cut to pieces in the pass of Roncesvalles, in the Pyrenees, and none escape. It is on this rather thin theme that legend worked and brought forth the great chanson in three parts: the betrayal of Roland by Ganelon, the death of Roland at Roncesvalles with the eleven other peers and 20,000 men, and the avenging of Roland achieved by Charlemagne. The sincere Christian spirit

underlying the whole poem is wonderfully well shown in the beautiful figure of the bishop-knight Turpin. Other remarkable chansons of the Cycle de France are: *Aliscans*; *Raoul de Cambrai*; *Garin le Lorrain*; *Les quatre fils Aymon*; *Ogier le Danois*.

The *Cycle de Bretagne* betrays an altogether different spirit, as already shown by the second title often given to it, *l'Épopée courtoise*. Its chief poet is Chrétien de Troyes. Chivalrous deeds are here still in great honor; but they are no longer performed for the sake of God and the Church and 'la douce France.' A true Christian spirit is rarely present, despite the frequent allusions to the Bible or to ecclesiastical customs, and the use made of certain pseudo-evangelical scenes, as, for instance, in the rather extraordinary fusion of the originally pagan legends of Brittany with the Christian legend of the Holy Grail in the last and unfinished poem of Chrétien de Troyes, *Perceval le Gallois*. Love, conceived of as the source of all human virtues, and impersonated in fair ladies, may be said to be in this cycle the only power which claims the devotion of knights and barons. The central figure is here Arthur, or Artus, King of Brittany. He also is surrounded by twelve peers, with a traitor (Mordret). The twelve peers are seated at a round table, the symbol of the perfect equality of them all, hence the name of Knights of the Round Table often given to them. The principal poems of the cycle are: *Lancelot du Lac*; *Ivain le chevalier au lion*; *Erec et Enide*; *Merlin*; *Tristan*; *Perceval*. In no one does the spirit of the whole cycle come out in its good and bad features so clearly as in the romance of *Tristan and Iseut*. Under strict orthodox appearances the fundamental ideas at work are worldly love and pagan fatality, as shown in the symbolic passion-breeding-philtre, and in a number of other elements borrowed from the world of magic and of the fairies. Shorter poems, treating Breton legends, are in close connection with the *Épopée courtoise*. They are called the *lais Bretons*, and were sung like the epics. Here the influence of the Church has almost completely disappeared even in words. Love is the only motive, and the *esprit chevaleresque* in the modern sense of the word comes out still more unhampered than before, and even with a foretaste of *préciosité*. The scenes are laid in Brittany or in Wales. Marie de France is the author of these graceful poems. The best known, most refined, and at the same time most characteristic of her manner are: *Eliduc*; *Les deux amants*; *Le rossignol*; *Lyonec*. Among the *lais* of other authors may be mentioned *Tydorel*; *Guingamor*; *Graelent*; *Doon*; *L'Épine*. To the same kind of literature, although the heroes are not from Brittany, belongs *Aucassin et Nicolette*, a 'chante-fable' of the twelfth or thirteenth century. It gives, half in prose and half in verse, the story of the love of a noble's son for a slave girl, who finally turns out to be a king's daughter.

The *Cycle antique* is the least important of the three groups of epics. The authors turned to antiquity to find new material for their poems; they Christianized Agamemnon, Achilles, Ulysses, and all the heroes of Thebes, Troy, and Rome. The best known among their production is the *Roman d'Alexandre*, which contains some most extravagant adventures. It was written probably

in the twelfth century, by Alexandre de Bernay, has 12,000 verses of 12 syllables, instead of 10, as in the *Cycle de France* and the *Cycle Breton*. The *Roman de Thèbes* and the *Roman de Troye*, belonging to the same group, are composed of octosyllabic lines.

All this mass of epic and chivalrous literature dealt with heroes taken from the higher classes of society, and was more particularly written for the nobility. There existed, however, simultaneously a more popular literature. Its products are less pretentious, but just as important as expressing the spirit of their epoch. They are short stories in verse. A good many among the earliest that we possess betray the absolute control of the Church over literature. The purpose of the *contes dévots* or *contes pieux* was to foster faith among the people and at the same time to bring some consolation for the hardships of life to the lowly. The saints and especially the tender, compassionate Virgin prove always ready to fight the devil or intercede with God in behalf of faithful servants of the Church. As the Church lost its empire over souls, and lay authors began to write, the stories that were written assumed a more worldly character. If a few of the innumerable *fabliaux* or *fardeaux* of the Middle Ages may be called didactic, by far the greater number have no other purpose than to entertain. Some are really artistic and graceful, with that touch of satire which is characteristic of the French people; but often the wit and humor are spoiled by coarse realism. Among the best may be mentioned the *Lai d'Aristote*, *Lai de l'oyselet*, *La housse partie*, *Le vair palefroi*, *Le vilain mire* (the original of Molière's *Médecin malgré lui*). The *fabliaux*, in which the talent for story-telling of the French nation is for the first time clearly shown, flourished especially during the twelfth and thirteenth centuries. They became rare in the fourteenth. Some of them were used at that time as themes for the stage, but most of them disappear temporarily, to be used again in prose two centuries later.

The satire on the different classes of society makes its appearance on a large scale during the same period in two long poems, *Le roman de Renart* and *Le roman de la rose*. The first is an animal epos of about 32,000 verses, not counting the 'branches' which were added later, and which would raise this number to over 100,000. The clergy, nobles, and villains are mercilessly criticised, though seldom with bitterness. Several collections of ancient animal fables written in Latin and known under the name of *Ysopets* (corruption of *Esopets*, or little *Æsop*), together with the *Bestiaires*, compositions ascribing moral traits to real or fantastic animals, had prepared the way for this kind of literature. Marie de France had translated a collection of fables into French verse. There are two sworn foes in the *Roman de Renart*: Isengrin, the wolf, and Renart, the fox, symbolizing strength and cunning. The general idea underlying the different episodes is that evil reigns supreme over society, brute force crushes weakness, cunning alone can overcome strength. In the *Roman de la rose*, allegory goes still further: the abstract ideas themselves are personified. A lover wishes to pick a symbolical rose, which grows in a symbolical garden. He is helped in his under-

taking by Bel Accueil, Doux penser, Espérance, etc., meanwhile fighting Danger, Male bouche (slander), Jalousie, and so forth. The author of the first 4000 verses, Guillaume de Lorris, had left the poem unfinished. His sole thought had been to offer in a poetical form a kind of code of love. But, fifty years later, Jean de Meun added 18,000 verses, in which, with abundant scholarly references to Ovid and other ancient authors, he directed venomous attacks against women, and the conventional affected and false forms that love had assumed at this period, more especially in the higher classes of society. The success of the *Roman de la rose* was considerable not only in France, where its influence continued far into the seventeenth century, but all over Europe. Imitations and translations appeared everywhere.

Lyric poetry attained a great measure of popular favor during the Middle Ages, at first more particularly in the south of France. But a great number of ballades, pastourelles, chants-royaux, triolets, lais, virelais, sirventes, motets, were lost. We know, however, about 200 names of authors; moreover, 600 of these short poems have come down to us anonymously. There were a great many academies named Puys which encouraged lyric and sometimes dramatic poetry by organizing contests and awarding prizes. Among the poets that we know, a special mention is due, in the thirteenth century, to Thibaut, Count of Champagne and King of Navarre, and Colin Muset, an itinerant minstrel; and in the fourteenth century, to Christine de Pisan, Eustache Deschamps, Guillaume de Marchault, and chiefly to Rutebeuf, a Parisian trouvère of the Bohemian type, who took great interest in the events of his time, crusades, Church discussions, and university matters; besides his little masterpieces of lyric and satiric poetry, he wrote a few *contes dévots*, *fabliaux*, and a miracle play. In the fifteenth century, Charles of Orléans, after his return from England, where he was a political prisoner for twenty-five years, and where he wrote most of his poems, made his brilliant court an asylum for letters and art. The greatest of these lyric poets up to the sixteenth century was François des Loges, known to fame as Villon. Owing to the resistless charm of his verses, to his absolute sincerity and spontaneity of inspiration, he has more than once been regarded as a kind of patron saint by the lyric poets of the nineteenth century. His chief compositions are two collections of short poems, *Le grand Testament* and *Le petit Testament*.

The theatre is the field in which the evolution of literature during the Middle Ages is most clearly shown. At first an institution of the Church, it gradually severed its connection with it, until finally theatre and Church came to be mortal enemies. The *dramas liturgiques* of the eleventh century were representations in the churches of biblical scenes, more especially of the nativity and passion of Christ. They were written in Latin prose, and composed exclusively of sentences of the Holy Scriptures. Moreover, the actors were all *clerici*, that is, officers of the Church. Then came, in the twelfth century, the *drame profane* or *sécularisé*. The scenes are still biblical, but imagination is permitted to play a greater part; the language is no longer Latin, the actors are laymen, the stage is removed from

the church to some public place. The *Représentation d'Adam* is the only piece preserved in its integrity that belongs to this early period of the French stage. The scenes are episodes from the book of Genesis. They are followed by predictions by the prophets of the coming of Christ, and the performance ends with a sermon describing the terrible signs which will form a prelude to the Last Judgment. In the thirteenth century the scope of the theatre is extended by the addition of miracle plays illustrating the marvelous deeds of the saints and especially of the Virgin. Rutebeuf has put in dramatic form the old fabliau of Saint Théophile, whom Mary frees from the clutches of Satan. *Le jeu de Saint Nicolas*, by Jean Bodel, another miracle of the same epoch, offers several scenes which have nothing to do with religion. Even a few purely comical pieces, such as *Le jeu d'Adam ou de la feuillée*, by Adam de la Halle, are now represented, though they seem to be an exception.

In the fourteenth century, which, on account of continual political and social disorders, was rather poor in literary productions of any kind, no new step toward emancipation from the Church is noticeable. The *Miracles de Notre Dame* remained the favorite theme, while scenes for religious plays are borrowed from all quarters, even from the *chansons de gestes* and *romans d'aventure*.

No form of literature is more popular during the fifteenth century than the theatre. *Mystère* is the name given henceforth to religious and even, though rarely, to non-religious plays, as for instance the *Mystère du siège d'Orléans*, which represents the rescue of that city by Joan of Arc, and the *Mystère de la destruction de Troie*. A feverish interest in theatrical representations took hold of the people at that period. The *mystères* were put on the stage with most elaborate machinery. Some of them had over 50,000 verses and lasted several days. Kings, nobles, and bourgeois vied with one another in their zeal for these plays. There was, however, something artificial about this universal enthusiasm; the plays are prolix; moreover, a tasteless abuse of the comic and coarse elements clearly indicates that the genre had outlived itself. In 1548 the Government had to withdraw the license to play from the 'Confrères de la Passion,' a society of actors in Paris, on account of the lack of decency in these so-called religious performances, and thus put an end to the mysteries. On the other hand, the profane theatre, free from the influence of the Church, was then coming to the front full of life and vigor.

The three principal kinds of plays in the second half of this century are the *moralités*, the *farces*, and the *sotties*. The *moralités* are a genre between the religious and the comic; sometimes grave, sometimes gay, they have a didactic purpose; frequently the characters are allegorical, like those of the *Roman de la rose*, which had set the fashion. The *farces* correspond on the stage to the *fabliaux* in the evolution of the verse story-telling; they are mildly satirical, the main purpose being to amuse. Coarseness is a common feature. Here belongs the first masterpiece of the French comic theatre, *L'Avocat Pathelin*, the author of which is not known. The sincerity of its humor and the keenness of its psychological observation are remarkable. The

moralités and the *farces* were performed by special associations, such as the 'Confrères de la Basoche,' in Paris. The *sotties* were played by the 'Confrères des Sots' (fools), who only assumed the guise of folly as a stalking-horse for their wit, and for attacks on the clergy, nobility, and all other great personages of the day. Originally they were merely farcical interludes of the mysteries, but owing to their revolutionary character they had to be removed from the latter, and thus acquired independent existence.

Except in one domain, that of history, one may well say that prose does not count in French literature before the sixteenth century. Translations are few. The long *romans d'aventures* that have enjoyed a certain popularity since the thirteenth century are nothing but dreary, prolix repetitions in prose of the *chansons de gestes* and *épopées courtoises*. Leaving aside Wace's *Roman de Rou*, also called *La geste des Normands*, which is a treatment in verse of the history of the Dukes of Normandy during the tenth century, there are only a few historians deserving of mention: in the twelfth century, Villehardouin, who relates, in his *Histoire de la prise de Constantinople*, the story of the fourth Crusade, in which he personally took part; in the thirteenth century, Joinville (*Mémoires sur la vie de Saint Louis*), one of the vassals of Louis IX., whom he accompanied in his first expedition to the Orient; in the fourteenth century, Christine de Pisan (*Vie de Charles V.*), Alain Chartier (*Histoire de Charles VII.*), and especially Froissart, who in his *Chroniques* gives a somewhat disconnected but most vivid picture of the brilliant period of the Chevalerie (his authorship of many of the best chapters is now questioned); in the fifteenth century we have in the *Mémoires* of Commines the first connected account of political events from the point of view of a statesman; he has many ideas in common with Machiavelli, and is the precursor of many eminent philosophical historians in France, of the type of Bossuet, Montesquieu, Guizot, Thiers, Michelet, and Taine.

The sixteenth century was a period of transition, marked by the penetration into France of the ideas of the Renaissance. As regards the stock of ideas available for artistic purposes, it must be acknowledged that French literature had become rather thin since the time of the great epics. The studies of the classical authors came just in time to introduce a new stream of thoughts, and to inspire literature with a new life. In 1531 Francis I. had established the Collège Royal de France (now Collège de France), in which only Hebrew, Latin, and Greek were at first taught, other studies coming later. The influence of this institution was almost instantaneous, and a rich harvest of scholars was the result. Among them were such men as Budé, Daurat, Pierre de la Ramée, and especially two who acquired a world-wide reputation: Jacques Amyot, thanks to his admirable translation of the *Lives* of Plutarch, and Henri Estienne, the author of the *Thesaurus Lingvæ Græcæ* (a work of immense erudition for the time), of the *Traité de la conformité du langage français avec le grec*, and of the *Précélence du langage français*, in which he protests against the invasion of Italian idioms that was taking place at this

epoch, owing to the presence at Court of Catherine de' Medici. See FRENCH LANGUAGE.

The influence of the Renaissance was especially marked in the domain of poetry. The last poet in the manner of Rutebeuf and Villon was Clément Marot. In his epistles, ballades, elegies, epigrams, etc., we find the same wit and satirical humor as in the work of his predecessors. He was, however, by no means a stranger to the new opinions; his attitude in religious matters roused persecution, against which he had to take refuge in Italy, where he died. Moreover, his translations of authors like Vergil and Ovid prove his interest in ancient literature. But it remained for the poets of the next generation to give vent in their original compositions to the new spirit created by the Renaissance. Seven of them—the poets of the *Pleïade*, Daurat, du Bellay, Ronsard, Belleau, Jodelle, Baif, Pontus de Thiard—combined their efforts to bring about a new literary era. Their aspirations are set forth theoretically in du Bellay's *Défense et illustration de la langue française*, and practically in a great number of poetical writings. Ronsard is, by common consent, considered the head of the group. With the sole exception of tragedy, he endeavored to resuscitate all the genres of antiquity, even the epos (*La Franciade*), and furthermore adopted the Italian sonnet which had come in along with the Renaissance. The three directing principles of the school are: (1) their contempt for the light French poetry of the foregoing centuries, such as Villon's and Marot's; (2) their belief that one who wishes to do truly artistic work must study the ancients and imitate them; (3) their love for French vernacular. With regard to the last point, the work of the *Pleïade* has been long misunderstood. They have been accused of overloading French with strange words. On the contrary, they protested, as a matter of fact, against the tendency manifested by many unintelligent humanists to introduce into French a number of Greek and Latin terms which gave the language a false air of erudition, and made it heavy and inharmonious. A famous verse of Boileau on Ronsard,

"Mais sa muse en français parlait grec et latin,"

is responsible for the error of three centuries. The juster appreciation of the achievements of these poets, brought about by such authorities as Petit de Julleville, has destroyed the traditional belief in a supposed opposition between the views of the *Pleïade* and Malherbe. The latter, though himself convinced of his complete disagreement with Ronsard, was really aiming at the same goal, i.e. the purification and refinement of the French language and poetry. But while Ronsard was a true artist, who could rely upon his literary tact and feeling, Malherbe had the spirit of system, requiring rules in all places and at all times, to the detriment of spontaneity and inspiration. Malherbe's mantle was taken up later by Boileau, a man fashioned like him in the schoolmaster's world, and it is he who is responsible to no small degree for the stiffness of French poetry in the great century of its literature. The yoke of Malherbe was unbearable to most poets of real talent. Both Desportes and Berthaut followed Ronsard, while Mathurin de Régnier (the earliest representative of modern French satire) and Théophile de Viau deliberate-

ly attacked Malherbe, claiming the rights of freedom and originality.

On the stage, in the sixteenth century, there were a few rather awkward attempts at classical drama. Jodelle, one of the members of La Pléiade, entered the only field left untouched by Ronsard in his imitations of ancient literature, and wrote his tragedy, *Cléopâtre*, in which, for the first time in France, the three Aristotelian unities of place, time, and action were observed. Garnier followed in the steps of Jodelle. Larivey imitated servilely the Italian comedy, but had the honor to provide Molière with several suggestions.

In the domain of fiction, the short story in prose, already in favor in the fifteenth century when the collective work of the *Cent nouvelles nouvelles* appeared, is at its best with Marguerite de Navarre, the sister of Francis I. She wrote (perhaps not without help) the *Heptameron*, an imitation of Boccaccio's *Decamerone*. Part of her material is taken from the fabliaux. Bonaventure Desperiers, her secretary, cultivated with success the same genre. The art of story-telling is also remarkably exemplified in the *Mémoires* of Montluc and of La Noue, and in Brantôme's *Grands capitaines* and *Dames galantes*. Brantôme did for the society of his time what Froissart had done for that of the thirteenth century. The writer who succeeded best in absorbing all that is good in antiquity, without losing the grace and freshness of French wit and humor, is Michel de Montaigne. In his delightful *Essais* the philosophy and belief of the Middle Ages are compared with those of ancient civilization, and the result is the refined and gentle skepticism which has made the "Que sais-je?" of its author a watchword for many cultivated minds ever since. What Montaigne had said, with seductive art and complete freedom from pedantry, was repeated with all the apparatus of logical demonstration by his friend Charron, in *De la sagesse*.

When Rabelais, the greatest literary figure in the sixteenth century, appeared, the conditions all over Europe were exceedingly precarious and the prospect for the future very gloomy. France had not yet recovered from the Hundred Years' War; Rome had been sacked by the French troops, and the Pope was no longer secure in it; Germany was the prey of terrible religious disorders, the Peasant Revolt, and the movement of the Anabaptists; finally, the Turks were threatening Christianity in the East. Yet Rabelais had the courage to break out in Homeric laughter. In his *Histoire de Gargantua et de Pantagruel* he ridiculed the murderous political wars of the time, the quarrels of the Church and of the different ecclesiastical orders, the pretentious and shallow erudition of the scholars, the revolting method by which magistrates and judges rendered justice—in short, all the abuses and follies of the turbulent times, which then marked the course of European civilization. But he is not content with negations; his keen good sense suggests to him a number of useful reforms in all the domains of life, education, science, religion, politics. Some of these reforms have been realized, some of them we are still striving to bring about. The greatest social power in the Middle Ages, the Church, had been severely shaken. At this moment the Reformation appeared upon the scene of which Calvin was chief exponent in

France. He was so full of the idea of the absolute authority and power of God, that in his *Institution chrétienne*, a masterpiece of logic and deep faith, he does not shrink from the extreme consequences of the theory of predestination. His efforts against Rome were ably supported by Théodore de Bèze, and especially Agrippa d'Aubigné, a man of wonderful personality, who fought with enthusiasm and untiring energy, with sword and pen, against the power of the Pope. His poem in seven cantos, *Les tragiques*, is one of the most powerful outcries of indignation the world has ever heard. To meet the danger of the domination of the League, a few devoted citizens (among them Pierre Pithou, Gillot, Passerat, Rapin) wrote a number of short pieces in prose and verse, in turn satirical, eloquent, comic, and grave, appealing to the patriotic feeling of their countrymen. These compositions were published in book form in 1594 under the title *La satire mérippée*. Another political writer of the same epoch was La Boétie, the friend of Montaigne, who in his book *Traité de la servitude volontaire* expressed even then opinions which were formulated two centuries later by Rousseau and by the leaders of the French Revolution.

The seventeenth century is known as the classic century of French literature. It differs from the sixteenth in its greater unity. It carried the French language to a point of literary perfection, a form that will be difficult to surpass. Two institutions more particularly contributed to this result: the Hôtel de Rambouillet and the Académie Française. The Marquise de Rambouillet brought together in her salon the most refined and cultivated people of Paris, and thus exerted a beneficial influence, moral, social, and literary. There Balzac, 'le seul éloquent,' first gave utterance to the great French 'période oratoire,' while Voiture was the foremost representative of the witty, light, amiable side of the French character. Other salons were formed on the model of the Hôtel de Rambouillet; that of Mlle. de Scudéry (*les samedis de Sapho*) deserves special mention. The habitués of these salons are the 'précieux' and 'précieuses' of whom Molière was so ridicule so amusingly; yet one must not lose sight of the excellent refining results of these coteries. They are apparent, for example, in the *Lettres* of Madame de Sévigné, and in many other representatives of *Le style épistolaire* in that century and the next.

The Académie Française was first a private society of scholars, then transformed more or less willingly, in 1635, at the instigation of Richelieu, into an official State corporation. The Academicians were to publish a dictionary, a grammar, and a rhetoric. The dictionary alone was completed. Vaugelas, the author of the *Remarques sur la langue française*, contributed more than any other to this work. Among the other original members of the Académie are Conrart, its first president; the poets Chapelain, Maynard, and Racan; Balzac and Voiture; and Furetière, who was expelled for having published a dictionary before that of the Académie.

The great authority in literature, however, was neither the Hôtel de Rambouillet nor the Académie, but Boileau, who, with an undeniable critical talent, made and unmade reputations at will, seldom going astray in his judgments. Like

Malherbe, he formulated in his *Épîtres* and in his *Art poétique* a code of literature; whatever did not meet its requirements was pitilessly condemned. Poets like Théophile de Viau and Scarron, the creator of the *genre burlesque* (*Virgile travesti*), are among his victims. He had nothing but contempt for Ronsard and his school, and yet he himself accepted the ancients as the criterion of excellence and even became the chief advocate of classicism in the great 'Querelle des anciens et des modernes,' which raged through many years of the seventeenth century; while Perrault, who had started the debate, was the principal representative of the 'modernes.' Proceedings of so imperious a character were only the application to the field of literary criticism of the principle of authority which regulated the whole life of the seventeenth century, social, ethical, religious, artistic. If France received strong political unity at the hands of Richelieu and Louis XIV., it was at the expense of that individuality which had characterized so many authors of the anarchistic sixteenth century. Protestantism had been crushed out, not so much on account of its intrinsic defects as by reason of political necessities. Everywhere the same system of government prevailed: anything threatening to become *imperium in imperio* was doomed to suppression or transformation, while only what accepted and reflected directly or indirectly the social ideal of the time was allowed to develop. Bossuet was really the incarnation of his century in literature; the authority of God, the authority of the Church, the authority of the King, are the themes of his works, and the grandeur which cannot be denied to this epoch can be seen in each sentence written by the 'Aigle de Meaux,' whether in his splendid *Oraisons funèbres*, *Sermons*, and *Discours sur l'histoire universelle*, in which the great of this world are like dust before God, or in his *Histoire des variations des églises protestantes*, and his attacks on Fénelon and Quietism, in which he affirms the absolute control of truth by the Roman Catholic Church, or yet again in his *Déclaration du clergé de France*, in which he defends the claims of the Gallican Church to certain liberties from papal jurisdiction. The same is true of his contemporary Bourdaloue, even more famous than Bossuet in those days for his pulpit eloquence, and, though to a less degree, of Fléchier. Even Fénelon, 'le cygne de Cambrai,' by humbly accepting the condemnation by Rome of his *Essais sur les maximes des saints*, showed how deep-rooted the idea of social and ecclesiastical hierarchy was in the temperament of that remarkable epoch. He had also to learn by bitter experience what it cost to suggest (in the *Voyage de Télémaque*, written for his royal pupil, the Dauphin) modes of government which did not agree with the autocratic ways of Louis XIV.

In the drama the notion of authority takes a somewhat different form, but is as much emphasized as in Bossuet. Corneille's tragedies, *Le Cid*, *Horace*, *Cinna*, *Polyeucte*, and his comedy *Le menteur*, preach an unconditional surrender to the laws of honor and conscience, of God and the State. Racine, though his artistic tact raised him in many respects above the narrow spirit of his age, is not free from it, nevertheless, as is well shown in his fundamental thesis of the submission of man to his passions (*Andromaque*,

Phèdre, *Iphigénie*, *Bérénice*, *Britannicus*), and in his illustrations of the omnipotence of God in his later religious plays, *Esther* and *Athalie*.

There are, however, a few men in the seventeenth century who do not assume this attitude of deference to conventional grandeur and worldly power. Chief among these is Molière (pseudonym for Jean Baptiste Poquelin), who attacks in his comedies, on the one hand, the *idola fori* of his contemporaries, as for instance the current affections of the society of his day (*Précieuses ridicules*, *Femmes savantes*, *Bourgeois gentilhomme*), and the false erudition of scholars, especially ignorant physicians (*L'amour médecin*, *Médecin malgré lui*, *Malade imaginaire*); and, on the other hand, the general views of humanity, as in *L'avare*, *Tartufe* (religious hypocrisy), *Don Juan* (affectation of unbelief), and *Le misanthrope*, his masterpiece.

Descartes refused to accept the traditional Catholic foundations of metaphysics. He invented a system of his own, resting on the proposition "Je pense, donc je suis" (I think, therefore I am); but he had to take refuge in Holland, in order to complete and give free expression to his new philosophy—a creed not so different from the orthodox as might be imagined if we were to form our judgment solely from the negative part of the doctrine (*Discours sur la méthode*, *Méditations philosophiques*, *Principes de philosophie*, *Traité des passions de l'âme*). Thanks to a most cautious and subtle way of expressing himself, Malebranche, Descartes's pupil, was able to publish his long treatise *De la recherche de la vérité*, and remain in Paris without being prosecuted. In the line of theology the whole group of the Jansenists, who resembled in some respects the Protestants, especially in their hostility to the teachings of the Jesuit Order, was subjected to persecution. They produced some of the most powerful and original writers of the time: Antoine Arnauld, Pierre Nicole, and, above all, Pascal, who has often been called the most profound of French thinkers. His literary bequest is the *Pensées* (notes prepared for a work on the truth of the Christian religion and published after his death), and the *Lettres provinciales*, a most forcible and effective satire on the Jesuits. Among the moralists of this epoch are La Bruyère (*Les caractères*, *Pensées*) and La Rochefoucauld (*Maximes*); better described perhaps as clever piecemeal psychologists than as powerful ethical philosophers. Madame de Maintenon, in her letters, deals chiefly with problems of education. Though a progressive spirit is shown in some of her theories, she is on the whole, like Fénelon, a being of her time.

La Fontaine, whom his contemporaries nicknamed 'Le bonhomme,' is a writer of marked originality. In his charming *Fables* and in his *Contes* (which remind one in their substance and form of the old *fabliaux*) we have once more a representative of the genuine 'esprit français' as it existed before the Renaissance. He had fed on all the poetic treasures of antiquity that came in his way, and created them, as it were, anew, by his graceful, light, and artistic verses.

Another man who freed himself from the conventionalities of the seventeenth century, and restored the connection with the national artistic tradition of France, is Charles Perrault, the author of the naïve and humorous nursery tales.

His *Contes* found hosts of imitators, even late into the eighteenth century.

The numerous novels of this period also indicate a revival of the literature of the Middle Ages, particularly in the style of the *Roman de la rose*. But the reconciliation of natural feelings and conventionality is here far from being so complete as in the writings of the two authors just mentioned. The lack of harmony between the two tendencies is disagreeably in evidence in all these tedious novels, many of which extended to ten volumes. The only outcome of their efforts is an intolerable sentimentalism expressed in the exasperating jargon of 'précieuses,' who play their parts in the garbs of shepherds and shepherdesses. Let us mention only La Calprenède, and Honoré d'Urfé (*L'Astrée*), and Mlle. de Scudéry (*Le grand Cyrus*, *Clélie*), who invented the *Carte du tendre* (map of tender feelings), and did in prose what Racan in his *Bergeries* had done in verse and in drama. The first example of the French novel, in the modern sense of the term, is Mme. de la Fayette's *Princesse de Clèves*, but it stands by itself. Coarseness disfigures Cyrano de Bergerac's satirical *Histoire comique des états du soleil et de la lune*, and his comedy *Le pédant joué*. Scarron's *Roman comique* is a faithful picture in the form of fiction of an actor's life in the century of Molière.

The memoir literature continues to enjoy favor in France. La Rochefoucauld and the Cardinal de Retz are the two best representatives in this field at this time.

We reach the threshold of the eighteenth century with the *Mémoires* of Saint Simon, who portrays in a lively style the still brilliant, but now thoroughly corrupt, Court of the last years of the 'Roi Soleil.' Although rotten at the core, so strongly organized a society as that created by Richelieu and Louis XIV. could not fail to hold together for a time. Everything, literature included, continued for a while on the old lines, and until far into the eighteenth century we have nothing but a servile imitation of the seventeenth century. Regnard and Dancourt are imitators of Molière; Crébillon takes up the bequest of Corneille and Racine; Chamfort and Rivarol once more echo the spirit of the 'précieuses'; Florian sometimes reminds one of La Fontaine; Massillon follows in the steps of Bossuet, and d'Aguesseau is a master of pompous style in political eloquence. J. B. Rousseau and his disciple Lefranc de Pompignan are lyric poets whose writings are in the style of the earlier century; the same is true of Louis Racine, the son of the great dramatist, and also true perhaps of Gilbert; it is only at the end of a life which spanned the century that even Fontenelle learns to appreciate the aspirations of the new generation in his work of popular science, *De la pluralité des mondes*. Besides those just mentioned, a number of authors spend remarkable gifts in fruitless activity. Their works, although sprightly and witty, hardly contributed anything toward progress in literature and art. Among them are Marivaux, who wrote exquisite comedies; Piron, Gresset, even Nivelle de la Chaussée, with his *Comédie larmoyante*, and Ducis, who tried to introduce Shakespeare into France. At the same time there are on the stage a few plays which announce clearly enough

the times that are approaching. Le Sage, in his bitter *Turcaret*, and Destouches, in *Le glorieux*, expose the moral unworthiness of those who claim to rule over their fellowmen by divine right; while Diderot, in *Le fils naturel*, Sedaine, in *Le philosophe sans le savoir*, and Beaumarchais in *Figaro*, already affirm deliberately the merits of the bourgeoisie. In his drama *Charles IX., ou L'école des rois*, M. J. Chénier directly attacks monarchy as a system of government. And soon after, the brother of the latter, André Chénier, strikes his lyre in favor of the newly conquered liberty; he was, however, to pay with his head for the indignant and patriotic protests that he uttered in his *Jambes* against the horrors of the Terror. Three other descriptive poets, contemporaries of Chénier, call for a passing mention here: Delille (for his poem *Des jardins*), Lambert (*Les saisons*), and Roucher (*Les mois*). The gospel of tolerance gains ground daily, thanks to works like Le Sage's *Gil Blas*, and Marmontel's *Contes moraux*, *Bélisaire*, and *Les Incas*, in the domain of the novel, while men like the Abbé Fleury and Rollin in education, and Vauvenargues in ethics, slowly and quietly suggest positive reforms.

If the list of highly talented men in the eighteenth century is very long, that of writers of real genius is short, as compared with the preceding period. At the opening of the century there is Bayle, the scholarly and bold author of the *Pensées sur la comète*, and of the *Dictionnaire historique et critique*. As early as 1697 all the traditional doctrines that will be swept away by the Revolution are made a target for his dialectic, and many new ones are announced. He was a precursor of Voltaire. Besides the advantage of a timely appearance, Voltaire had the considerable advantage of a clear and beautiful style. He is the incarnation of the eighteenth century. In one part of his work, nevertheless, Voltaire plainly belongs to the group of continuators of the traditional and classical literature. His dramas, except a few like *Mahomet* (preaching tolerance), which betrays the age in which its author lived, are patterned exactly after those of the seventeenth century; his *Henriade*, an epic poem, is another specimen of a literature that belongs still more surely to the past; and the *Siècle de Louis XIV.* is the glorification of that France whose standards of life he contributed to tear down in so many other writings. In the *Essais sur les mœurs et l'esprit des nations*, he takes up history at the point where Bossuet had left it in his *Discours*, namely with Charlemagne; but while Bossuet had shown that religion is the great leading power of a progressive world, Voltaire proceeds to prove that religion is the mother of all crimes and has positively prevented progress. Voltaire's criterion was plain common sense, and from this stronghold he attacked indifferently the methods by which he considered that the Church took advantage of the imbecility of human nature (*Lettres philosophiques*), the theistic and optimistic systems of philosophers and theologians, particularly the doctrine of the best possible world of Leibnitz and Shaftesbury (his poem *Le désastre de Lisbonne*, his *Contes philosophiques*, *Candide*, *Zadig*), and the men who deny the existence of God (*Si Dieu n'existait pas, il faudrait l'inventer*). His God, however,

is only that of Deism, i.e. a Creator who does not interfere with his creation; in other terms, he does not believe in Providence. Voltaire's action and influence are essentially negative. The only part of his work in which he does not attack others is that in which he tries to spread the scientific ideas acquired in his sojourn in England, especially those derived from Newton's books.

It is from England also, from the empirical philosophy of Bacon and of Locke (whose principal disciple in France was the Abbé Condillac), that the group of writers known as 'le parti des philosophes' borrowed the new conception of the world that they substituted for the traditional philosophy, which they had rejected. They embodied the results of their common efforts in the *Encyclopédie*. Diderot, who, though somewhat capricious, was one of the profoundest writers of the time, made this undertaking the work of his life, enrolling his most distinguished contemporaries as his collaborators. D'Alembert, the mathematician, wrote the *Discours préliminaire*, which established his fame as a writer. It is impossible to mention all those who were connected with the *Encyclopédie* and the 'parti des philosophes.' It is enough to name Mably, Raynal, Grimm, Helvétius, and Holbach. The salons of the time, conducted by a number of very keen and intelligent women, did much to spread the new beliefs. In the field of sociology and politics the most important writer is the Baron de Montesquieu. He began with a most happy and brilliant criticism of the customs of his countrymen in the *Lettres persanes*. Later, in the *Considérations sur les causes de la grandeur des Romains et de leur décadence*, and in his more elaborate work, *L'esprit des lois*, he does away with the merely speculative and *a priori* method of Bossuet in treating the philosophy of history, and replaces it by the empirical and comparative method which has since been applied with greater thoroughness, but not with greater skill or attractiveness, by modern ethnologists and sociologists. Duclos, in his *Considérations des mœurs du siècle*, has approached the same problems, though with much less genius.

The most far-reaching in its consequences of the philosophical principles of the eighteenth century was the return to nature. The affected cult of an unreal nature as it was found in the novels of the 'précieuses' had to go; and if we find an echo of it in Marie Antoinette's *hameau* at Versailles, no author of mark in the eighteenth century makes use of this old ideal. In 1735 the Abbé Prévost offered a first example of natural and passionate love in his novel *Manon Lescaut*, and a few years later the great naturalist Buffon proved that even in the society of the nobles a more truthful conception of nature was not excluded *a priori*. He had a mind of a most aristocratic form, and in his style continued the great traditions of the writers of the 'siècle de Louis XIV.,' yet he devoted his life to writing a monumental work, entitled *Histoire naturelle*, in which the nature that he studies with enthusiasm is one created by God, and not the one invented by ladies and gentlemen of the Court. Most of his opinions are no longer accepted, but they were original at the time, and well calculated to foster interest in a subject so long neglected by philosophers and scholars. Of a some-

what different character, but just as strong and sincere, was the love for nature as it appears in Bernardin de Saint Pierre's *Etudes sur la nature* and *Harmonies de la nature*, and in his romantic idyll *Paul et Virginie*. Full of chimerical ideas, both a poet and a Utopian, he might have been the most representative figure of his time in his chosen field had not Jean Jacques Rousseau forestalled him. An eccentric and restless genius, there can be no doubt that Rousseau provided not merely most of the ideas which the Revolution tried to put in practice, but also many of those that have been elaborated one by one in the literature of the nineteenth century by the romantic and even by the realistic schools. Extreme in everything, he wrote with an enthusiasm which could not fail to stir a society that had grown accustomed to hear only the dispassionate and cold speech of common sense and dry reason. Endowed with a strange combative disposition, he never rested till he had reached the very roots of the evils of his day; he was not content to attack any particular institution, Church, monarchy, or class privileges; his attacks were directed against society as a whole, and he declared the very system of civilization to be rotten, false, and contemptible. That man is a creature of nature, and that therefore nature must be his teacher, his mistress in everything, was with him a fundamental axiom. If he tore down in his *Discours sur les sciences et les arts*, *Discours sur l'inégalité*, *Lettres sur les spectacles*, he tried to reconstruct in the domain of education (*Emile*), in that of the family (*Nouvelle Héloïse*), and in that of sociology (*Contrat social*). The last mentioned is a treatise in which the author endeavors to trace the origin of every organized society to an original though tacit contract between all citizens; the latter freely decide as to the government they want. This implies not only taking away from the dominant class its privilege of ruling, but also the power of appointing and dismissing magistrates at will. The *Contrat social* became the Bible of the French Revolution; this was the authority to which it appealed when it justified the beheading of Louis XVI.

When the destructive storm of the great Revolution was over, Frenchmen realized that it was easier in theory than in practice to change an organization rooted in the tradition of hundreds of years. They were convinced, too, that the old society had not been absolutely bad in all respects. Accordingly, the first years of the nineteenth century appear as a period of reaction against the Revolution in the field of literature as well as in the field of politics. Joseph de Maistre preached in beautiful language on the unconditional return to the old régime, nay even to a mediæval theocracy. The belief in Providence was according to him the only satisfactory philosophy; the Church must rule over Europe, and kings be considered as the sacred representatives of God. Chateaubriand, though Catholic and Royalist, takes into consideration more than De Maistre the events of the eighteenth century. In his *Essai sur les révolutions* he maintains the uselessness of revolution, and later, having undergone terrible personal sorrows owing to the cruelties of the Terror, he finds consolation in the Christian faith ("J'ai pleuré et j'ai cru"). The *Génie du Christianisme*,

written soon after, offers a kind of æsthetic religion for artists rather than a religion for humanity at large. Yet it enjoyed an immense success with his contemporaries, who were tired of negations and greeted with enthusiasm the old belief—even though in a somewhat unusual attire. Chateaubriand, however, is not entirely reactionary; he proves a true son of the end of the eighteenth century when, after his journey to America, he professes a warm admiration for the life of the uncivilized tribes he had visited, and for the grandeur of the scenery (*Les Natchez*, *Atala*). He is also a forerunner of the Romantics in his half autobiographical story *René*, which with *Obermann* by Senancour and *Adolphe* by Benjamin Constant (the great orator of the Restoration), correspond in France to the note struck in Germany by Goethe's *Werther*. Madame de Staël's great achievement was the re-establishment of the connection with the eighteenth century, and especially with Rousseau; in fulfilling this task she shows hardly less passion or conviction than her master. In *L'Allemagne* she advocates the natural and rationalistic religion of Rousseau's *Vicaire Savoyard*; the same work brings out the idea of cosmopolitanism in the intellectual sphere of life which is to be found already in germ in Rousseau. The French Revolution had done away partly with political barriers; it seemed to Madame de Staël that a similar change must take place in the domain of art, and this prompted her to reveal the genius of Germany to her countrymen. Her two novels, *Corinne* and *Delphine*, defend—like the *Nouvelle Héloïse*—the natural rights of love against the conventions of social life. The Romantic movement, which has also been traced back to Rousseau, is the most important literary event of the nineteenth century. No writer of the time is altogether free from its influence. Its purest product is Lamartine. Individualism had won the great battle begun a hundred years ago: the *Méditations poétiques* and *Harmonies poétiques et religieuses* are like a glorious cry of victory crowning the efforts of the eighteenth century. No bitter experience had revealed as yet the deception that awaits the self-worshiper. One would wish that Lamartine had died before he descended from the heights into the arena of political intrigues and soiled his lofty aspirations by contact with reality. His political career was a failure, though—or perhaps because—he was sincere.

Very soon, taking advantage of its first successes, Romanticism assumed an aggressive attitude toward Classicism. Victor Hugo became the leader of the new school, and was joined by Gautier, Sainte-Beuve, Vigny, Musset, Nodier. The great battle by Hugo himself in favor of Romanticism took place on the stage (*Cromwell*, with its important preface, *Hernani*, *Ruy-Blas*, *Marion Delorme*, *Le roi s'amuse*). Alexandre Dumas, the father, and Vigny (in *Chatterton*) supported him. The old school, however, regained a temporary popularity with Ponsard's *Lucrèce*, a play weak in itself, but put upon the stage at the psychological moment when the enthusiasm of the public for Romanticism was beginning to cool. The triumph of Romanticism was in any case of short duration. Some of the most prominent writers of the group quietly withdrew (Sainte-Beuve, Gautier), while others

loudly voiced the bitter disillusion. The pessimistic but proud poetry of Vigny (*Poésies*) and the tragic youthful outcry of despair of Musset (*Les Nuits*, *Souvenir*) are the swan songs of Romanticism. In the domain of fiction, the passionate prose of the anarchistic George Sand (*Indiana*, *Jacques*, *Mauprat*) gradually lost its fervor, and in later years she abandoned the fanaticism of her youth, and sought the harbor of happiness in an old-fashioned, conventional society.

Ever since the Restoration, France has been in danger of a new era of revolutions, and the possibility of having to face another Terror led many to attempt a pacific settlement of the rising social and political difficulties. Among them were the poets Béranger and Casimir Delavigne; the political writers and orators P. L. Courier, Benjamin Constant, Royer-Collard, Lamartine; the historians Guizot, De Tocqueville, Thiers, Blanc, Michelet; the philosophers Cousin, Jouffroy; the socialist Proudhon; the Catholic writers Lacordaire, Lamennais, Montalembert. All the generous efforts of these men were finally brought to an end by the Revolution of 1848, followed three years later by the coup d'état of Napoleon III.

In the meantime, Victor Hugo's fame continued to increase. He was a giant well able to stand the final failure of Romanticism without being carried away in the disaster. Moreover, his conception of individualism had always been very different from that of Lamartine, Vigny, and Musset, and his understanding of the needed reaction against Classicism was more radical, more to the point, and also more according to the trend of ideas since the Revolution. This is the reason why he may be rightly considered the representative of the nineteenth century—the century of democracy—just as Voltaire was the high priest of the eighteenth. Hugo had endeavored to show that man is a tissue of contradiction, a mixture of good and evil, of beauty and ugliness, of grandeur and villainy, with the inference that a king or a nobleman has traits that make him, after all, a very inferior being, while—and this is the chief point—in the humble, the lowest in the social scale, are intimations of sublimity that render him the equal of the most highly honored among men. See particularly the dramas *Le roi s'amuse*, *Marion Delorme*, the novels *Bug Jargal*, *Notre Dame de Paris*, *Les misérables*, and, in the *Légende des siècles*, poems like "Les pauvres gens," or "Le crapaud." Not only are those traits not distinctly romantic, they are even characteristic of the school that was to replace Romanticism, namely, the Realistic. Another important feature that made Hugo a favorite with the masses is his optimism. Though a great satirist in *L'année terrible* and *Napoléon le petit*, his confidence in humanity and God was always predominant. This is, among others, the idea which inspires the whole *Légende des siècles*, poems in the epic style, in which the author wished to show how humanity rises constantly from a lower to a higher level of civilization and happiness.

Two other men in the first half of the century took pains to study man under both his ideal and his baser aspect, but, contrary to Victor Hugo's, their portrayals of characters have a pessimistic tone. The first of these is Honoré

de Balzac, who, in his stupendous *Comédie humaine*, is so anxious to remain faithful to life that, for fear of incurring the accusation of undue indulgence, he shows a strong inclination to lay stress on the weakness of man. The titles of his best-known novels are: *César Birotteau*, *Eugénie Grandet*, *Le lys dans la vallée*, *Peau de chagrin*, *Le père Goriot*, *Séraphita*. The second was Stendhal (pseudonym of Henri Beyle), who, in his detailed studies of the psychological springs of human action (*Chartreuse de Parme*, *Rouge et noir*), seems to have still more deliberately assumed the cynical tone of skepticism as to the very possibility of goodness. The public was not ready for Balzac and Beyle, and a whole generation was to pass away before their efforts were duly appreciated. The old standards had first to be disposed of, and this was the task performed by men like Mérimée, Flaubert, Gautier, Barbey d'Aureville, and the poet Baudelaire. In turn bitingly sarcastic and humorous, they indicated the shallowness and pettiness which the advent of the bourgeoisie had introduced into art. Flaubert, d'Aureville, Mérimée, and Gautier still select the characters of their stories for the most part in the sphere of the romantic, but the method of treatment is evidently realistic. Flaubert's *Madame Bovary* (1857) is in subject and treatment the first great novel of the Naturalistic movement of the third quarter of the century. The victories of science and the success of pessimistic philosophy did much to promote the ultimate triumph of the cause of Naturalism. In the seventies, Zola published the first novels of his series *Les Rougon-Macquart*. The sub-title of the work, "Histoire naturelle et sociale d'une famille sous le second empire," is suggestive enough. To the author, and to the brothers Goncourt, who immediately preceded Zola in this newly opened path, man is a mere product of his *milieu* and of the physical laws of nature, especially those of heredity; therefore he can be understood only by means of scientific study, and true literature must be nothing but a collection of scientific cases carefully recorded. Zola was himself the disciple of the philosopher Taine, who had put forth the principle of his system in the introduction to his history of English literature. But Zola had taken only one-half of the theory, laying stress merely on the physiological causes that influence action; another disciple of Taine, Paul Bourget, studied in his novels particularly man's mental mechanism, as Beyle had done earlier, and represents the 'roman psychologique,' as Zola the 'roman naturaliste.' Bourget was attracted by the study of the female character on account of its complexity; for the same reason he deals by preference with society women rather than with women of the people. His most characteristic novel is *Le disciple*; see also *Mensonge*, *Cœur de femme*, *Cruelle énigme*, *Duchesse bleue*. Two of the principal writers in the two domains of the naturalistic and the psychological novel are the genial Alphonse Daudet and Edouard Rod. They allow a touch of human feeling to animate their books, and therefore, although in some respects perhaps inferior from the artistic point of view, enjoy much favor with the bulk of the public. It is not always possible to decide whether an author belongs to one or the other of these two schools; this is, for instance,

the case with Ferdinand Fabre, and with novelists like Edmond About, or Cherbuliez. The extreme theories of Naturalism were soon given up. Five disciples of Zola—Rod among them—published a protest against their former master's conception of literature. Zola himself, in his *Trois villes* (*Lourdes*, *Itome*, *Paris*), renounced his pessimistic views of humanity, and in his four *Évangiles* (*Fécondité*, *Travail*, *Vérité*, *Justice*), of which only three had been written at the time of his death, the note of optimism and even of Utopianism is dominant. If Naturalism has died out, it has, however, left noticeable traces in the works of novelists up to the opening of the twentieth century. The brothers Rosny and the brothers Margueritte are almost direct descendants of Zola, with a slightly more pronounced tendency toward moralizing, while Maurice Barrès and Paul Adam, and L. Descaves discuss not only social but political issues. Again a tendency to use the psychological method is manifest in authors like Prévost, 'Gyp,' Estaunié, Mirabeau, and Hervieu. Theuriet, Bazin, and Pouvillon are realistic novelists of rustic life. The master of the naturalistic short story is Guy de Maupassant. Some view him as a greater writer than Zola himself. His sober style seems to be an improvement even upon that of Mérimée, who was usually considered the incomparable model in this field. The stories of Coppée may be mentioned here as belonging to the realistic style, tempered by deep sympathy with the working classes. Masson Forestier represents with talent the detective story. The names of Villiers de l'Isle Adam, Rémy de Gourmont, P. Louÿs, de Rémier offer the best examples of novels written by the modern Symbolists.

As to the stage, since the fight of Romanticism, we record the appearance of the prolific Scribe, and the original note struck by Alexandre Dumas, the son, and E. Augier, in their realistic, and at the same time hortatory, social dramas (*Dame aux camélias*, *Demi-monde*, *Fils naturel*, *Affaire Clémenceau* by the former, and *L'aventurière*, *Le fils de Giboyer*, *Maître Guérin* by the latter). They were the forerunners of realism in the drama. For years Labiche, Sardou, Meilhac, Halévy, and Pailleron contrived clever novelties to amuse the stage-goers. Meanwhile the theatrical ventures of Zola and Daudet had failed, and it was not until 1882 that Naturalism scored a triumph with *Les corbeaux*, by H. Becque. The success was, however, of short duration, for Naturalism degenerated soon into what has been called 'le théâtre rosse.' Since that time all sorts of plays have appeared on the Parisian stage; satirical by Lavedan and Donnay, social and moral by Curel, Hervieu, and Brieux. The most popular playwright has been E. Rostand. His *Romanesques* was a belated satire on Romanticism; in *Cyrano de Bergerac*, his greatest success, the satiric and serious elements are mixed in a most disconcerting manner; while *L'Aiglon* is a more or less happy attempt at historical drama; a genre cultivated also by Hennique, Coppée and Sardou. Finally, we should mention a group of artists specially characteristic of an epoch in which anti-naturalism is the dominant note: the Symbolists Villiers de l'Isle Adam, Saint Pol Roux, P. Claudel, and above all, Maeterlinck. The latter, however, has entered a more usual path in his *Monna Vanna* (1902). A resur-

rection of the Middle Ages, fashioned on its miracle plays, has also taken place on the eve of the twentieth century, with M. Bouchor and Vicaire; the *Théâtre de l'Âme*, by Schuré, also has a half mystical note.

The poetry of the last third of the nineteenth century illustrates remarkably well the oscillations of the literary ideals during this period. The spirit of Naturalism has made a deep imprint on the devotees of the Muses known as the *Poètes du Parnasse* or *Parnassiens*. Banville and Th. Gautier insisted above all upon a very accurate and, in appearance, scientific verse construction; a pornographic inclination is evident in Baudelaire's *Fleurs de mal*, a pessimistic note in Leconte de Lisle, and a psychological tendency in Sully Prudhomme; while one notices in Coppée, Richpin, Mendès, the general desire to draw on the lower classes of society for artistic material. Only fifteen years after the publication of the first volume of the Rougon-Macquart series and twenty after the foundation of the Parnassian group, a host of new authors came to the front, and spared no efforts to shake off the yoke not merely of the poets of the time, but of Naturalism itself. Some of these men, though essentially poets, wrote at times in prose. They called themselves *Symbolistes*, or sometimes *Décadents*, which title, however, was originally a nickname. Instead of looking at things as the Realists had done, they declared that the world is essentially a subjective creation, and that therefore objects and thoughts are better represented and conveyed by means of symbols than by an accurate description. The true field for art is not reality, but the sphere of mobile, subtle sensations and feelings. Symbolism is individualism carried to its extreme limits. They adopted a special vocabulary and a special system of versification. The latter culminated in the *vers libre*, i.e. the verse where nothing but the artistic feeling of the poet decides as to rhythm, number of syllables, and rhyme. The Symbolists recognize as their leaders Paul Verlaine and Stéphane Mallarmé, both of them former adherents of the Parnassian School; the best known are, besides the two already mentioned, Rimbaud, H. de Régnier, Viele-Griffin and Stuart Merrill (both American by birth), J. Laforgue, J. Moréas, G. Kahn, R. Ghil, Paul Fort. An important group has been flourishing in Belgium, Maeterlinck, Verhaeren, and Rodenbach being the chief members. In some prose authors, such as Huysmans (a former pupil of Zola), and the Sar Peladan, who has created the order of the Chevaliers de la Rose Croix, related tendencies have assumed the character of a vague artistic mysticism. These authors never succeeded in altogether gaining their point, the mass of the public being unable to follow them in such exoteric compositions. Therefore the next move has been a return to theories more accessible to the average mind. Groups of young poets, one in Toulouse, the other in Paris, have led the way in this new direction. They are known under the name of *Naturistes*. They speak highly of Zola, but while his attitude toward nature was purely scientific, they endeavor to bring out also its poetical aspects. There is nothing new in this vague pantheism itself, however original it may look after the extreme tendencies of Naturalism and Symbolism. Saint Georges de Bouhélier, M. Le Blond, and L. Balzacette are the principal

Naturistes. Another group of seventeen authors has been formed still later; their ideals are the same as those of the school just mentioned, but they are more mature poets. Their first manifesto was issued in the fall of 1902. It is a collective publication: *Les Poètes de l'école française; la foi nouvelle*.

Thus the swing of the pendulum becomes quicker and shorter as sects and schools spring up and die away. In reality the twentieth century opens without any prevalent literary ideal; it cannot be said, however, that any kind of artistic manifestation is altogether lacking. The most representative Frenchmen at the close of the last century seem to be the novelist P. Loti, with his vague impressionism, and Renan and Anatole France, whose chief characteristics are a refined dilettantism and amiable skepticism.

History in the second half of the nineteenth century has assumed a more and more scientific form of treatment, with Fustel de Coulanges, Renan, Taine, Lavisse, Sorel, and it is considered by many, probably with reason, as belonging no longer to the domain of literature. The same question has even been raised with regard to criticism. Since the admirable work of Villemain, D. Nisard, and especially Sainte-Beuve, there has been a strong inclination toward scientific criticism. Taine, and with a kind of fanaticism Hennequin, systematized it to such an extent as to make it render well-nigh automatic judgments. The reaction was not long in setting in. The two methods in vogue in the last decade of the nineteenth century were that of the dogmatist, like Brunetière and Doumic, who judge works of literature according to their agreement with an objective canon, and that of the impressionists, like Lemaitre and A. France, who allow themselves to be guided solely by their subjective feeling of the beautiful. Critics such as Faguet, Larroumet, Lanson, Pellissier, may be called intellectualists; they aim at impartiality, and support their opinions with rational motives. Among the rising stars in criticism in the first years of the twentieth century must be mentioned: C. Maclair, A. Beaunier, for their openness to new ideas, and E. Charles for his energetic and independent criticism.

We ought to speak before ending of a deep but almost unconscious conflict, independent of any artistic standard, between two classes of authors—those who endeavor to make literature conform to the tastes of the masses, thus yielding to the democratic spirit of the nineteenth century, and those who try to resist these efforts. Authors like Hugo have been frequently accused of pandering to the popular taste. The great successes in this low order of literature have lain in the domain of the novel. Foremost in this style is Dumas, the elder, whose *Monte Cristo* and *Three Guardsmen* are familiar to all English readers. Next to him, though not so famous, are men like P. de Kock, E. Sue, A. Karr, Ponson-du-Terrail, Gaboriau, Richebourg, X. de Montépin, Saintine, Souvestre, O. Feuillet, and G. Ohnet.

On the stage a deliberate step toward popular art has been taken by M. Pottecher, who has created in 1895 his 'Théâtre du peuple' at Bussang, in the Vosges. He has found many imitators at Gérardmer, Ploujean, Béziers, and other towns of France. The advisability of establish-

ing a similar institution in Paris has been discussed at length by the great French periodicals.

BIBLIOGRAPHY. *Histoire littéraire de la France*, begun by the Benedictines of Saint Maur, and continued by members of the Institut, of which 33 volumes have been published, coming down to the fourteenth century (1733-1898); Petit de Julleville (edit.), *Histoire de la langue et de la littérature française des origines à 1900* (8 vols., Paris, 1896 seq.); Nisard, *Histoire de la littérature française* (4 vols., Brussels, 1846-50, last ed. revised by the author, 1879); Albert, *Littérature française* (5 vols., Paris, 1886-87); also shorter histories by Lanson (ib., 1895); Brunetière (ib., 1898); Lintilhac (ib., 1894); Doumic (ib., 1896-99); and Faguet (ib., 1900). For individual authors, consult the excellent collection in course of publication since 1887 under the direction of J. J. Jusserand, *Les grands écrivains français*, and the *Collection des classiques populaires*, under the direction of E. Faguet (Paris, 1887-98). In German, Birch-Hirschfeld, *Geschichte der französischen Literatur seit Anfang des 16ten Jahrhunderts* (Stuttgart, 1889 seq.); Morf, *Geschichte der neuern französischen Literatur, XVI.-XIX. Jahrhundert* (Strassburg, 1898), which provides an excellent bibliography. In English nothing very satisfactory has been written covering the whole ground of French literature. The following may be mentioned: Van Laun, *History of French Literature* (London, 1883); Saintsbury, *Short History of French Literature* (ib., 1889); Dowden, *History of French Literature* (ib., 1897); Warren, *Primer of French Literature* (Boston, 1889); Kastner and Atkins, *Short History of French Literature* (Cambridge, 1901). For treatment of special literary genres not restricted to any one period, Morillot, *Le roman en France depuis 1610 à nos jours* (Paris, 1870); Petit de Julleville, *Histoire de la littérature dramatique depuis ses origines jusqu'à nos jours* (ib., 1889); Brunetière, *Les époques du théâtre français, 1636-1850* (ib., 1892). For special periods: Middle Ages, Ampère, *Histoire littéraire de la France avant le XIIème siècle* (1839-40; new ed. 1867); Gaston Paris, *Littérature française au moyen-âge* (ib., 1890); Aubertin, *Histoire de la langue et de la littérature française au moyen-âge* (2 vols., ib., 1876-83); L. Gautier, *Les épopées françaises* (4 vols., ib., 1878); P. Paris, *Les romans de la Table Ronde* (5 vols., ib., 1868-77); Bédier, *Les fabliaux* (ib., 1893); Lénient, *La satire au moyen-âge* (ib., 1859); Petit de Julleville, *Les mystères* (2 vols., ib., 1880); id., *Répertoire du théâtre comique en France* (ib., 1885); id., *Les comédies* (ib., 1885); G. Paris, *Légendes au moyen-âge* (ib., 1902); id., *Poésie française au moyen-âge* (ib., 1885); Jeanroy, *Origines de la poésie lyrique en France au moyen-âge* (ib., 1889). FRENCHMAN'S BAY. An ocean inlet in Hancock County, Maine, extending inland about 25 miles, with a width in some places of 10 miles (Map: Maine, G 7). Mount Desert Island forms the western side of the bay, and Bar Harbor, the most prominent resort on this island, is situated on its shore. It furnishes numerous good harbors, and contains a number of islands, chief of which are the Porcupine, Iron Bound, Jordan, Stave, Calf, and Hancock islands.

FRENCH POLITICAL PARTIES. See POLITICAL PARTIES, section on FRANCE.

FRENCH PROPHETS. A name given in England to certain Camisards (q.v.), who came thither from France in 1706, making extravagant claims of prophecy, the gift of tongues, ability to work miracles, etc. They preached communistic doctrines and announced the speedy coming of the Messiah's kingdom. For a short time they gained converts, including some persons of influence. Consult David Hughson (i.e. Edward Pugh), *A Copious Account of the French and English Prophets* (London, 1814).

FRENCH PROTESTANT CHURCH. See HUGUENOTS.

FRENCH REVOLUTION, THE. The Revolution of 1789 in France which overthrew the Bourbon monarchy and the old feudal régime. In this article the name is employed for the period of French history beginning with the meeting of the States-General at Versailles, in 1789, and ending with the establishment of the Consul-

ata, in 1799. For an account of the condition of France before the Revolution, and the causes that brought it about, see FRANCE.

When it was decided to summon the States-General, two important constitutional questions required solution—the distribution of representation among the three orders, and the method of voting in the States-General itself. Owing to the somewhat irregular character and procedure of this body, which had not met since 1614, there were no valid precedents which could be followed in 1789. In solution of the first question, a royal decree revived or created certain electoral divisions, and provided for the election of 250 delegations of four members each—one from the nobility, one from the clergy, and two from the Third Estate—thus dividing the membership of the States-General equally between the two upper orders and the Third Estate. Supplementary decrees provided for special cases which arose and considerably increased the number of members. In each electoral district, in conjunction with the election of the members of the States-General, each of the three orders drew up *cahiers*, or lists of grievances, including propositions for new legislation. The question of the method of voting was left unsolved, but the official expectation was that the vote would be by order, which would have required a majority vote of each of the orders to pass any measure. This would have been a bar to any vital measure of reform. The Third Estate, however, expected and intended to have a vote by head; that is, the three orders should vote as one body, and the simple majority should suffice to pass any measure. This would have placed the control in the hands of the Third Estate, which would vote as a unit, and could depend upon the support of a few liberal nobles and the considerable number of parish priests among the representatives of the clergy. When the States-General met, the nobility and the clergy organized as separate houses, but the Third Estate refused to take any such action, in spite of royal and ministerial pressure, and finally on June 17th declared themselves the National Assembly, and invited the nobility and clergy to take their own places in the Assembly. When the Third Estate first met on June 20th, they found their meeting-hall closed, but secured a place of meeting in the building called the Tennis Court (*jeu de paume*), where they took the famous oath not to dissolve until they had given France a constitution. The parish priests or *curés* and a few of the liberal nobles then joined the Third Estate. After the fruitless royal session of June 23d, in which the King commanded the three orders to meet separately, the remainder of the nobility and clergy, at the royal bidding, joined their fellows in the National Assembly, which came to be called the Constituent Assembly, because of its self-imposed task of framing a constitution. The leader of the Third Estate for the vote by head was Mirabeau (q.v.), an able but discredited noble who had secured an election as a representative of the Third Estate for Aix.

In July, under the influence of a few ultra-conservative and reactionary members of the royal family and of the nobility, the King assumed a hostile attitude, dismissed Necker, the Minister of Finance, in whom the hopes of a regenerated France largely centred, and concentrated troops on Paris. Insurrectionary move-

ments, by which the masses of the people began to show their interest, broke out in Paris. Blood was shed in the capital on July 12th, and on the 14th the Bastille (q.v.), the visible sign of generations of tyranny, was stormed and partially destroyed. The propertied classes and the business people of the city, to prevent the recurrence of bloodshed and riot, and to maintain order, organized a city militia, called the National Guard, and a provisional city government. The King, in alarm, withdrew the troops, recalled Necker, and in response to popular demand visited Paris, where he legalized the provisional measures, and recognized Lafayette as Commandant General of the New National Guard, and the astronomer Bailly as Mayor of Paris, and changed the national colors from the white of the Bourbons to the new and popular tri-color.

Having failed in their attempt to overawe the National Assembly and the people of Paris, the Count of Artois, the King's youngest brother, and other leading reactionaries left France, being the first of the so-called *Émigrés* (q.v.). Immediately following the capture of the Bastille, local disturbances broke out in many sections of the country, while other parts were swept by a panic, known as the "Great Fear." The old administrative machine had broken down, and the nation was without an effective local government. In each locality the cool-headed lovers of law and order organized companies of the National Guard, and established a provisional local administration.

On the night of August 4th a report on the condition of the nation was read in the Constituent Assembly by one of the Deputies, Salomon. This report was followed by the abolition of the old feudal and manorial privileges. The Assembly did not begin at once the necessary constructive work, but dallied with academic discussion on the rights of man, a declaration of which was adopted, to be a preface to the new Constitution. (See ASSEMBLY, NATIONAL.) The King and his ministers failed to show any ability to deal with the crisis, while the attitude of the Queen and the Court gave color to rumors and popular fears concerning the hostile designs of the King against reforms. This period of suspense was ended by another outbreak in Paris. A mob, composed largely of hungry women, after some disturbances in the capital, marched to Versailles on October 5th, followed by Lafayette and the National Guard. Lafayette rescued the royal family, but did not disperse the mob, and on the following day the National Guard and the mob escorted the royal family to Paris and quartered them in the Tuileries. The Constituent Assembly soon followed and found a meeting-place near the Tuileries. Thus far, the Assembly had been dominated by admirers of the English Constitution, like Mounier and Mirabeau, and by admirers of America, like Lafayette and the Lameths. Although there were some theoretical admirers of republican institutions, still, in practice, all had contemplated a constitutional monarchy for France. Now, the most conservative members of the Assembly began to disappear, and slowly more liberal principles developed. A symptom of this change was in the organization of clubs, the earliest and most important of which was the Society of the Friends of the Constitution, later known as the Jacobins (q.v.), from the old monastery in which its meetings

were held. The Jacobins became a great political force, because of their system of affiliated clubs in the provinces, with which they were in close communication. (See FEUILLANTS; JACOBINS.) Another important club in Paris was the Cordeliers (q.v.), under the radical leadership of Danton. Newspapers, as well as clubs, sprang into existence in 1789, for the censorship ceased to discharge its functions. These papers differed widely in form, regularity of issue, and character. In general their purpose was political and most of the space was occupied with accounts of the sessions of the Constituent Assembly. The most famous of the journals was the *Moniteur*; the most brilliant was the *Révolutions de France et de Brabant* of Camille Desmoulins, and the most erratic the *Ami du peuple* of Marat. On November 2d, the Assembly decreed the transfer of the property of the Church to the nation. In February, 1790, it abolished succession by primogeniture. In June, it suppressed all titles of nobility.

The work of drawing up the new Constitution went on apace in the Assembly, so that the first draft was accepted by the King on July 14th, 1790, the anniversary of the taking of the Bastille, at the Feast of the Federation in the Champ de Mars, in which representatives from all parts of the country participated. The Constitution gave the King a suspensive veto on all measures passed by the unicameral national legislature. The legislature shared with the King the control of foreign affairs. The most successful and most enduring portion of the new Constitution was the provision made for the reorganization of France into 83 departments, each with its local administration. All officials were to be elected by the people. Another feature of the new arrangements was equally important because of the opposition which it aroused. This was the Civil Constitution of the Clergy, which reorganized the Church upon the lines of the new civil administration and transferred the actual control of the Church from the hierarchy to the French State. The clergy were to be paid by the State and were required to take an oath to support the new arrangement. This caused a schism in the Church in France, because two-thirds of the priests remained loyal to the Catholic Church and refused to take the oath. The Assembly had already confiscated the estates of the Church and issued assignats (q.v.), or a kind of Government notes based upon these lands as security. The confiscated lands, comprising one-fifth of France, being thus placed suddenly upon the market, depreciated rapidly in value, and the assignats, owing to new issues, declined more rapidly. The only other important event of the summer of 1790 was the military mutiny at Nancy and its suppression by Bouillé (q.v.) on August 31st. Necker, to whom, of all the King's ministers, the nation had looked for wise and able measures, failed to accomplish anything, and retired from office in September, 1790, leaving the King without a single competent adviser. Mirabeau was the one man in public life who possessed real statesmanlike ability. Though viewed with suspicion by his colleagues in the Constituent Assembly, and with unconcealed contempt by the Queen and the Court, he attempted to place his talents at the service of the nation, through both the Assembly and the King. Though his advice was not accepted, the nation realized that his death, on April 2d, 1791, left France without a

single statesman to guide her. Worst of all, France was not to be allowed to solve her problems alone. The Queen was in constant correspondence with her brother, the Emperor Leopold II., the ruler of the extensive Hapsburg dominions. This was regarded by the people as treasonable. Both Leopold and Frederick William II. of Prussia regarded the events in France with suspicion, and desired to save the French royal family from humiliation and possible danger. German rulers had allowed the increasing numbers of the émigrés to gather within their territories, and threaten armed invasion of France to rescue the royal family and restore the old order. Contrary to the advice which Mirabeau had given, the King and his family escaped from Paris on the night of June 20, 1791, and fled toward the eastern frontier to take refuge with the émigrés under the protection of the Emperor Leopold. This confirmed the popular suspicion that the Queen was in treasonable correspondence with her brother, and that the King had perjured himself in swearing to support the new Constitution. The King and the royal family were halted at Varennes and brought back to Paris.

The summer of 1791 witnessed two unfortunate events which foreshadowed the evil days to come. The first was the unprovoked firing upon a popular meeting in the Champ de Mars, in Paris, on July 17th—an event known as the Massacre of the Champ de Mars. The other was the meeting at Pillnitz of Leopold II. and Frederick William II. in August, and the issue of a joint declaration intended as a warning to the popular party in France. Meanwhile the Constituent Assembly had revised the Constitution on more conservative lines and submitted the completed work, the Constitution of 1791, to the King, who took the oath to it on September 14th. A new legislature having been chosen according to the provisions of the new Constitution, the Constituent Assembly dissolved on September 30, 1791.

The new legislature, known in history as the Legislative Assembly, began its sessions on October 1, 1791. The Assembly was composed of about 750 members, chosen largely from the middle class, and included no one who had sat in the Constituent Assembly. There were no organized parties in the Legislative Assembly; but two small groups, one liberal and one radical, early came into prominence—the Girondists (q.v.), so named because their leaders came from Bordeaux in the Department of the Gironde; and the Mountain, who took this name because they occupied the highest seats on the left side of the hall. The majority of the members of the Assembly were moderates or even conservatives, but the Girondists were generally able to carry their measures. Unfortunately, the Girondists were theorists and orators, and included among their number no person of statesman-like character. Under the leadership of Brissot they became a republican party, and monarchy gradually became unpopular. Differences in regard to the nature of the proposed republic later arose between the Girondists and the Mountain, the one desiring a federal republic like the United States, the other advocating a republic one and indivisible with a centralized administration. The Legislative Assembly enacted stringent measures against the émigrés and the priests who refused to take the oath to support the Civil Constitu-

tion of the Clergy. Failing to see that France needed peace in order to complete the solution of her internal questions and to establish a stable form of administration, the Girondists after prolonged discussions secured the passage, on April 20, 1792, of the fatal act declaring war against Prussia and Austria.

Lack of discipline was largely responsible for the failure of the French armies to keep the Austrians and Prussians out of France. The advance of the foreign armies increased the unrest in Paris. Small politicians began to form an organization to use the mob of Paris as a political force. On June 20th they directed a demonstration by the mob, which resulted accidentally in an invasion of the Tuileries. The knell of French monarchy had sounded. King, ministers, and legislators sat helpless awaiting the final blow, while the leaders of the mob quietly but without concealment matured their plans. They usurped the government of Paris, organizing a revolutionary commune. Volunteers were sent to the armies, while others were brought to Paris from Brest and Marseilles, the latter entering Paris singing the patriotic hymn henceforth known as the *Marseillaise*. On July 25th the Duke of Brunswick, who commanded the Austro-Prussian Army which was preparing to invade France, issued a proclamation against the French Revolutionists which aroused the Parisians to frenzy. On August 10th all was ready and the revolutionary leaders struck their blow. The Tuileries was stormed and the Swiss Guard was massacred. The royal family took refuge in the hall of the Legislative Assembly, which suspended the King and placed the royal family under strict surveillance in the Temple. A national convention to revise the Constitution was called, to be elected not on the restricted franchise provided in the Constitution of 1791, but by universal manhood suffrage. Numerous suspects were arrested, and Danton as Minister of Justice acted virtually as dictator. Lafayette in alarm abandoned his army and fled from France, but was seized and imprisoned by the Austrians. Further losses on the frontier resulted in further disturbances in Paris, culminating in the massacres of September, during which about 1000 royalists and non-juring priests in the prisons were slain by the mob. Popular outbreaks also took place in some of the provincial cities. The tide of disaster and disorder was stemmed by the news of the engagement of Valmy on September 20th, between Kellerman and the Duke of Brunswick who vainly cannonaded the French position. On the same day the Legislative Assembly ended its sessions.

The National Convention, composed of about 750 members, nearly 500 of whom were new men, met on September 21st, and promptly showed its character by abolishing the monarchy and declaring France a republic. The first weeks of the Convention were marked by the occupation of Savoy and Nice, the successes of the French armies on the Rhine, and the victory of Dumouriez over the Austrians at Jemappes (November 6). In December the King was brought to trial, and called upon to answer for alleged acts of treason against the nation. Sentence of death was passed upon him, and on January 21, 1793, he was beheaded. The division of parties, which had been noticeable to some extent in the Legislative Assembly, became marked in the Convention. The Girondists

in the beginning possessed a decided majority, but as the party of moderation they showed themselves less able to cope with the many dangers that beset revolutionary France than the thorough-going members of the Mountain. As the representatives, too, of the higher bourgeoisie they were destined to fall before the fierce champions of democracy. The downfall of the Girondist influence began with the trial of Louis XVI., when, against their will, they were compelled to vote to sentence the King to death.

On the frontiers, the year 1793 opened with a series of disasters, which emphasized the folly of the declaration on February 1st of war against Great Britain, the Protestant Netherlands and Spain. Successive defeats were reflected at Paris in successive measures of a vigorous and revolutionary character. Early in March eighty-two members of the Convention were dispatched to the different departments to raise 300,000 troops, and at Paris a Revolutionary Tribunal was established for the speedy trial of persons deemed guilty of crimes against the nation. The defeat of Dumouriez (q.v.) at Neerwinden on March 18th, and the desertion of that general to the Austrians, were followed in April by the establishment of an executive committee of the Convention, the first Committee of Public Safety, which under the leadership of Danton wielded dictatorial powers of government. Civil war was already developing in France because of the resistance of the Catholic and royalist peasants of the Vendée and neighboring departments in Western France to the levy of the 300,000 troops. Up to this time, April, 1793, the Girondists had shared responsibility for every measure of a revolutionary character and had themselves created the instruments of their own overthrow and destruction. But ever since the early weeks of the Convention the Girondists and the Mountain had been engaged in a life and death struggle, whose end was hastened by the terrible dangers which beset France. Hostile armies had crossed the frontier and were pressing toward Paris. Within was civil war. In the words of Danton, audacious measures were necessary. Danton and the Mountain were prepared to take them. The Girondists wanted to debate when delay was treason. The Girondists were overthrown on June 2d, and their leaders expelled from the Convention and placed in custody. The revolutionary commune of Paris, which contained the most radical individuals in power during the Reign of Terror, was placed on a legal footing. In the meanwhile the Deputies on mission were working with patriotic ardor in the provinces, and thirteen armies were organized, equipped, and maintained in the field to serve against foes abroad and at home. A democratic constitution, the Constitution of 1793, was speedily drawn up and promulgated, but it never went into actual force. The Committee of Public Safety ruled France from July, 1793, to July, 1794. In conjunction with the Committee of General Security in charge of the police administration, it saved France, though at the expense of the Reign of Terror.

The Great Committee of Public Safety apportioned its work to the different members. Carnot and Prieur of the Côte d'Or dealt with the questions of military strategy and the supply of arms and ordnance; Lindet and Prieur of the Marne had charge of the provisioning of the

cities and the armies; Jeanbon Saint-André looked after the navy; Billaud-Varenne and Collot d'Herbois were charged with the internal administration and were the real managers of the Terror; Barère and Saint-Just were the spokesmen of the Committee in the Convention; while Robespierre, as the only member with a reputation, did little work, but was a figurehead who received all the glory and later all the blame for the acts of the Committee as a whole. The services of Robespierre, though not very material, were none the less real, because, hiding behind his great personality, the workers were able, unquestioned and unhampered, to save France. The Great Committee carried out the internal administration by sending out members of the Convention as deputies on mission to the different departments to control and direct the revolutionary authorities established in each locality. Bluster, terror, imprisonment, and a few executions kept most of the departments in order. War and measures of a harsher character were employed against the royalist and Catholic uprisings in the Vendée and Brittany, and against the Girondist insurgents in Caen, Lyons, Marseilles, Toulon, and Bordeaux. Popular indignation against the Girondists became more bitter after the assassination of Marat (July 13th) by Charlotte Corday, at the instigation, it was thought, of the Girondists at Caen. By the end of 1793 the Girondist rising had all been suppressed and the leaders, including twenty-one deputies to the Convention, executed. The Vendéans were completely defeated, but continued to carry on a guerrilla warfare until 1800. Nantes, the largest city in the Vendean country, was the headquarters of the infamous deputy on mission Carrier (q.v.), who executed more victims than did his colleagues in all the rest of France. At Paris, Fouquier-Tinville (q.v.) and the Revolutionary Tribunal sent about twenty-six hundred persons to the guillotine, including nearly all of the notable victims of the Revolution from Queen Marie Antoinette down to the unsuccessful generals and the non-juring priests. It is worthy of notice that the number of victims during the Reign of Terror has been greatly overestimated, and that more Frenchmen perished in single battles under Napoleon. The greatest sufferer during the Terror was the Catholic Church, which had to expiate its abuses during the Ancien Régime, and to suffer for its refusal to accept the Civil Constitution of the Clergy. The opposition to the Church culminated in the spasmodic establishment of the Worship of Reason, marked by the Festival in Notre-Dame at Paris on November 10, 1793. Danton and Robespierre recoiled from such desecration, and the Worship of Reason gradually died out. Later Robespierre tried to establish the Worship of the Supreme Being, and inaugurated the new cult by the Festival of the Supreme Being on June 8, 1794. With the introduction of the Revolutionary Calendar in October, 1793, weeks were replaced by decades, and the observance of the Christian Sabbath and of saints' days instead of the *decadi*, and the revolutionary festivals became a criminal offense. These revolutionary festivals were celebrated in Paris with great pageants under the direction of the painter David. The measures of the Government of the Terror were not alone destructive and revolutionary, such as the Law of the Suspects and the Law of the Maximum, establishing fixed prices for commodities and wages, but in-

cluded much of a constructive nature. The bases of the civil and criminal codes were the work of the committees of the Convention. Another committee devised the system of national education, afterwards slightly modified and established by Napoleon. The military committee under Dubois-Crancé effected the reorganization of the army. The metric system and the French decimal currency were among the other creations of the Convention.

The suppression of civil war and the establishment of internal order permitted the use of all the nation's resources against the foreign foe, and a succession of victories planned by Carnot and made possible by the labors of his colleagues soon began to reward the efforts of the Great Committee of Public Safety. Beginning with the successes of Jourdan at Wattignies (October 16, 1793), and of Pichegru at Weissenburg in December, the invaders were driven out of France, and the French armies were able in the spring of 1794 to take the offensive. The series of victories was crowned by Jourdan in the capture of Charleroi and the defeat of the Austrians at Fleurus (June 26, 1794). Thus not only at home, but also against the foreign foe, the Government of the Terror had justified itself.

The Revolution, however, was destined, Saturn-like, to devour its offspring. Robespierre and the Great Committee of Public Safety felt that the circumstances compelled them not only to crush insurrection and revolt, but also to silence any questioning of their policies and acts. On the one hand, Hébert, Chaumette, and the other leaders of the Commune of Paris were more radical than the Great Committee, and incurred the dislike of Robespierre, because of their devotion to the Worship of Reason, and because of the indecent character of the *Père Duchesne*, a series of political tracts published by Hébert. On the other hand, the Great Committee and Robespierre feared Danton, who had begun to suggest that the Terror had gone far enough. Robespierre and the Committee acted with promptness and vigor. The Hébertists were executed on March 24, 1794, and the Dantonists on April 5th. After the death of Danton, Robespierre seemed to be supreme, and at his bidding the Revolutionary Tribunal worked more speedily, and sent daily to the guillotine almost as many victims as it had previously done in a week. The Terror was at its height, but the fullness of time had come. The victory at Fleurus rendered further terroristic measures unnecessary. Furthermore, foes of Robespierre began to see that they stood in the way of the coming of his expected reign of peace and virtue, and so were troubled for their own safety. Among these were even members of the Great Committee, who conceived the idea of making Robespierre the scapegoat for their deeds. The plot was laid, and on July 27th the blow fell. Robespierre and his two friends in the Great Committee, Couthon and Saint-Just, and others of his followers were ordered under arrest and executed on July 28th and the following days. This was the Revolution of the Ninth of Thermidor and the end of the Reign of Terror.

The remaining fifteen months of the Convention were a period of reaction. The Committee of Public Safety, with a changing membership, continued to direct the administration; but the Revolutionary Tribunal was dissolved, the Law of the Maximum was repealed, the deputies ceased to go on mission, and the Jacobin Club,

which had been so closely identified with the Terror, was closed. Girondists and Conservatives who had withdrawn from the Convention or had been expelled were recalled. Until the close of 1794 the Convention and the Committee of Public Safety were controlled by the Thermidorians, the men who had overthrown Robespierre. During the winter of 1794-95 they were superseded by the returning Conservatives and Girondists, who devoted the last months of the Convention to an attempt to obtain revenge for their sufferings during the Terror. On April 1, 1795 (12 Germinal), and on May 20 (1 Prairial) bread riots broke out in Paris and the insurgents clamored for a restoration of the "red republicanism" of 1793. Both insurrections were crushed; the great Terrorists, like Billaud-Varenne and Collot d'Herbois, were deported, and the survivors of the Mountain imprisoned, deported, or executed. This reaction, known as the White Terror, extended to the provinces, especially to Southern France, where the vengeance wreaked upon the Mountain was more bloody than the Terror itself. In the summer of 1795 the Convention performed the task for which it had been elected in the summer of 1792, and drew up a new constitution called the Constitution of the Year III. The closing months of the Convention were marked by an unbroken series of military successes, and by the first efforts toward the restoration of peace. The United Provinces were occupied by Pichegru and organized as the Batavian Republic under French protection; and the French Minister in Switzerland signed at Basel treaties of peace with Tuscany, Prussia (April 5, 1795), Saxony, Hanover, Hesse-Cassel, and Spain (July). France remained at war with Sardinia, England, Austria, and the Empire.

The Convention was not to close without one more insurrection in Paris—that of the 13th Vendémiaire (October 5, 1795), in opposition to the new Constitution. This rising was quelled by Barras with the aid of Napoleon Bonaparte. The Convention came to an end on October 26, 1795, and was replaced by the Directory, the Government established by the Constitution of the Year III. The executive authority was vested in a committee of five Directors, and the legislative power was exercised by two houses, the Council of the Ancients and the Council of Five Hundred. By order of the Convention the first Directors and two-thirds of the first Legislature were to be chosen from the members of the Convention. One member of the Directory and one-third of the Legislature were to retire annually, beginning in May, 1797. The new Constitution had one fatal fault; it made inevitable a deadlock between the Executive and the Legislature, and provided no means of breaking it except by revolution. Such a deadlock occurred after the elections of 1797, and was met by three of the Directors, Barras, Larévellière-Lépeaux and Reubell, who, by the coup d'état of 18 Fructidor (September 4), expelled their colleagues, Carnot and Barthélemy, and a large number of the members of the two Councils, thus preventing the triumph of the party of reaction which had won in the elections. The reverse happened in the coup d'état of 30 Prairial (June 18, 1799), when the Councils asserted themselves and seized control of the Executive, under the leadership of Sieyès. The Directors were assisted in the conduct of the central Government by a Ministry,

which at one time or another included such able men as Talleyrand, Fouché, and Merlin of Douai. The local administration was conducted in an arbitrary manner by national agents appointed by the central Government. The Government was corrupt, and the reckless management of the finances would have ruined the nation had its coffers not been enriched by the plunder of Italy, sent home by Bonaparte. The measures against the émigrés and the non-juring priests lost little of their harshness. Though the worship of Reason had been forgotten, the attempt to give France civil religion continued, and new religions, like 'Theophilanthropy,' were devised and became the fad of the moment. Society, under the influence of the brilliant and dissolute Barras, the most important of the Directors, was corrupt, irreligious, and dissolute. In short, little of importance and nothing of credit marked the internal history of the Directory, and only by the success of its military policy did it justify its existence. In Italy Bonaparte crushed Sardinia and forced her to accept peace, and in a series of campaigns of unsurpassed brilliancy drove the Austrians out of Italy, marched on Vienna, and forced the Emperor, Francis II., to sue for peace, which was concluded at Campo Formio, October 17, 1797. In Southern Germany, Hoche and Moreau had conducted equally glorious but less successful campaigns against the Austrians. Bonaparte refused to invade England, the one remaining enemy of France, and was encouraged by the Directors who feared him in carrying out his scheme of conquering Egypt as a step towards destroying England's power in India. In spite of his victories the campaign was a failure. The English fleet under Nelson destroyed the French fleet in the battle of the Nile (August 1-2, 1798), and held control of the Mediterranean. Meanwhile, freed from the fear of Bonaparte, the enemies of France once more assumed the offensive. Austria broke the Treaty of Campo Formio, and, in alliance with England and Russia, renewed the war. The combined Austrian and Russian armies, by the victories of Suvaroff at the Trebbia (June 17-19, 1799), and at Novi (August 15, 1799), drove the French into Genoa. The reverses of the French arms and the evil internal conditions caused discerning men like Sieyès, Fouché, and Talleyrand to turn to Bonaparte as the possible savior of France. In response to their invitations he returned from Egypt, and by the coup d'état of 18 Brumaire (November 9, 1799) overthrew the Directory and the Councils, and established a Provisional Government, consisting of himself, Sieyès, and Roger Ducos as Consuls. A new constitution, the Constitution of the year VIII., was drawn up, establishing the Consulate, with Bonaparte as First Consul; Cambacérès, Second Consul; and Lebrun, Third Consul. A Tribunal was to debate proposed laws, which were to be voted upon without debate by the Corps Législatif. Practically, the First Consul was dictator, with absolute powers.

PRIMARY AUTHORITIES. The files of newspapers, such as the *Moniteur*; the memoirs of contemporaries, such as those collected by Berville, Barrière, and Lescuré; volumes in the *Collection des documents inédits sur l'histoire de France*, such as Aulard, *Recueil des actes du comité de salut public*; Brette, *Recueil des actes relatifs à la convocation des Etats généraux de 1789*; and

Guillaume, *Procès-verbaux du comité d'instruction publique*; the volumes of the *Collection des documents relatifs à l'histoire de Paris pendant la Révolution française*, such as Aulard, *La société des Jacobins*, the publications of the *Société d'histoire de la Révolution française*, and the *Société d'histoire contemporaine*; the legislative proceedings as given in Buchez and Roux, *Histoire parlementaire*, and Mavidal and Laurent, *Archives parlementaires*; and numerous other publications, such as Kaulek, *Papiers de Barthélemy*, may be mentioned as the most accessible and useful. Special bibliographies on the French Revolution are: Tourneux, *Bibliographie de l'histoire de Paris pendant la Révolution française*, and a portion of the *Catalogue de l'histoire de France à la bibliothèque nationale*. The best short accounts are: Mignet, *Histoire de la Révolution française* (1st ed., Paris, 1824); Rose, *Revolutionary and Napoleonic Era* (New York, 1897); Morse-Stephens, *Europe, 1789-1815* (New York, 1893). The best product of modern scholarship is Aulard, *Histoire politique de la Révolution française, 1789-1804* (Paris, 1901); the best in English, though at present ending at 1793, is Morse-Stephens, *History of the French Revolution* (2 vols., New York, 1886-91). Of the more famous works, Carlyle, *French Revolution* (1st ed. London, 1837), is a literary appreciation; Thiers, *Histoire de la Révolution française* (1st ed. Paris, 1823-27), is now useful only for the Directory; Quinet, *La Révolution* (1st ed. Paris, 1885), and Taine, *La Révolution* (1st ed. Paris, 1878-85), are philosophical and psychological rather than historical studies; Michelet, *Histoire de la Révolution française* (1st ed. Paris, 1847-53), is the most brilliant literary history in French. There are English translations of Mignet, Thiers, Michelet and Taine. Though differing widely in method, bias, and value, the most useful special works are, for international relations: Sybel, *Geschichte der Revolutionszeit von 1789 bis 1800* (5 vols., Düsseldorf, 1853-74; English translation to 1795, London, 1867-69); Bourgoing, *Histoire diplomatique de l'Europe pendant la Révolution française* (3 vols., Paris, 1865-71); Sorel, *L'Europe et la Révolution française* (4 vols., Paris, 1885-92); for military affairs: Jomini, *Histoire critique et militaire des campagnes de la Révolution de 1792 à 1801* (3d ed., 15 vols., and 4 atlases, Paris, 1819-24); Chuquet, *Les guerres de la Révolution* (11 vols., Paris, 1886-1895); Jung, *L'Armée et la Révolution: Dubois-Crancé* (2 vols., Paris, 1884), and *Bonaparte et son temps, 1769-1799* (3 vols., Paris, 1880-85); for naval affairs: Mahan, *Influence of Sea Power upon the French Revolution and Empire, 1793-1812* (2 vols., Boston, 1892); Chevalier, *Histoire de la marine française sous la première république* (Paris, 1896); for the Emigrés: Forneron, *Histoire générale des émigrés pendant la Révolution française* (3d ed., 2 vols., Paris, 1884); for internal affairs: Aulard, *L'éloquence parlementaire pendant la Révolution française* (3 vols., Paris, 1882-86); Mortimer-Ternaux, *Histoire de la Terreur* (8 vols., Paris, 1862-81); Wallon, *Histoire du tribunal révolutionnaire de Paris* (6 vols., Paris, 1880-82), *La Révolution du 31 mai et le fédéralisme en 1793* (2 vols., Paris, 1886), and *Les représentants du peuple en mission et la justice révolutionnaire dans les départements en l'an 2* (5 vols., Paris, 1889-90); Sciout, *Le*

Directoire (2 vols., Paris, 1895, in publication); for the finances: Stourm, *Les finances de l'ancien régime et la révolution* (2 vols., Paris, 1885); for religious affairs: Sciout, *Histoire de la constitution civile du clergé* (4 vols., Paris, 1872-81); Aulard, *Le culte de la raison et le culte de l'Être suprême* (Paris, 1892); for society: Goncourt, *Histoire de la société française pendant la Révolution* (Paris, 1854), and *Histoire de la société française pendant le Directoire* (Paris, 1855); for the Vendean War: Chassin, *La préparation de la guerre de Vendée* (3 vols., Paris, 1892), *La Vendée patriote* (4 vols., Paris, 1893-95), and *Les pacifications de l'Ouest* (3 vols., Paris, 1898-99).

FRENCH RIVER. A stream in Ontario, Can., emptying Lake Nipissing into the Georgian Bay of Lake Huron, after a course of 55 miles (Map: Ontario, C 2). It is noted for its magnificent scenery, and for 150 years was the regular route to the Upper Lakes.

FRENCH RYE GRASS. See *ARRHENATHE-RUM*.

FRENCH SETTLEMENTS. The French colonies of Pondicherry, Chandernagar, Karikal, and Mahé (q.q.v.) in India.

FRENCH SHORE. See *NEWFOUNDLAND*.

FRENCH SOMALILAND, sô-mä'lê-länd. A possession of France in Northeast Africa, on the west shore of the Gulf of Aden; bounded on the northwest by Eritrea, on the west and southwest by Abyssinia, and on the southeast by the British Somaliland Protectorate (Map: Africa, J 3). The area of the French Somali Protectorate proper is almost 5000 square miles; with the dependencies, the area is estimated at 45,000 square miles. The coast is generally hilly. The interior is practically a plateau, with an average elevation of about 4000 feet, and sloping from northwest to southeast. Almost without industries of any kind, the country has, however, a trade of some importance, owing to the sea fisheries and the traffic with the interior of the continent. In 1900 the imports reached a value of \$1,200,000, an increase of \$400,000 over 1899. The value of the exports is given at \$450,000 in 1899 and \$140,000 in 1900. Among the imports are cotton and silk goods, foodstuffs, and tobacco; among the exports are coffee, ivory, gold, and sheepskins. Most of the direct trade is with France. The Jibuti-Harar Railway has 100 miles open for traffic, and will bring a greatly increased trade from Abyssinia. The ports are in close communication with Aden by local boats. French and English vessels visit the coast regularly.

The country is, since 1899, administered by a Governor and by a General Council of six members, three chosen from Government officials, and three from the leading residents. In 1902 the French budget for the Somali coast was \$40,000. In 1900 the local budget was \$120,000. The population of the protectorate proper is about 22,000; with the dependencies added the population is estimated at 200,000. The natives belong to the Danakil and Galla races. The principal towns are Jibuti, a port since 1888, and now the seat of the colonial administration; Obok, with 15,000 inhabitants (2500 European), a port with post-office and telegraph; Tajurah, with 2000 people; and Ambado, Gobad, and Sagallo. Obok has been in possession of the French since 1855. In 1881

they began active operations in this region. They acquired Sagallo in 1883; Tajurah in 1884; and Ambado in 1888, in which year a port was created at Jibuti. In 1887 and 1891 the boundaries of the country were definitely fixed with England and with Italy, and in 1896 with Abyssinia on the west.

FRENCH SPOILIATION CLAIMS. Demands made upon the United States Government by American merchants for losses of ships and cargoes between 1793 and 1800 at the hands of the French, whose chief excuse for the depredations was that the United States had violated its pledges under the treaty of 1778. By the treaty of September 30, 1800, and by the convention of April 30, 1803, France released the United States from certain treaty obligations, and in return was released from paying the merchants' claims, the United States securing peace at the expense of her citizens. Between 1800 and 1885 some fifty bills to reimburse the claimants or their descendants came before Congress, and appropriations were twice voted, but were vetoed in each case by Presidents Polk and Pierce respectively. No redress was obtained until 1885, when the adjudication of the claims was given to the Court of Claims, and decisions were reached awarding some \$4,800,000 to the petitioners.

FRENCH SUDAN, sōō'dīn'. A name formerly used to designate the territory in Western Africa extending from about 12° W. longitude to Lake Chad, and from the Sahara on the north to the northern boundaries of the countries along the northern coast of the Gulf of Guinea (Map: Africa, D 3). French Sudan was divided up by a decree in 1899. The western portions of it fell to Senegal, French Guinea, the Ivory Coast, and Dahomey, and the rest was formed into the three military territories of French Sudan, all the foregoing possessions being under the administration of the Governor-General of French West Africa (q.v.).

FRENCHTOWN. A township in Monroe County, Mich., about 22 miles southwest of Detroit, formerly the name of a village on the site of the present Monroe. Here on January 14, 1813, during the second war between the United States and Great Britain, an American force of about 650, under Colonel Lewis, defeated a force of about 100 British, under Major Reynolds, and of about 400 Indians, under Round-Head and Walk-in-the-Water, the American loss being 12 killed and 55 wounded, and the British and Indian loss, though not definitely known, probably being considerably larger. On the 20th Colonel Lewis was joined by General Winchester with about 250 men, and on the 22d the combined force was defeated by a force of about 500 British, under Colonel Proctor, and about 600 Indians, under Round-Head and Walk-in-the-Water. In accordance with the orders of General Winchester, who had been captured by the Indians, Major Madison surrendered his troops as prisoners of war, on condition that protection be afforded by Proctor against the Indians. The prisoners who were able to march were taken by Proctor to Malden, Canada, and the wounded were left in the charge of an insufficient guard commanded by Major Reynolds at Frenchtown. On the 23d the wounded were massacred by the Indians, in what is known as the 'Massacre of the River Raisin.' Of the total American force 397 were killed or were missing, 537 were captured,

and only 33 escaped. The British lost about 24 killed and 158 wounded; while the Indian loss, though doubtless very large, was never accurately determined. Throughout the rest of the war 'Remember the River Raisin' was used as a battle-cry by the frontiersmen. Consult Dawson, *Battles of the United States* (New York, 1858).

FRENCH VERSION. See BIBLE.

FRENCH WEST AFRICA. A governor-generalship of France, comprising, in accordance with the decree of October 17, 1899, practically all of the Sahara; Senegal, including the western part of what had been known as French Sudan, which part was annexed to Senegal in 1899; the three military territories of French Sudan; and French Guinea, the Ivory Coast, and South Dahomey (Map: Africa, D 3). The Governor-General of French West Africa resides at Saint-Louis, Senegal, and besides exercising general authority over all the above-mentioned French possessions, acts as Governor of Senegal.

FREND, WILLIAM (1757-1841). An English reformer. He was born at Canterbury; was educated at Saint-Omer, France, and, after a few weeks spent in business in Quebec, went to Christ's College, Cambridge, where he studied for orders and took high honors. In 1781 he was chosen fellow. Two years afterwards he was appointed rector at Madingley, near Cambridge. In 1787 he became a Unitarian; tried to convert the surrounding country by an *Address to the Inhabitants of Cambridge . . . to turn from the false Worship of Three Persons to the Worship of the One True God* (1788), and did his best to do away with obligatory subscription to the Thirty-Nine Articles as a preliminary to the master's degree. For this heresy he was removed from his office of tutor. Five years later, after travels abroad, he wrote a radical pamphlet, *Peace and Union Recommended to the Associated Bodies of Republicans and Anti-Republicans*. The vice-chancellor and heads of the colleges tried him and found him guilty of breaking the statute *De Concionibus*. He was banished from the university, but continued to hold his fellowship until he was married (1808). In 1806 he went to London and was long connected with the Rock Life Assurance Company. He wrote *Principles of Algebra* (1796-99). His pamphlets, besides those mentioned above, were: *Thoughts on Religious Tests* (1789); *An Account of the Proceedings in the University of Cambridge Against William Frend* (1793); *Scarcity of Bread* (1795); *A Letter to the Vice-Chancellor of Cambridge* (1798); *Principles of Taxation* (1799); *The Effect of Paper Money on the Price of Provisions* (1801); *A Letter on the Slave Trade* (1817).

FRENEAU, fre-nô', PHILIP (1752-1832). An American poet, a graduate of Princeton (1771), where he was a college mate of James Madison and H. H. Brackenridge (q.v.). He wrote with the latter for the college commencement a poem on "The Rising Glory of America." He had begun writing verses early, and did much ephemeral work immediately after graduating. After teaching school for a time he studied law and made his first essay in journalism in Philadelphia. In 1776 he made a voyage to the Danish West-Indies, serving as mate and acquiring nautical experience. On his return to the United States he did some editing with Brackenridge, then took out

letters of marque and made a voyage in a privateer which he had built (1780). He was captured by the English, and recorded his experiences on a prison ship at New York in a prose narrative and in a strong poem in four cantos, "The British Prison Ship." He regained his liberty in July, 1780, wrote much in prose and satiric verse in periodicals, collected his poems (1786), and occupied himself as shipmaster and journalist till 1791, when Jefferson made him translator for the State Department, and induced him to take charge of the violently anti-Federalist *National Gazette*. Two years later Freneau retired to his home at Mount Pleasant, N. J., and edited the *Jersey Chronicle* for a year. Then he tried journalism in New York, but soon abandoned it for the sea. He made several voyages, one as far as Calcutta, but retired in 1809 in consequence of the laws restricting navigation. After this his life was uneventful. When nearly eighty-one he was found dead in a marsh, having lost his way in the snow while returning home from an entertainment. Editions of Freneau's poems (which are hard to obtain) were published during his life in 1786, 1788 (containing some prose), 1795, 1809, and 1815. The last was filled with panegyrics on the soldiers and sailors of the War of 1812. The edition of 1786 was reprinted in London and New York, 1861 and 1865. Freneau was the first genuine American poet of marked ability. Though his poetry is largely satirical, the most permanent is found in the beautiful lyrics, such as "The Indian Burying-Ground," "The Wild Honeysuckle," and "Eutaw Springs." His verses show a distinct love of nature, and prove him to have been a man of considerable culture, although in the main they follow conventional eighteenth-century models. He published a few volumes of prose under the pen-name of "Robert Slender," which have received and deserve little attention. Consult: The biography by Mary Austin (New York, 1901); Tyler, *Literary History of the American Revolution* (New York, 1897); and Wendell, *Literary History of America* (New York, 1900). A complete edition of Freneau's poems is being prepared by F. L. Pattee (1902).

FRENTANI. A people in Central Italy in the early ages, descended from the Samnites, but allies of Rome. They dwelt in a hilly region on the shores of the Adriatic Sea, and their chief town was Histonium.

FRENZEL, frén's'el. KARL WILHELM (1827—). A German journalist and novelist, born and educated in Berlin. In 1861 he became associated with the *National-Zeitung* of Berlin in the capacity of dramatic and literary critic. His works include many historical novels depicting French life during the eighteenth century. Several of these are well known, such as *Charlotte Corday* (1864); *Watteau* (1864); *La Pucelle* (1871); and *Lucifer, ein Roman aus der Napoleonischen Zeit* (1873). His *Berliner Dramaturgie* (reprinted 1882) is a valuable and interesting contribution to the history of the modern drama at the German capital.

FREPPÉ, fré-pèl'. CHARLES EMILE (1827-91). A French prelate and ecclesiastical historian. He was born at Obernai, Lower Alsace, and studied at the Theological Seminary, Strassburg, and was ordained in 1849. In 1854 he was appointed professor of church oratory at the University of Paris, in 1862 he became preacher

at the Tuileries, and in 1870 he was appointed Bishop of Angers. He was a champion of the doctrine of the infallibility of the Pope, which doctrine he defended before the Ecumenical Council at the Vatican. After the Franco-German War he publicly counseled the restoration of the monarchy, and on numerous occasions, more particularly during the controversy between Bismarck and the Vatican, he revealed his anti-German tendencies. The Catholic University at Angers was founded by him in 1875. Several of his numerous works on Church history and kindred subjects have become extremely popular. These include: *Les pires apostoliques et leur époque* (3d ed. 1870); *Les apologistes chrétiens au IIe siècle* (3d ed. 1886); *Examen critique de la vie de Jésus-Christ par M. Renan* (15th ed. 1866), a violent polemic directed against the well-known work by Renan. His complete works were published in 10 volumes (1880-88).

FRÈRE, frar. A family of French painters. **CHARLES THÉODORE** (1815-88), the elder, genre and landscape painter, was born in Paris. He was a pupil of Cogniet and Roquelin, and made his first exhibit in 1834. Two years later he went to Algeria, traversed the desert, visited the East, and was present at the fall of Constantine, in October, 1837. In 1869 he accompanied the Empress Eugénie in her voyage up the Nile, making a sketch-book of aquarelles at her request. His favorite subjects for pictures were scenes from Eastern life, but he occasionally produced military pieces. Small in size, his paintings are rich in color, accurate in design, and harmonious in execution. Among the best of them are a series of scenes in Constantine (1840-48), a "Bazaar in Damascus," a "Harem in Cairo," "Festival in Constantinople," "Ruins of Karnak," "Caravan of Mecca." He twice received the medal—in 1848 and in 1865. He died in Paris, March 25, 1888.—**PIERRE EDOUARD** (1819-86). A genre painter, brother of the preceding. He was born in Paris, January 10, 1819, and studied under Paul Delaroche and in the Ecole des Beaux-Arts. He exhibited his first picture in the Salon of 1843, and received two third-class medals—in 1850 and 1855—and a second-class medal in 1852. At the close of the Exposition of 1855 he was decorated with the cross of the Legion of Honor. He was one of the most sane and wholesome of French genre painters, and his portrayal of humble household scenes and child life are marked by true sentiment. He possessed also a fine sense of color. His pictures are well known through reproductions. Among the best are the "Little Gourmand," "Curiosity," "Repose," "The Little Cook," "First Steps," "The Library," "Going to School." Frère died at Anvers-sur-Oise, June, 1886.—**CHARLES EDOUARD** (1837—). A genre, landscape, and portrait painter, son and pupil of Théodore. He received a second-class medal in 1848, and a first-class medal in 1865. Among his paintings are the "Muleteer in the Alps" (1865), "The Basket-Sellers," "Before the Rain" (1875), "The Surgical Operation" (1884).

FRÈRE, frêr, Sir HENRY BARTLE EDWARD, familiarly known as Sir BARTLE FRÈRE (1815-84). A British diplomat and administrator. He was born at Clydach, Brecknockshire, March 29, 1815, and after education at Bath Grammar School went to Haileybury College to prepare for the Indian Civil Service, which he entered in 1834, and in

1835 received an appointment at Poona. His judicious treatment of native agriculturists led to beneficial results and to his advancement. In 1842 he became secretary to Sir George Arthur, Governor of Bombay; in 1856 proceeded to Sindh as British resident; and in 1860 was appointed chief commissioner. In 1859 he was created K.C.B. in recognition of valuable services during the Indian mutiny, for which he twice received the thanks of Parliament. From 1862-67 he was Governor of Bombay. On his return to England he was knighted and nominated member of the Indian Council in London. In 1872 he went as special commissioner to East Africa, and induced the Sultan of Zanzibar to sign a treaty abolishing the slave trade. In 1875 he was chosen to accompany the Prince of Wales to Egypt and India. He was Governor of Cape Colony 1877-80, and as High Commissioner for British South Africa was deputed to arrange the confederation of the South African colonies, which was frustrated by the Kaffir and Zulu wars and trouble with the Boers. He was recalled and lived in retirement at Wimbledon until his death, March 29, 1884. He was several times president of the Royal Asiatic Society, and in 1872 was elected president of the Royal Geographical Society. His writings, consisting of letters, speeches, etc., include a *Memoir of the Right Hon. John Hookham Frere*, prefixed to the latter's works (1871-74); *Pandurang Hari, or Memoir of a Hindoo*; and *Eastern Africa as a Field for Christian Labor* (1874). Consult Martineau, *Life and Correspondence of Sir Bartle Frere* (London, 1895).

FRÈRE, JOHN HOOKHAM (1769-1846). An English diplomat and author. He was born in London, and in 1785 went from a Putney preparatory school to Eton. He proceeded to Caius College, Cambridge; graduated B.A., 1792; M.A. in 1795, and was elected a fellow. He entered the Foreign Office under Lord Grenville and from 1796-1802 represented Looe, Cornwall, in Parliament. As a contributor to the *Anti-Jacobin* he supported Canning's defense of Pitt's Administration, and in 1799 was made Under-Secretary of State. He was appointed Envoy to Lisbon in 1800, and twice went as Minister to Spain in 1802 and 1808. His counsel, resulting in Sir John Moore's disastrous retreat to Corunna, caused his recall. He afterwards refused an ambassadorship at Saint Petersburg, and twice declined a peerage. Owing to his wife's ill health, he retired to Malta, and devoted himself to literature and languages. His mock-heroic poem, *Prospectus and Specimen of an intended National Work by William and Robert Whistlecraft, of Stow-Market in Suffolk, Harness and Collar makers, intended to comprise the most interesting particulars relating to King Arthur and His Round Table* (1817), furnished the model for Byron's *Beppo* and *Don Juan*. Frere's fame rests on his admirable translations of Aristophanes, *The Acharnians*, *The Knights*, *The Birds*, and *The Frogs*, which were privately printed, and only made public in 1847 by Sir G. Cornwall Lewis in *The Classical Museum*. Consult *Memoir and Works of the Right Hon. John Hookham Frere*, by his nephews, W. E. and Sir Bartle Frere (London, 1874).

FRÈRE-ORBAN, frar' or'bän', HUBERT JOSEPH WALTHER (1812-96). A Belgian statesman. He was born at Liège, received his education at home and in Paris, and began the practice

of law in his native town. He identified himself with the Liberal Party, and was conspicuous in the controversy with the Catholic clergy. In 1847 he was elected to the Belgian Chamber, and appointed Minister of Public Works, and from 1848 till 1852 he held the portfolio of finance. His work, *La main morte et la charité*, directed against the Conservatives, produced a great effect on the position of parties in Belgium. In 1857 the Liberals returned to power and Frère-Orban became once more Minister of Finance in the Cabinet of Rogier. In 1870 the Catholics regained their supremacy and forced him to retire, but from 1878 to 1884 he was again at the head of the Cabinet. Subsequently he led the opposition in Parliament till 1894, when he lost his seat. He was a successful financier and a believer in the doctrine of free trade. His liberalism consisted in the assertion of the authority of the State over the Church and the defense of the system of secular public instruction against the clergy. He was at all times opposed to the undue extension of the suffrage.

FRERICH'S, frä'riks, FRIEDRICH THEODOR VON (1819-85). A German physician, born at Aurich, and educated at Göttingen and Berlin. After holding a professorship at Kiel and conducting the clinical institute and hospital in that city, he was for eight years professor of pathology and therapy at Breslau (1851-59), whence he was called to Berlin in 1859, where he became permanently established. He was considered one of the leading medical authorities in the German capital, and as physician on the general medical staff of the Prussian Army, rendered particularly valuable services during the Franco-German War. His principal work is the *Klinik der Leberkrankheiten* (2d ed. 1861; English translation, 1860, under the title *A Clinical Treatise on the Diseases of the Liver*; also translated into French and Italian).

FRÉRON, frä'rön', ELIE CATHERINE (1719-76). A French critic and controversialist, noted as the chief opponent of Voltaire. He was born at Quimper. A brilliant pupil of the Jesuits, he was made professor at the Collège Louis-le-Grand at the age of twenty, and on leaving the Jesuits (1739) was engaged for thirty-five years as contributor to literary journals, in which he carried on a relentless war with Voltaire in particular and against the encyclopædic movement in general. His work is not without cleverness and good literary judgment, but is best remembered for the retorts it evoked from Voltaire, notably *Le pauvre diable*, *L'Ecossoise*, and *L'âne littéraire* (The Literary Donkey), the title of which parodied that of Fréron's journal *L'Année Littéraire* (1754-76). Fréron wrote also histories of *Mary Stuart* (1742), and of *Germany* (1771), as well as negligible verses. He died in Paris, March 10, 1776. Consult: Nisard, *Les ennemis de Voltaire* (Paris, 1853), and Monselet, *Fréron* (Paris, 1864).

FRÉRON, LOUIS STANISLAS (1765-1802). A French journalist and legislator, son of the preceding, born in Paris. He was educated at the Collège Louis-le-Grand, and first came prominently before the public as editor of the *Année Littéraire*. In 1790 he founded the revolutionary journal *L'Orateur du Peuple*. He was elected a deputy to the convention in 1792, was follower of Danton, and after perse-

cutting the Royalists with great cruelty, contributed to the downfall of Robespierre and attacked the Terrorists, finally entering into negotiations with the Monarchist faction. He was appointed subprefect of Haiti by Napoleon in 1802, where he died soon afterwards from the effects of the climate. His *Mémoire historique sur la réaction royale et sur les massacres du Midi* (1796) contains a defense of his conduct at Toulon in 1793, as commissioner of the Army of Italy.

FRESCO (It., cool, fresh), or **FRESCO-PAINTING**. The term properly applied to painting executed upon plaster while it is still wet or fresh: hence the Italian name *al fresco*. It is also improperly used for all painting executed directly on the surface of a wall by whatever process, even in encaustic (q.v.), the process of burning in with the use of wax, or in *tempera* (q.v.), also called *distemper*, which is the process where water-colors mixed with egg or some glutinous substance are used. The method of true fresco-painting is as follows: A wall, either of brick or stone (better than laths) and perfectly dry, is plastered with lime and water (hydrate of lime), which has been prepared and allowed to stand for at least a year. Before using it is mixed with sand and while the water is in process of being expelled by the carbonic acid in the lime, the pigments must be applied in order that the protective covering of carbonate of lime may form over them. The first and coarser coats, called *arriccio*, may be applied over the entire wall about half an inch thick and with a roughened surface; the two finer finishing coats, called *intonaco*, are applied only on whatever portion of the surface can be painted in a day. This surface is then covered by the corresponding portion of the artist's cartoon, of the same size as the finished fresco is to be. This cartoon is executed usually in black and white and quite sketchily, though the artist often has for further assistance a smaller sized colored sketch for use in the details and color scheme. The impression of the cartoon is left on the plaster either by pouncing or by indenting the outlines with a pointed implement of wood or bone, and the cartoon being then removed, the painter proceeds to apply the colors; these are mostly earths or minerals, as few others will stand the action of lime, and they are ground and applied with pure water. The coloring is necessarily thin, transparent and light, though since the late Renaissance the more liberal use of *impasto* has lessened these qualities, giving greater opacity. When the day's work is finished the artist cuts away any of the plaster that he has not painted on, beveling it at the very edge of his finished work, and the next day the plasterer joins closely another portion of plaster to the edge of the portion painted on the previous day. The lime, in drying, throws out a kind of crystal surface, which protects the color, and imparts a degree of clearness much superior to, and easily distinguishable from, that of a work in *tempera* or size paint. This process, although apparently simple, nevertheless requires great dexterity and certainty of hand; for the surface of the plaster is delicate, and must not be overworked; besides, the lime only imbibes a certain quantity of additional moisture in the form of liquid colors, after which it loses its crystallizing quality, and the surface, or a portion of it, becomes what painters call rotten.

Many frescoes are defective in this way. It is only after the lime has dried that such flaws are discovered; the proper plan in such a case is to cut away the defective portion, have fresh plaster laid on, and do the work over again. But the flaws are too often retouched with *tempera* or size colors; and though they may escape notice for a time, the parts touched will change or come off in the course of a few years. All retouching must, of course, be done *a secco* on the dry plaster and must be sparingly used. Another difficulty in fresco is that the colors become much lighter after the plaster dries, and for this allowance must be made. However, by practice, the painter may soon get over this difficulty; and he can test the difference between the color as wet and as dry, by putting a touch on a piece of umber he has generally at hand, which instantly dries the color, and shows it as it will be when the lime has dried. *Fresco secco* is a spurious kind of fresco, ordinarily used only in house decorations. The colors are the same, but they are laid on after the plaster is dry. Before the work begins the dry plaster is rubbed with pumice-stone to remove the crust, and then washed with water mixed with a little lime. The effect is coarse, dry, and common, and the thin protecting crust is inadequate to preserve the painting.

The preëminence claimed for fresco-painting is founded on: (1) Clearness and purity of color; (2) a dead surface as far removed from the dullness of *tempera* as from the gloss of oils and so capable of being viewed from all points; (3) durability under all conditions; (4) cheapness of process; (5) necessity for quick work, precluding the frittering of artistic energy on unessentials. On the other hand, it labors under the disadvantage of the fragility of the plaster, the liability to whitewash, the lack of depth and richness, and the necessity of more or less retouching by another process (*a secco*).

FRESCOBALDI, frès'kô-bâl'dè, GIROLAMO (1583-1644). A celebrated Italian organist and composer, born at Ferrara. Very little of his earlier life and training is known, although he had published a collection of five-part madrigals as early as 1608. He appears to have studied with Luzzaschi in his native place, afterwards taking up his residence in Belgium. Returning to Italy he lived first in Milan, and in 1627 in Rome, where three years later he obtained the position of organist at Saint Peter's. By this time he had acquired wide fame as an organ virtuoso, as many as 30,000 people, it is recorded, having gone to hear his first performance at Saint Peter's. With the exception of one short interval (1628-33), during which period he held the appointment of Court organist at Florence, he retained his position at Rome. He is regarded by many historians and musical authorities as the greatest organist of the first half of the seventeenth century, while as a composer he is scarcely less famous. In the latter capacity he is credited with anticipating the modern key system, and the introduction of advanced ideas in fugal form and musical notation. Frescobaldi's music is the highest type of early seventeenth-century music, and displays the consummate art of the Early Italian School. His vocal compositions include canzones, motets, hymns, and the collection of madrigals already noted. He died in Rome.

FRESenius, frē-zā'nē-us, KARL REMIGIUS (1818-97). An eminent German analytical chemist. He studied at Bonn and at Giessen, and was assistant to Liebig. In 1845 he became professor of chemistry and allied sciences at the Agricultural Institute of Wiesbaden. Fresenius carried out numerous important investigations in analytical chemistry, and did much toward systematizing this art by the publication of excellent works. His exhaustive standard treatises, well known to every student of chemistry, have passed through many editions in German, and have been translated into several languages. They include: *Anleitung zur qualitativen chemischen Analyse*, first published in 1841, and *Anleitung zur quantitativen chemischen Analyse* (1845). In 1862 he founded the *Zeitschrift für analytische Chemie*. See ANALYSIS, CHEMICAL.

FRESH-AIR WORK. A form of charity which consists in taking poor children from the slums of great cities into the country or to the seashore for recreation. The first authenticated case of charity of this kind was in 1849, when Rev. William A. Muhlenburg, a pastor in New York City, sent poor and sick people from his parish into the country for short vacations. In 1872 the *New York Times* inaugurated a system of free excursions, and its example was followed in other parts of the country. The first general fresh-air societies were organized in 1874. Since that time, by reason of the earnest support of philanthropists and of such newspapers as the *New York Evening Post* and *Tribune*, the number of such societies has greatly increased. The general agencies in thirty-eight cities furnish as many as a million days' outing to the poor and destitute, while sectarian and private organizations add greatly to this number. In New York City alone, fourteen general and non-sectarian organizations, and no fewer than nineteen denominational and special societies, are in the field. The beneficiaries are, for the most part, children from six to twelve years old, though some of them are infants. A few adult women usually accompany them. They are sent away from the city for periods varying from a few hours to a fortnight spent in the so-called country 'homes,' or as the guests or boarders of private families. As a rule, the parents of the children are not required to bear any of the cost. In London, on the other hand, parents often pay as much as a third or more of the expenses. Some confusion, however, results from this practice. Different fresh-air societies compete with each other, diminishing the contribution which the parent is required to make, thus making impossible the benefits which would result from coöperation.

On the Continent of Europe, Switzerland was the first country to develop this form of charity. The Rev. W. Bion, of Zurich, established the first of the Vacation Colonies in 1876. Provision had been made for poor children previously, but it was not until that year that the work was systematized and brought into close relation with the public schools. In 1895 Switzerland had seventy-three of these colonies, to which 2,119 children were sent in that year. The colonies are usually situated in the mountains. Comfortable lodgings and wholesome food are furnished free of charge. Part of the expense is borne by the State and by municipal governments. The organization of fresh-air charity in Germany was contempora-

neous with its organization in Switzerland. The first children's sanatoriums were organized in Kolberg and Rothenfelde in 1874. Two years later the first children were sent to vacation colonies, and during the twenty years following 300,000 children were cared for at an expense of 15,000,000 marks. In addition, large numbers of children are given excursions lasting a day. Those who are sent to a distance, to seaside or health resorts, are usually accompanied by a teacher. One hundred and twenty-five cities had established colonies before 1896, and were sending 30,000 children to them yearly. It is also common in Germany and Denmark for the artisan classes in the city and country to make a temporary exchange of children during a part of the summer. In France, fresh-air charities are less developed than in any other important European country, but they are gradually rising in importance. Paris sent 4254 children to the country and seashore in 1897. Lyons, Bordeaux, Lille, Toulouse, Nancy, Besançon, and other cities have established colonies. The system of placing children in private families to board is preferred to that of sending them to 'homes' or sanatoriums in the country, but the German plan of exchanging city and country children is found unsatisfactory. The vacations are long. The child is often left in the country for a little more than a month, at a cost of about 20 francs.

Vacation colonies have also been established in Spain, Italy, Austria-Hungary, Belgium, Russia, and in Argentina. The system in Europe is superior to the system in the United States in two respects—there is marked coöperation of fresh-air agencies in Europe by means of conferences and exchange of reports; and the work is closely affiliated with the public schools. Consult: U'ford, *Fresh Air Charity in the United States* (New York, 1897); Germain, "Vacation Colonies in Switzerland," *Consular Reports*, vol. lii., No. 193; Comte, "Les colonies de vacances," *Revue philanthropique* (Paris, 1898).

FRESH-WATER MARSH-HEN. See RAIL.

FRESH-WATER MUSSEL. Any of the great many species of Unio or Anodon—bivalve or pelecypod mollusks of rivers and ponds, especially abundant in North America. See MUSSEL.

FRESNEL, frā'nēl', AUGUSTIN JEAN (1788-1827). A French physicist. He was born at Broglie, and was educated at Caen at the Ecole Polytechnique, and at the Ecole des Ponts et Chaussées. On the completion of his studies he was sent as Government engineer to the Department of Vendée, and afterwards to the Department of Drôme, where he remained till 1814. He lost his position on the return of Napoleon from Elba, because he, as a Royalist, had offered his services to the Bourbons. After the Second Restoration he returned to Paris, where he resumed his duties as Government engineer. In the interval he devoted his enforced leisure with great success to physico-mathematical researches, investigating in particular the polarization of light. In ignorance of the work of Young, Fresnel demonstrated to his countrymen the error of the Newtonian theory of the propagation of light (q.v.) by the emission of material particles, and so ably advocated the undulatory hypothesis that Arago, who was a member of a commission appointed to consider the paper containing the new theory, became.

an enthusiastic convert to his ideas. Fresnel's crowning experiment, which demonstrated the truth of the theory, was with the two mirrors inclined at an angle of nearly 180°, so that the incident beams were reflected to the same point, and alternate light and dark bands or fringes were seen. This was not caused by diffraction, as the beams were reflected from the surface of the mirrors. With Arago he investigated the action of polarized light, and their discoveries, published in a joint memoir, confirmed the new theory of the mode of the propagation of light. His practical application of scientific optics to the improvement of the lighthouse system was of incalculable value, and he served for several years as a member of the lighthouse commission. See LIGHTHOUSE.

FRESNILLO, frēs-n'lyō. A town in the State of Zacatecas, Mexico, 36 miles by rail northwest of the city of Zacatecas; on the Mexican Central Railway (Map: Mexico, H 6). It is situated at an elevation of nearly 6900 feet, and is well built and laid out with broad, straight streets. Stock-raising is carried on in this region, but the town derives its chief importance from the rich silver and copper mines of the Cerro del Proaño, discovered in 1554. There are other mineral deposits. Population, in 1895, 6757.

FRESNO. A city and the county-seat of Fresno County, Cal., 207 miles southeast of San Francisco; on the Southern Pacific and the Atchison, Topeka and Santa Fé railroads (Map: California, D 3). It has a public library building (\$30,000), the gift of Andrew Carnegie, and \$100,000 has been appropriated by Congress for a United States Government building. The city is the centre of an agricultural and stock-raising district, has important petroleum interests, and extensively exports raisins, the annual production of which is valued at \$3,000,000, wines and brandies, grapes, oranges, olives, and other fruits, besides wheat, sheep, and horses. Under a charter of 1901 the government is vested in a mayor, elected every four years, a municipal council, and administrative officials, all of whom are appointed by the mayor with the consent of the council, excepting the city clerk, police judge, and school directors, chosen by popular vote. Settled in 1872, Fresno became the county-seat in 1874, and was chartered as a city in 1885. Population, in 1890, 10,818; in 1900, 12,470.

FRESTON. An enchanter in the Spanish romance *Belianis of Greece*. Don Quixote accuses him of stealing his library and changing the giants into windmills.

FRET (probably from OF. *frete*, iron band, ferrule, syncopated from It., ML. *ferrata*, iron grating, from *ferrare*, to bind with iron, from Lat. *ferrum*, iron). A charge in heraldry (q.v.).

FRÉTEAU DE SAINT JUST, frā'tō' de sän zhüst'. EMMANUEL MARIE MICHEL PHILIPPE (1745-94). A French politician and magistrate. In 1787 he was imprisoned in the Castle of Doullens for his opposition to the King, but returned to his seat in Parliament a year later. He was elected a Deputy to the States General, and was one of the first of his rank to join the Third Estate. He became a member of the Constitutional Committee, then secretary and twice president of the Assembly. In 1790 he introduced a resolution that only the Assembly, acting on the

King's initiative, had the right to make war; demanded that the title of Archbishop should be done away with, and also voted for the suppression of all titles of nobility; and near the end of the year was elected judge in Paris. In 1792 he resigned from the presidency of the First Arrondissement, and retired to his home at Vaux-le-Pénil. Two years afterwards he was arrested on the charge of joining two priests in an attempt to incite insurrection. He was acquitted, but was kept in prison, and two months later was tried and executed for favoring the schemes of Capet, and for complicity with Thouret and Le Chapelier.

FRETS. Pieces of wood or metal placed transversely on the finger-boards of some of those stringed instruments that are plucked by the finger, or played with a plectrum, to mark off the intervals. In the Middle Ages instruments played with the bow had frets, such as the rebec and the viola de gamba. Frets were used by the Chinese, East Indians, Egyptians, and probably were introduced into Europe by the Arabians. They are still used on the guitar, the banjo, the mandolin, and the zither.

FREUND, froint. HERMANN ERNST (1786-1840). A Danish sculptor, born at Uthlede, near Bremen. He was apprenticed to a blacksmith, but afterwards obtained some training at the Academy of Fine Arts at Copenhagen, and in 1817 gained the prize there, which enabled him to travel for three years. In Rome he became the friend of Thorwaldsen, and modeled statues of "Mercury" and "Saint Luke," while still under his influence. In 1827 he executed his masterpiece, the Ragnarök frieze, which was almost destroyed by a fire in the Palace of Christiansborg (1884). Among his other works are "Thor," "Odin," a "Child Riding on a Swan," and many monuments and busts. His life was written by his son Victor Freund and edited by Baumann (Copenhagen, 1883).

FREUND, WILHELM (1806-94). A German classical scholar, born of Jewish parents at Kempen, Posen. He was educated at Berlin, Breslau, and Halle, and taught at Breslau (1828-29), at Hirschberg (1848-51), and at Gleiwitz (1855-70). His great work is the *Wörterbuch der lateinischen Sprache* (1834-45). On the same principle are his *Gesamtwörterbuch der lateinischen Sprache* (1844-45) and the *Lateinisch-deutsches und deutsch-lateinisch-griechisches Schulwörterbuch* (1848-55). The Latin-English dictionaries by Andrews, Smith, Lewis, and Short, and Riddle and White are all based upon his work. Only a little less important than his lexicographical work was the valuable *Wie studirt man Philologie?* (5th ed. 1885). He also wrote: *Tafeln der Literaturgeschichte* (1877); *Triennium Philologicum* (3d ed. 1885); a long series of *Präparationen zu den griechischen und römischen Klassikern*, beginning in 1859; and *Wanderungen auf klassischem Boden* (1889-92).

FREY, fri, or **FREYR** (Icel., lord). The son of Njörd, of the dynasty of the Vanagods. He was adopted with his father among the Æsir, who, when he got his first tooth, bestowed upon him the celestial castle Alheim. He is the god of peace and fruitfulness; dispenses rain and fertility; and to him prayers for a good harvest are addressed. He wakens the earth from the sleep of

winter. His wife is Gerda, daughter of the giant Gymer. Frey had seen her as he once ascended the lofty seat of Odin, *Hlidskjalf*, from which everything on earth is seen. Gerda was so beautiful that the brightness of her arms illuminated air and sea. Seized with love, Frey sent Skirnir as spokesman, and for his services had to give him his sword, which he will miss in the final contest or eclipse of the gods. His magic ship *Skidbladnir*, which could be folded up like a cloth, represents the clouds that dissolve at the rays of the sun. Like Freyja, he was the patron of marriage, and probably the two were at one time conceived as united hermaphroditically. Frey was held in great veneration, especially in Sweden, of which he was patron god, in Norway, and from there also in Iceland. His chief temple was at Upsala, where a bloody offering was yearly made to him of men and animals. His festival was at the winter solstice, and while the god was borne round the land all strife was laid aside. Oaths were often sworn in his name, and he was called on to avenge wrongs. He is even called the god of the world and the prince of gods. It is probable that the goddess Nerthus, described by Tacitus in the *Germania* as *terra mater*, was the wife of Niord, and the mother of Frey. Consult Paul, *Grundriss der germanischen Philologie*, i. (Strassburg, 1896, et seq.).

FREY, fri, EMIL (1838—). A Swiss statesman. He was born at Arlesheim, and after studying at Jena, came to the United States, where, during the Civil War, he fought with distinction in the Union Army, and was advanced to the rank of major. In 1865 he returned to Switzerland, where he became distinguished as a statesman and journalist. He was editor of the *Basler Nachrichten* from 1872 to 1882, in which year he was appointed Minister Plenipotentiary to the United States. Returning in 1888, he was in 1893 elected President of the Swiss Confederation. He became an active promoter of educational reform, and an advocate of international legislation for the regulation of factory service. Scarcely less distinguished have been his services in behalf of the construction of the Saint Gotthard tunnel, and of other avenues of intercourse, the modification of the forestry laws, the extension of the fortification system, and the improvement of the Army. In 1897 he was made Director of the International Telegraph Bureau at Bern.

FREY, FRIEDRICH HERMAN N. See GREIF, MARTIN.

FREY, HEINRICH (1822-90). A German anatomist and zoölogist. He was born at Frankfurt-on-the-Main, and studied medicine at Bonn, Berlin, and Göttingen. In 1848 he was appointed professor of comparative anatomy and histology at Zurich, and professor of zoölogy at the Polytechnic Institute in that city. Most of his works are devoted to histology and microscopy, and are considered among the best productions on those departments of science. Especially important are the following: *Histologie und Histochemie des Menschen* (5th ed. 1876; Eng. transl. by A. E. J. Barker, 1874); *Das Mikroskop und die mikroskopische Technik* (8th ed. 1886; Eng. transl. by G. R. Cutter, 1874); *Grundzüge der Histologie* (3d ed. 1885). He was especially skillful in researches in the subject of microlepidoptera, which topic he discusses in the works entitled *Die*

Tineen und Pterophoren der Schweiz (1856) and *Lepidopteren der Schweiz* (1880).

FREY, JAKOB (1824-73). A German-Swiss novelist, who wrote but little, but that of rare quality. He was born at Gutenschwyl, Canton of Aargau, studied at the universities of Tübingen, Munich, and Zurich, was editor of a paper at Aarau, and afterwards at Bern, and having for some years lived at Basel, settled in 1868 at Aarau, where he died. His collection of tales, *Zwischen Jura und Alpen* (1858), the novel *Die Waise von Holligen* (1863), and the three volumes of *Schweizerbilder* (1864 and 1877), are all works of distinction and artistic genius.

FREY, JOHANN JAKOB (1681-1752). A Swiss engraver, born at Lucerne. His success with several engravings after Guido and Albano gave him a high reputation, which he maintained by his other works. He is not always perfect in his line, but there is so much breadth and serenity about his plates as a whole that the fault is readily forgiven. He engraved a number of Carlo Maratta's pictures, a beautiful "Holy Family" after Raphael, "San Carlo Borromeo" after Pietro Cortona, and reproductions of many other Italian painters of the time.

FREY, JOSEPH SAMUEL CHRISTIAN FREDERICK (1773-1850). An American clergyman, born at Mainstockheim (Bavaria), Germany. As a Jew he was instructed in Hebrew theology, in 1794 became a leader in the Synagogue, in 1798 turned Protestant Christian, and in 1800-07 was a missionary of the London Missionary Society among Hebrews in the United Kingdom. In 1816 he came to the United States, in 1818 founded and was appointed pastor of the Mulberry Street Congregational Church, New York City, and in 1820 established the American Society for Meliorating the Condition of the Jews, whose object was to receive and make provision for Hebrew immigrants from all nations. He left the Congregational Church to join the Baptists in 1827, and after having occupied several pastorates in the Baptist denomination, resigned, and in 1837-40 labored with little success in Europe as a representative of the American Society for the Conversion of the Jews. In 1840 he returned to the United States, and later he settled at Pontiac, Mich., where he was instructor in Hebrew in the preparatory department of the University of Michigan. His publications include: *A Narrative of My Life* (1809); *Judah and Israel* (1837); and *Joseph and Benjamin: A Series of Letters on the Controversy Between Jews and Christians* (2 vols., 1842).

FREYBERG, fr̃b̃erk, KONRAD (1842—). A German painter of military subjects, born at Stettin. He studied in Berlin at the Academy, and under Steffek, making a specialty of horses and military groups, and in 1867 went to Paris, where he took the works of Horace Vernet for his model. In 1870 he accompanied the German army to France, in the suite of Prince Albrecht of Prussia, and settling afterwards in Berlin, depicted a number of episodes from that campaign, among which "Prince Charles of Prussia and Suite before Paris" (1872), "Surrender of Metz" (1877), and "Episode in Battle of Le Mans" (1879) are the more noteworthy. Of his equestrian portraits and groups, those on a smaller scale are the most successful.

FREYCINET, frâ'sé'nâ', CHARLES LOUIS DE SAULCES DE (1828—). A French statesman. He was born at Foix, in the Department of Ariège, and was educated at the Ecole Polytechnique in Paris. In 1856 he was appointed *chef d'exploitation* of the Railway Company of the South. From 1856-61 Freycinet undertook several journeys in the employ of the Government, and published as a result of his observations an admirable work on city sanitation. After the fall of the Empire, Gambetta appointed Freycinet Prefect of the Department of Tarn-et-Garonne, and in October, 1870, he was associated with Gambetta as 'personal delegate of the Minister of War.' In this capacity Freycinet displayed remarkable energy and ability, particularly in the rapid organization of the military railway and telegraph service, and the furnishing of the staff with strategic maps. He retired after the armistice, and published *La guerre en province pendant le siège de Paris* (1872). He was elected to the Senate in 1876; was appointed Minister of Public Works in 1877, and was intrusted with the formation of a Cabinet by President Grévy, in 1879, assuming the portfolio of Foreign Affairs. Not being in accord with Gambetta, he resigned the Premiership in 1880; but on the resignation of Gambetta in 1882, Freycinet formed a new Cabinet, which resigned a few months later, upon being refused a vote of credit for the protection of the Suez Canal. In 1885, on the downfall of the Ferry Cabinet, he was summoned by President Grévy to form a new Ministry; but not succeeding in harmonizing the conflicting elements, he entered the Cabinet formed under Henri Brisson. He formed a new Cabinet in January, 1886, but was forced to resign in December. He was Minister of War from 1888 to 1893, being also Premier from 1890 to 1892. He went out of office, together with the rest of the Cabinet, in January, 1893, as a result of the investigations into the Panama affair. From November, 1898, to May, 1899, Freycinet was once more Minister of War, in the Dupuy Cabinet. In 1887 he was elected a member of the Academy of Sciences, and in 1890 a member of the French Academy. He has written a number of works on engineering and mathematics, among others: *Traité de mécanique rationnelle* (1858), and *De l'analyse infinitésimale* (1860); also *Essais sur la philosophie des sciences* (1895).

FREYCINET, LOUIS CLAUDE DESAULCES DE, (1779-1842). A French naval officer and navigator. He was born at Montélimart in the Department of Drôme, August 7, 1779. In 1795 he took part in several engagements against the English and Spanish, and in 1800 he joined, with his brother Louis Henri, who afterwards rose to the rank of admiral, the expedition sent out under Captain Baudin in the *Naturaliste* and *Géographe* to explore the south and southwest coasts of Australia. Much of the ground already explored by Flinders was revisited. In 1805 Freycinet returned to Paris and was given an appointment in the Department of Marine Maps and Charts. In 1817 he commanded the *Uranie*, in which Arago and others went to Rio de Janeiro to take a series of pendulum measurements. This was part of a larger scheme for obtaining observations, not only in geography and ethnology, but in astronomy, terrestrial magnetism, and meteorology, and for the collection of specimens

in natural history. For three years Freycinet cruised about, visiting Australia, the Marianne, Hawaiian, and other Pacific islands, and South America, returning to France, notwithstanding the loss of the *Uranie*, with fine collections in all departments of natural history. He published several scientific memoirs, and two accounts of his travels: *Voyages de découverte aux terres australes pendant les années 1800-04* (2d ed. 1824-25), and *Voyage autour du monde entrepris par ordre du roi*, in 13 volumes (1824-44). He was one of the founders of the Geographical Society of France.

FREYJA, fri'yä, and **FRIGGA** (Icel., lady, fem. of *Frey*). Two goddesses, spoken of in northern mythology as distinct, but originally one, and intimately associated with Frey. Frigga, in the genealogy of the Æsir (q.v.), is the supreme goddess, wife of Odin, and one of the daughters of the giant Fiörgyn, and presides over marriages. Freyja is the daughter of Njörd, sister of Frey, and goddess of love. She is drawn on a car yoked with cats; to her, deceased women go, and also the half of all men that fall in battle, whence she is called Val-Freyja. In this last respect she must be considered as signifying the earth; but the earth is also represented by Frigga, the wife of Odin, and when Freyja seeks Odin, Odin symbolizes the sun. The names Frigga and Freyja are in signification almost alike, and the two are often confounded in mythology. The Anglo-Saxons and Lombards worshiped the wife of Odin as Frea. The name yet survives, probably, in *Friday*.

FREYLINGHAUSEN, fri'ling-hou'zen, JOHANN ANASTASIUS (1670-1739). A German religious poet, born at Gandersheim. He studied theology at Jena, and in 1692 became permanently established at Halle, where he was chief pastor and director of the Pedagogical Institute. His *Compendium der christlichen Lehre* was translated into English by J. Planta in 1804 under the title, *An Abstract of the Whole Doctrine of the Christian Religion*. His *Grundlegung der Theologie* (14th ed. 1744) was also very popular in its day. It is chiefly, however, as a writer of hymns that Freylinghausen is known, among his principal publications of this kind being the *Geistreiches Gesangbuch* (1714), containing 683 songs, and *Neues geistreiches Gesangbuch*, containing 798 songs. These songs obtained a wide popularity in the Protestant Church service, and have been frequently republished. Freylinghausen is said also to have been an excellent musician.

FREYTAG, fri'täg, GEORG WILHELM FRIEDRICH (1788-1861). A distinguished German Orientalist, born at Lüneburg. He studied theology and Oriental philology at Göttingen, and from 1811 to 1813 acted as tutor there. In 1813 he became public librarian at Königsberg, and in 1815 chaplain in the Prussian Army, in which capacity he visited Paris, and remained there after peace was proclaimed in order to continue the study of Persian, Turkish, and Arabic under the famous De Sacy. In 1819 he was appointed to the professorship of Oriental languages in the recently established University of Bonn, and this post he held until his death. He edited and translated into Latin two volumes of Arabic songs, *Hamasa Carmina* (1828-52), and edited three volumes of Arabic proverbs, *Arabum Pro-*

verbia (1838-43). He also published a Hebrew grammar, and a treatise on Arabic versification. His greatest work, however, was his *Lexicon Arabico-Latinum* (4 vols., 1830-37; abridged edition, 1837).

FREYTAG, GUSTAV (1816-95). A German novelist and dramatic writer of distinction. He was born at Kreuzburg, Silesia, July 13, 1816, studied at Breslau and Berlin, taught as privat-docent at the University of Breslau, and after a brief residence in Dresden went to Leipzig, to become editor of *Die Grenzboten* (1848-70). During this period he had published, together with other dramas of minor interest, *Die Journalisten* (1853), one of the best modern German comedies, still often acted; the admirable novel *Soll und Haben* (1855, translated into nearly all European languages), dealing with the inevitable conflict between the spirit of caste and privilege, rooted in the feudal past of Germany, and the new industrial and democratic spirit of the age; another novel of merit, *Die verlorene Handschrift* (1864); a valuable contribution to the theory of dramatic criticism, *Die Technik des Dramas* (1863), translated into English by McEwen (Chicago, 1894); and the most popular historical essays of his generation, *Bilder aus der Deutschen Vergangenheit* (4 vols., 1859-62). From 1867 to 1870 Freytag represented Erfurt in the North-German Reichstag, and during the French War he was for a time attached to the staff of the Crown Prince. A journal of these days, *Der Kronprinz und die deutsche Kaiserkrone*, published in 1889, revealed, in a way unwelcome to the Court, the liberal tendencies of the deceased Frederick III. and supplemented the brief autobiographic *Erinnerungen aus meinem Leben* that had accompanied Freytag's collected *Works* (22 vols., 1887). His great work since 1870 was the series of historical novels *Die Ahnen* (1872-1880), a monument to the continuity of German character through all the ages of its history and already a classic in its literature. To this national task Freytag gave eight of his maturest years, and he brought to it the preparation of long historic investigations. The stories reach back in *Ingo und Ingraban* to the twilight of German history, and bring the reader to the Christian conversion; show in a second volume, *Das Nest der Zaunkönige*, the growing dominance of the Roman Church; in a third, *Die Brüder vom deutschen Hause*, the struggles of the Teutonic Knights; and in a fourth, *Markus König*, the Reformation and the founding of the Prussian State. The fifth, *Die Geschwister*, deals with the Thirty Years' War; and the last, *Aus einer kleinen Stadt*, with the revival of national life after the humiliations of the Napoleonic conquest. While these novels were appearing, Freytag wrote much for a weekly, *Im neuen Reich*; but in 1879, *Die Ahnen* finished, he withdrew from active life and lived chiefly at Wiesbaden, where he died, April 30, 1895. His complete works were published in 22 volumes (1886-88). For his biography, consult Alberti (Leipzig, 1885), and Seiler (ib., 1898).

FRIANT, fré'ân', Louis, Count (1758-1829). A French general, born at Villers-Morlancourt, Somme. After participating in the wars following upon the French Revolution, he accompanied Napoleon as brigadier-general to Egypt in 1798, and was appointed Governor of Upper Egypt by

Kléber. He fought with distinction at Heliopolis (March 20, 1800) and Cairo, and was appointed general of division; but after a futile defense of Alexandria was compelled to surrender to the allied armies of England and Turkey (August, 1801). In recognition of his merit, the title of count was conferred on him at the coronation of Napoleon. He subsequently participated in nearly all the great battles of the Napoleonic wars, from Austerlitz to Waterloo, his valor and skill being particularly conspicuous in the attack at Wagram.

FRI'AR (OF. *frere, freire*, Fr. *frère*, Sp. *fray, fraile*, It. *frate*, from Lat. *frater*, brother). A generic name applied to the members of certain comparatively modern religious communities in the Roman Catholic Church, in contradistinction to the older title of monk, which designated especially the Benedictines and their branches, and is only applied by incorrect popular usage to the mendicant Orders. The founders of the Dominican and Franciscan Orders, from motives of humility, chose the simple title of brother to designate their followers. Saint Francis called his *fratres minores* friars minor (lesser brothers), while Saint Dominic gave his Order the name of *fratres prædicatores* (preaching friars). The popular English names of these Orders, derived from the color or other distinguishing mark of their habit—such as gray friars (Franciscans), black friars (Dominicans), white friars (Carmelites), crutched friars (Canons Regular of the Holy Cross), and Austin friars (Augustinians)—are preserved to this day in the names of streets and localities in English towns. See MONASTICISM.

FRIAR BACON. A popular title for Roger Bacon. It is employed in a play by Robert Greene, entitled *The Honorable History of Friar Bacon and Friar Bungay*, printed by Edward White, in quarto (1594), and played at Devonshire House in 1591. A prose work, first printed in 1627, was reprinted in Thoms's *Early English Prose Romances* (Pickering, London, 1828), under the title of *The History of Friar Bacon*.

FRIAR-BIRD (so called from its bare head, the ruff of feathers about its head, and its sober plumage). A well-known Australian honey-eater (*Philemon corniculatus*). It also has other names, as 'Pimlico' and 'four o'clock,' imitative of its loud cry. Several species of the genus inhabit Australia and the Malayan islands to the northward. All are dull drab in color, have the head and neck more or less bare of feathers, and the culmen of the large curved bill furnished with an excrescence. They inhabit the tree-tops, go in small flocks, and are strong, bold, noisy birds, well able to defend themselves. An interesting circumstance connected with them is the fact that in each island where a local species exists there also exists an oriole which 'mimics' its appearance perfectly (see MIMICRY), and thereby escapes much harm from enemies that might easily overcome it did they not mistake it for the more powerful friar-bird. Consult Wallace, *Darwinism* (London, 1889).

FRIAR RUSH. See RUSH, FRIAR.

FRIAR'S TALE, THE. In Chaucer's *Canterbury Tales*, the tale told by the friar Hubert. An archdeacon's summoner enters into a compact

with Satan, whom he meets disguised as a yeoman, and is himself carried off by the fiend.

FRIAS, fré'ás, TOMÁS (1805-84). A Bolivian statesman, born at Potosi. He was Secretary of State under several Presidents, until the assassination of Morales in 1872, when he was selected to conduct the affairs of the Government as Acting President. Upon the installation of Ballivian (May, 1873), he became Vice-President, and after the death of the latter succeeded to the Presidency (February 14, 1874). Two years after the completion of his term of office (1877) he was sent as Minister to France. He was considered one of the foremost statesmen of South America, and his influence upon the political development of Bolivia can scarcely be overestimated.

FRIBOURG, fré'boor', or **FREIBURG**, frí'boork. A western canton of Switzerland, situated between the cantons of Bern, Vaud, and Neuchâtel (Map: Switzerland, B 2). It has an area of 645 square miles. The southeastern part is high, and may be said to belong to the Bernese Oberland region; the northwestern part belongs to the basin of Lake Neuchâtel. The main rivers are the Saane and the Broye. The mountain forests furnish wood for export; limestone, gypsum, and pitch coal are found. Of the total area, 88 per cent. is productive. Grain, fruit, potatoes, tobacco, and grapes are grown. Dairy products, especially cheese, are exported. Fribourg produces a fine grade of draught-horses, and gives its name to an excellent breed of black cattle. Its manufactures are not important. They include watches, paper, tobacco and cigars, glass, and products of the loom. Straw-plaiting and tanning are leading industries. The canton is administered by a Grand Council, elected by the people, one member for every 1200 inhabitants, and by a State Council consisting of seven members. It sends six representatives to the National Council.

The population in 1888 was 119,155; in 1900, 127,951. The inhabitants are mostly Catholics. French is the official language of the canton, though legislative measures are published also in German. The educational institutions comprise the university at the capital, Fribourg (q.v.), a seminary, a college, and many secondary, elementary, and industrial schools. The ancient dwellers of the land were the Celtic Helvetii. During the great barbaric migrations the district was occupied by the Alemanni in the east and the Burgundians in the west. In the sixth century it came into the possession of the Franks. It passed under the control of the Holy Roman Empire in 1032. The inhabitants refused to allow the spread of Protestantism within their borders. In 1798 the French occupied the land, and it remained under French influence till 1814. The canton, which has always been ultramontane and conservative, is the only one without the referendum and with restricted popular rights. Consult: Berchtold, *Histoire du canton de Fribourg* (Freiburg, 1841-45); Marrot, *Chronique du canton de Fribourg* (ib., 1878).

FRIBOURG, or **FREIBURG**. The capital of the Swiss canton of the same name, situated on the Saane, 19 miles southwest of Bern (Map: Switzerland, B 2). The town stands on a promontory, is ancient, and is irregularly built, with many walls and towers. The river is crossed by

a number of fine bridges, including two of the suspension type, of which the larger, built in 1832, is 828 feet long. The most notable buildings are the Church of Saint Michael, formerly belonging to the Jesuits, and the town hall, with its Gothic clock-tower. Among the educational institutions are the university (founded in 1889), the College of Saint Michael, and the lyceum, containing the cantonal museum. The chief manufactures of the town are tobacco, pasteboard, leather, and artistic objects. Two-thirds of a mile south of the town the Saane is dammed. The water-power thus derived is made use of by the factories. Population, in 1888, 12,195; in 1900, 15,794.

FRIČ, or **FRICTSCH**, frích, ANTON JOHANN (1832—). A Bohemian geologist and zoölogist, brother of Joseph Václav Frič, born and educated at Prague. He became professor in the Czech University at Prague and was also director of the zoölogical and paleontological department of the Museum of Bohemia. A skilled ornithologist and ichthyologist, he did much to develop Bohemian fisheries. Among his writings are: *Les oiseaux d'Europe* (1832); *Naturgeschichte der Vögel Europas* (1853-71); *Cephalopoden der böhmischen Kreideformation* (1872); *Geologische Bilder aus der Vorzeit Böhmens* (1873); *Die Reptilien und Fische der böhmischen Kreideformation* (1878); *Fauna der Gaskohle und der Kalksteine der Permformation Böhmens* (1879 sqq.); *Fischereikarte des Königreichs Böhmen* (1888); and *Der Elbelachs* (1894).

FRIČ, JOSEPH VÁCLAV (1829-90). A Bohemian poet, born in Prague. He took so active part in the risings of 1848-49 that he was punished by imprisonment and exile. He went to London in 1859, then to Paris and to Berlin, and in 1879 returned to Prague. His literary productions include the violent anti-Austrian pamphlet, *Pláč koruny české* (1866); contributions to the Czech periodicals *Blaník* and *Correspondance tchèque*, and to the *Agramer Zeitung* (1870-77); the historical work, with Leger, *La Bohême historique, pittoresque et littéraire* (1868); the dramas *Svatopluk*, *Ulryk Hutten*, and *Mazeppa*; and lyric poems in a Byronic manner, of which *Upír* (1849) is the best example. His collected works, *Sebrané spisy*, were published at Prague (1879-80), and his memoirs appeared in four volumes (Prague, 1885-87). He frequently used the pseudonym 'Brodsky.'

FRICTION (Lat. *frictio*, a rubbing, from *fricare*, to rub). If a solid body with a flat surface rests on a horizontal table, it requires a definite force to start it moving; and if it is set in motion, it will come to rest unless acted upon by a sufficient force. These phenomena are said to be due to the force of 'friction' between the two surfaces. It is found by experiment that the force required to start the motion of one body over the other varies directly as the force pressing the surfaces together, but is independent of the area of contact. The ratio of the force required to produce motion to the force pressing the surfaces together is called the 'coefficient of statical friction.' It varies largely for different kinds of material, and is always diminished by lubricants.

Similarly, if one body is caused to slide over the other, a definite force is required to prevent its motion being retarded; in other words, a force

is required to maintain a uniform speed. This force bears a definite ratio to the force pressing the surfaces together, which is called the 'coefficient of kinetic friction,' and is independent of the area of contact. This coefficient is different for different materials, and for the same substances is less than 'the coefficient of statical friction.' It is independent, further, within certain limits of the degree of speed. Some values of this coefficient of kinetic friction are as follows: Oak on oak, fibres parallel, 0.48; the same, with surfaces rubbed with dry soap, 0.16; iron on oak, fibres parallel to motion, 0.62; iron on iron, surfaces well lubricated, 0.04.

The resistance noticed when a wheel rolls on a plane surface with no slipping is not a true case of friction, although it is sometimes called 'rolling friction.' It is due to the plane surface becoming deformed and rolled up in front of the advancing wheel, or to the wheel itself flattening out. This opposition is, however, in most cases extremely small, when compared with sliding friction. Whenever work is done in overcoming friction, the surfaces which are rubbed over each other experience heat effects, and thus friction always causes loss of available mechanical energy. On the other hand, without friction most motions would be impossible—e.g. a man walking, a belt driving a pulley, a train moving on a track, etc. If there were no friction, all these motions would necessarily be produced by cog-wheels or their equivalents.

Friction between solids is due to slight unevennesses on the surfaces in contact, and is therefore what may be called a force between the minute portions of the bodies, and heat effects are produced. The exact mechanical explanation is not evident. In the case, however, of friction between moving layers of liquids or gases it is. It is known that all molecules of these forms of matter are moving about at random through distances which are considerable with respect to their own size; if, then, a layer of fluid is moving relatively with reference to a contiguous layer—e.g. the currents produced in a tumbler of water by stirring a spoon in it, or the currents of air produced by whistling—molecules move freely from one layer into the other. The effect is exactly that of having two long trains of cars, or movable platforms, on parallel tracks, one train in motion, the other not; if enough people step back and forward from one train to the other, the moving one will be slowed up, the one at rest will be set in motion, and finally both trains will be moving at the same speed. If one train is kept at rest, the other will be brought to rest also. Thus, moving layers of liquids and gases are brought to rest. The kinetic energy of the currents goes into increasing that of the molecules, and the temperature is raised. Friction between layers of fluids is sometimes called 'viscosity,' and a fluid is said to be 'viscous' if this frictional force is large.

There is thought to be little, if any, friction between a fluid and a solid, when, for example, the fluid is flowing through a pipe or tube; in general there is a layer of the fluid close against the solid and attached to it, so that any friction is between this layer and the rest of the fluid. In case of a liquid which does not 'wet' a definite solid, the conditions are of course different.

There is still another case of friction to be considered, that between portions of a solid body when it is making elastic vibrations; e.g. a vibrating tuning-fork or spiral spring. When any solid is deformed there is always to a greater or less degree a slipping of layers of the solid over each other, and thus there is produced 'internal' friction. Owing to this, the energy of vibration of the body decreases, the vibrations cease, and the body as a whole has its temperature raised.

FRIDA, frē'dá, EMIL BOHUSCH (1853—). A Czech poet, whose pen-name is Jaroslav Vrchlický. He was born at Laun, Bohemia, was educated at Prague, and was appointed professor of literary history in the Czech university there in 1893. In 1901 he was called to the Austrian House of Peers. His poetic works comprise epics, tragedies, comedies, several novels, and translations from the best writers of France and Italy. Many selections from his works have been translated into German.

FRIDAY (AS. *Frigedæg*, *Frigdæg*, OHG. *Friatag*, Ger. *Freitag*, from AS. *Frige*, OHG. *Fria*, Icel. *Frig*, a goddess partly identified with the Roman Venus + AS. *dæg*, Ger. *Tag*, day; a German translation of the Latin name *dies Veneris*, day of Venus, whence It. *venerdì*, Fr. *vendredi*, Friday). The sixth day of the week. Among the Germanic peoples it was sacred to the goddess named above, the wife of Odin. In the Christian Church it was in very early times consecrated to the commemoration of the crucifixion of Christ, which took place on that day. (See GOOD FRIDAY.) The superstition that Friday is an unlucky day may probably be traced to association with this event. Clement of Alexandria, Epiphanius, and other early writers describe the custom of marking it by fasting and prayer. In the Roman Catholic Church it has always and everywhere been a day of abstinence from flesh meat, except when Christmas falls on a Friday. The Anglican churches also designate all Fridays (with the same exception) as days of fasting or abstinence. Since the spread of the devotion to the Sacred Heart of Jesus in the last two centuries, the first Friday of every month has been a day marked for devout Roman Catholics by special observances in honor of it. Among the Mohammedans it is the day for religious gatherings, said to have been chosen by Mohammed in memory of the creation of man, as well as to differentiate his followers from Jews and Christians. They are not required to rest from labor except during the time of the Friday midday prayer, at which all adult males are required to be present. Those who absent themselves on three successive Fridays without a valid excuse are considered to have renounced their faith.

FRIDAY. In Defoe's *Robinson Crusoe*, a savage whom Robinson Crusoe saved from death on Friday, and who became his faithful servant.

FRIDAY CLUB, THE. A social club, started by Sir Walter Scott, in June, 1803. It met at Fortune's Tavern, and was probably modeled on Johnson's famous 'Club' at the Turk's Head. A list of the members is given in Lockhart's *Life of Scott*, vol. ii. (Edinburgh, 1850).

FRIDERICIA, fré'dá-ré'sé-á, JULIUS ALBERT (1849—). A Danish historian. He was born and educated at Copenhagen, and was appointed assistant librarian at the university library in that city in 1891. Many of his works are based upon a careful study of the archives of Denmark, Sweden, Holland, England, Germany, France, and other European countries. His principal works comprise: *Danmarks ydre politiske Historie i Tiden fra Freden i Lybek til Freden i Brömsebro*, 1629-60 (1876-82), and *Adelsvældens sidste Dage, Danmarks Historie fra Christian IV's Død til Enevældens Indførelse* (1894). In collaboration with Bricka he published *Christian IV's egenhændige Breve* (1878-91).

FRIDOLIN, fré'dó'lán', or **FRIDOLD**, fré'dólt (less frequently TRIDOLIN, or TRUDELIN), SAINT. A Christian missionary of the sixth century, called 'the First Apostle to Allemannia.' All that is known of him is derived from a life written four centuries later by Balther, a monk, and containing a great amount of legend, intermingled with historical fact. According to this work, he was a Scot, who, after labors among his heathen countryfolk, went to Poitiers, where he restored the Church of Saint Hilary, much impaired through Arian heresy, to its former prosperity. He afterwards founded a church and a monastery on the island of Säkingen, in the Rhine. He is the patron saint of the Canton of Glarus, Switzerland, on whose coat-of-arms he appears. His day is March 6th. An edition of Balther's *Life* is contained in Mone's *Quellensammlung der badi-schen Landesgeschichte*, vol. i. (Karlsruhe, 1845). Consult also: Heber, *Die vorkarolingischen Glaubenshelden* (Göttingen, 1867), and Heer, *Sankt Fridolin, der Apostel Alemanniens* (Zurich, 1888).

FRIEDBERG, fréd'bérk, EMIL ALBERT (1837—). A German canonist. He was born at Konitz, West Prussia, and was educated at Berlin and Heidelberg. After having been professor in the universities of Halle and Freiburg, he was appointed a member of the faculty at Leipzig in 1869. The new critical edition of the *Corpus Juris Canonici* (1879-81) was prepared by him, as was also the *Formelbuch des Deutschen Handels-, Wechsel- und Seerechts* (3d ed. 1894). Alike in his collaboration in the Prussian Church laws of 1872 and as an author, he showed himself a champion of State supremacy in ecclesiastical matters, and many of his works deal with this subject in its various bearings. Perhaps the best known of his numerous publications are the following: *Die Geschichte der Civilehe* (2d ed. 1877); *Lehrbuch des katholischen und evangelischen Kirchenrechts* (3d ed. 1889); and *Verfassungsgesetze der evangelisch-deutschen Landeskirchen* (1885 et seq.).

FRIEDEL, fré'dél', CHARLES (1832-99). A French chemist and mineralogist, born at Strassburg. He was educated at the Protestant gymnasium, and subsequently studied, under Pasteur, at the University of Strassburg. After spending a short time in his father's banking business, he went to continue his studies in Paris, where he resided with his grandfather, the celebrated zoölogist Duvernois. After a thorough preparation in the mathematical sciences, he entered the laboratory of Wurtz, with whom he soon formed a close friendship. In 1869 he pre-

sented two remarkable theses, one in organic chemistry and one in mineralogy, which immediately attracted to him the attention of the scientific world. In 1871 he became instructor in mineralogy at the Ecole Normale Supérieure, and in 1876 succeeded Delafosse as professor of mineralogy at the Sorbonne. Two years later he succeeded Regnault as member of the Institute. On the death of Wurtz, in 1884, Friedel was appointed professor of organic chemistry and director of the research laboratory at the Sorbonne, a position which he retained to the end of his life. In 1892 he organized and became director of the Ecole de Chimie, a school of industrial chemistry connected with the University of Paris. Friedel's researches contributed extensively to the development of organic chemistry and synthetic mineralogy. The results embodied in his two hundred and fifty-four original memoirs have, without a single exception, joined the structure of science as valuable and indisputably correct data. His classic researches on the acetones, his discovery of the secondary alcohols, his total synthesis of glycerin, his discoveries of many new mineral species and of methods of reproducing many minerals artificially, his discovery of the pyro-electric properties of minerals, his researches on the chemistry of silicon and its organic compounds, and his discovery, jointly with James Mason Crafts, of the synthetic method well known as 'the Friedel and Crafts reaction,' entitle him to a place among the foremost experimental scientists of the nineteenth century. The Friedel and Crafts reaction consists in the action of various chlorinated compounds on hydrocarbons in the presence of aluminum chloride, thousands of different organic compounds being thus conveniently prepared on any ordinary scale. For example, triphenyl methane, which is employed in the manufacture of a number of valuable dyes, can thus be readily prepared in any desirable quantity. As to the compounds of silicon, Friedel, working in conjunction, partly with Crafts, partly with Ladenburg, showed that the element silicon is, like carbon, quadrivalent, and obtained a series of compounds perfectly analogous to the hydrocarbons and capable of yielding many substances perfectly analogous to derivatives of the hydrocarbons. Friedel's book-form publications include a text-book of mineralogy and crystallography, and a work on organic chemistry, entitled *Cours de chimie organique professé à la faculté des sciences de Paris* (2 vols., 1887).

FRIEDELITE. A crystalline mineral magnesium chloro-silicate discovered by Bertrand in the mines of Adervielle. It has a dark-red color and is translucent. It was named in honor of Charles Friedel (q.v.).

FRIEDENTHAL, fré'den-thäl, KARL RUDOLF (1827-90). A German statesman. He was born at Breslau, and was educated at Breslau, Heidelberg, and Berlin. He became a member of the North German Reichstag in 1867, and was one of the founders of the party known as the Free Conservatives. He was a member of the conference convened at Versailles during the Franco-German War to assist in framing the Constitution of the new German Empire. In 1874 he was appointed Minister of Agriculture, and resigned his post in 1879. His influence upon the economic

development of the German Empire was most important.

FRIEDERIKE VON SESENHEIM, frë'dër-ê'ke fôn sâ'zen-him. See BRION, FRIEDERIKE ELISABETH.

FRIEDLAND, frëd'lânt, *Eng. pron.* frëd'land. A town of East Prussia, on the left bank of the Alle, 26 miles southeast of Königsberg. It is celebrated as the scene of one of Napoleon's most splendid victories, gained over the Russians under Bennigsen, June 14, 1807. On June 10th the corps of Soult, Lannes, and Murat had delivered an attack on the Russian intrenchments at Heilsberg, and had been repulsed with a loss of nearly 10,000 men. Napoleon thereupon swung his army to the north of Heilsberg and took up the march for Königsberg, hoping by this manœuvre to entice the Russian commander from behind his fortifications. On the 11th Bennigsen abandoned Heilsberg, and for three days, till the 13th, the two armies were engaged in a race for the threatened town, the Russians advancing by the right bank of the Alle, the French to the left of the river, and at some distance away. On June 13th the corps of Murat and Davout were in the neighborhood of Königsberg; Soult was at Kreutzburg, about 10 miles south of Königsberg, and Lannes was at Domnau, some 15 miles southeast of Kreutzburg. Napoleon, with the Guard and the corps of Victor, Ney, and Mortier, was at Preussisch-Eylau, about five miles from Domnau. Early in the morning of June 14th Bennigsen began the crossing of the Alle at Friedland, in the hope, probably, of surprising Lannes's isolated corps. Had the passage of the river and the attack on Lannes been carried out with rapidity and decision, victory would have certainly resulted for the Russians. But Bennigsen's dilatoriness and Lannes's intrepid resistance allowed time for Napoleon to arrive on the field of battle with the main body of troops and to turn the advantage of numbers in favor of the French, 70,000 against 55,000. The position of the Russians was perilous in the extreme, with the greater part of their forces hemmed in within a narrow arc of the Alle curving behind them. In case of disaster their only means of retreat were the bridges across the Alle at Friedland. Against these bridges, as the key of the situation, Napoleon directed his attack. Mortier, on the left wing, was ordered to content himself with merely holding the enemy in check, while Ney, on the right, was sent against Friedland. The battle began about six o'clock in the afternoon. Ney advanced to the attack under cover of a heavy artillery fire, but his ranks were immediately thinned under the withering cannonade and were thrown back in utter confusion by a smashing charge of the Russian Household Cavalry. The corps of Victor and the division of General Dupont were thrown into the breach, while Sémarmont with thirty guns took up a position 100 yards in front of the infantry line and drove back the Russian cavalry, gaining time for Ney to rally his divisions. A charge by Latour-Maubourg's dragoons and a further advance of Sémarmont's batteries decided the fate of the battle. The Russians fled through Friedland pursued by Ney and Dupont, a part of the army with 120 guns reaching the right bank of the Alle before the bridges were burned. The Russian right, meanwhile, under Gortchakoff, had

been skirmishing with Mortier; upon the retreat of Bennigsen, Gortchakoff attempted to retake Friedland, but, failing, was forced to move northward along the river in search of a fording-place, losing one-third of his men in the passage of the river. The loss of the Russians in the battle was nearly 20,000 killed and wounded; the French loss was less than half that number. On June 19th Königsberg fell into the hands of the French; and on June 25th occurred the meeting between Napoleon and the Emperor Alexander at Tilsit (q.v.). Population, in 1900, 2824.

FRIEDLAND, VALENTIN (1490-1556). A German educator, generally called Trotzendorf, from the little village in Upper Lusatia where he was born, February 14, 1490. He taught for a time in the school at Görlitz, soon after obtaining his baccalaureate from the University of Leipzig; but, adopting the principles of Luther and Melancthon, he was obliged in 1518 to give up his instructorship. In 1523 he became rector of the gymnasium at Goldberg, in Silesia, for a brief period; he came a second time to Goldberg in 1531, in the same capacity, and remained for over twenty years, making the school so famous throughout Europe that it often had several hundred pupils at once. The school administration was modeled on that of the Roman Republic, thus affording a measure of self-government among the pupils; and Latin was the only language allowed in and out of school. The utter destruction of the buildings by fire in 1554 compelled a removal to Liegnitz, and here Friedland, while superintending the erection of new buildings at Goldberg, died, April 26, 1556. For his biography, consult Pinzger (Hirschberg, 1825) and Löschke (Breslau, 1856).

FRIEDLÄNDER, frëd'lën-dër, DAVID (1750-1834). A German Hebrew scholar. He was born in Königsberg, Prussia, and was attracted to Berlin by the reform movement under Mendelssohn. There he devoted himself to the emancipation of the Jews, and labored assiduously to improve their condition. He contributed to Mendelssohn's great biblical work, *Das Buch Koheleth* (1772), and also published: *Aktenstücke, die Reform der jüdischen Kolonie in den preussischen Staaten betreffend* (1793); *Sendschreiben an den Propst Teller von einigen Hausvätern jüdischer Religion* (1799); and *Ueber die Verbesserung der Israeliten im Königreich Polen* (1819).

FRIEDLÄNDER, FRIEDRICH (1825-1901). An Austrian painter, born at Kohljanowitz, Bohemia. He studied at the Academy of Vienna, and was a pupil of Waldmüller. Afterwards he studied abroad. His pictures, which are of genre or historical subjects, include: "The Death of Tasso" (1852); "The Interrupted Division" (1863); "Hour of Rest" (1865); "The War Veterans" (1875); "News" (1883); "Distribution of Wine" (1884); and the "Mont-de-Piété" (1886).

FRIEDLÄNDER, JULIUS (1813-84). A German numismatist. He was born in Berlin, and was educated at Bonn and Berlin. During the last thirty years of his life he was director of the cabinet of coins in the Berlin Museum, which establishment was greatly enlarged under his management. He edited the *Aufsätze und Briefe* of G. Schadow (2d ed. 1890), and published works on the coins of the Knights of Saint John

(1843), the coins of Justinian (1843), and on those of the Ostrogoths (1844) and Vandals (1849); also a monograph entitled *Das königliche Münzkabinett* (with Sallet, 2d ed. 1877).

FRIEDLÄNDER, LUDWIG (1824—). A German classical philologist and archaeologist, born at Königsberg. He was educated at the gymnasium of his native town and at the universities of Leipzig and Berlin. He became privat-docent at Königsberg in 1847, and full professor in 1858. In 1892 he retired, and has since lived in Strassburg. Friedländer's studies have been chiefly concerned with Roman archaeology and the history of Homeric criticism. His most important works are: *Die homerische Kritik von Wolf bis Grote* (1853); *Analecta Homerica* (1859); *De Operibus Anaglyphis in Monumentis Sepulcralibus Græcis* (1847); *Ueber den Kunstsinne der Römer in der Kaiserzeit* (1852); *Darstellungen aus der Sittengeschichte Roms*, etc. (6th ed. 1889-90); and an edition of *the Cena Trimalchionis of Petronius* (1895).

FRIEDMANN, fréd'mán, ALFRED (1845—). A German author and poet. He was born at Frankfurt-on-the-Main, was educated at Heidelberg and Zurich, and became established at Berlin in 1886. He is distinguished alike as a poet and novelist, his poetic productions being characterized by a thorough mastery of form and diction. His works include: *Die Feuerprobe der Liebe*; *Angioletta*, two poems (3d ed. 1879); and the novel *Zucci Ehen* (3d ed. 1890). His more recent novels are entitled *Inez de Castro* (1898), and *Tantalus* (1901).

FRIEDREICH, fréd'rík, NIKOLAUS (1825-82). A German physician. He was born at Würzburg, and was educated in that city and at Heidelberg. In 1857 he was appointed professor of pathology in the University of Würzburg, and director of the Anatomical Institute. From 1858 until his death he held the chair of pathology and therapeutics at Heidelberg, and was clinical director there. In addition to "Die Krankheiten der Nasenhöhlen, des Larynx und der Trachea," in Virchow's *Handbuch der speciellen Pathologie* (1854), he published a valuable work on cardiac diseases, entitled *Die Krankheiten des Herzens* (2d ed. 1867).

FRIEDRICH, fréd'rík, JOHANNES (1836—). A German theologian and historian, prominent as a leader of the Old Catholics. He was born at Poxdorf, studied at the universities of Bamberg and Munich, was ordained a Catholic priest in 1859, and in 1865 became professor of theology in the University of Munich, and in 1867 a member of the Academy of Sciences. The most noticeable of his works is the *Kirchengeschichte Deutschlands* (1867-69). He was a pupil of Döllinger, and in 1869 was called to the Vatican Council at Rome. His *Tagebuch während des Vatikanischen Konzils geführt* (1871) and *Documenta ad Illustrandum Concilium Vaticanum* (1871) are important sources of information concerning the proceedings. This council indorsed the Papal infallibility dogma, which Friedrich with Döllinger strongly opposed. Friedrich was consequently excommunicated in 1871, and in 1882 the Minister of Public Worship, yielding to Ultramontane pressure in the Chamber, transferred Friedrich from the chair of theology to that of history. He opened in 1874 the Old-Catholic theological faculty at the University of Bern, and lectured

there for a year. Among his works may be mentioned: *Der Mechanismus der vatikanischen Religion* (1870); *Geschichte des Vatikanischen Konzils* (1877-87); *Beiträge zur Geschichte des Jesuitenordens* (1881); *Johann Adam Möller, der Symboliker* (1894); and *Jacob Frohschammer* (1896).

FRIEDRICH, JOHN (1858—). An American violin-maker, born at Cassel, Germany. He was a pupil of Oswald Mückel, a prominent German violin-maker and repairer, came to the United States in 1883, and in a short time ranked among the American leaders in his profession. In addition to violins he has made also bows, violas, and violoncellos of high quality. He received the highest award bestowed for violins, violas, and violoncellos at the World's Columbian Exposition, Chicago, 1893. He has also become known among collectors as an expert in the identification and valuation of rare instruments. Four of the choicest specimens of his violins are in the possession of Dr. Frank Waldo, of Cambridge, Mass.

FRIEDRICH, KASPAR DAVID (1774-1840). A German landscape painter, born at Greifswald. First instructed there by Quisdorf, he studied afterwards at the academies of Copenhagen and Dresden, and fed his fancy in the course of his wanderings on the Baltic coast, in the island of Rügen, and later among the Harz Mountains and the Riesengebirge, became one of the principal exponents of the then dawning romanticism in art. In 1817 he was made a member of and professor at the Dresden Academy. A masterly series of drawings in sepia, depicting scenery in Rügen and other regions near the Baltic coast, are among his most highly prized works. Prominent among his oil paintings are "View in the Harz," and "Moonrise by the Sea" (1823), in the National Gallery, Berlin; and "Repose During Hay Harvest" (1835), in the Dresden Museum.

FRIEDRICH, WOLDEMAR (1846—). A German historical painter and illustrator, born at Gnadau, Province of Saxony. He studied in Berlin under Steffek, and in Weimar under Plockhorst, Ramberg, and Verlat; took part in the Franco-German War of 1870-71, and after a visit to Italy, in 1873, returned to Weimar, where he was made professor at the School of Art in 1881. Called to Berlin in 1885 as instructor at the Academy, he was awarded the gold medal in 1886 for his allegorical ceiling-painting in the Exhibition Building. Among several other decorative works on a large scale are to be especially noticed "The Diet of Worms" (1892), in the Aula of the Gymnasium at Wittenberg, and the two mural paintings "Art and Science," and "Book-Trade and Printing," in the Booksellers' Exchange at Leipzig. A series of landscapes and genre pictures in water-colors and the illustrations to his work *Sechs Monate in Indien* (1893) were the fruits of a journey to India. In 1889 he became a member of and professor at the Berlin Academy.

FRIEDRICHSRUH, fréd'ríks-roō. A village and railway station of Lauenburg, Prussia, 16 miles southeast of Hamburg by rail. Population, in 1900, 279. Its celebrity is derived from the proximity of the castle and estate of the Bismarck family, where Prince Bismarck (q.v.) died and is buried.

FRIENDLY, Sir JOHN. A character in Vanbrugh's *The Relapse*, the model of Colonel Townley in Sheridan's *A Trip to Scarborough*.

FRIENDLY ISLANDS. See TONGA ISLANDS.

FRIENDLY SOCIETY. The name given to English benefit associations established as a rule by the workmen themselves for certain forms of self-help, but now developed into mutual insurance societies. The origin of the friendly society is frequently ascribed to the mediæval guild. They began as sick-clubs composed of small groups, usually neighbors, who met at the public houses, uniting conviviality with the payment of sick benefits and funeral expenses. The large orders arose from the renewed interest of the eighteenth century in Free Masonry. At first they had no regular benefit funds, but grants were made to members in distress. After 1834, when the Poor Laws were changed and the opportunities for thrift were better, societies increased rapidly. Since 1870 an effort has been made to put them on a stronger financial basis.

In general the benefits given by friendly societies are for sickness and funeral allowances. The question of superannuation funds is now important. Other forms of benefit sometimes found are: endowments, insurance for shipwrecks, loss or damage to boats, nets, tools, or implements, medical aid dispensaries, widows' and orphans' funds, convalescent homes, asylums for the aged, and traveling relief for those out of employment. Formerly many local societies existed, but they are gradually disappearing. A frequent form was the dividing society, which shared the surplus at the end of the year. The strongly centralized societies have no social union, but only a business relationship with their members, as the dues are paid through agents or the post-office.

The members are usually clerks, tradesmen, or highly paid artisans. There are two kinds of societies, not properly friendly societies: (1) deposit societies with savings-bank features; and (2) burial societies—some merely local clubs, others large societies with many abuses, in which the cost of the management is 40 to 55 per cent., and which appeal to the poorest classes. Many children are insured in them. There are funeral and local factory and shop clubs for particular trades—often compulsory and subsidized by employers. The large railroad and coal-mining societies provide principally for accidents. The most important friendly societies are the affiliated orders, including the temperance societies and containing the pick of English workmen and of the lower middle class. The orders are democratic social centres, thoroughly educational in character. Societies for women have not been very successful. The United Sisters' Friendly Society (1885), however, promises well. Juvenile branches lately started have prospered.

Many friendly society acts have been passed since 1783. The act of 1875 is especially important. Royal commissions have made valuable reports (especially those of 1825-27 and 1870-74), showing the weaknesses due to small contributions, mismanagement, and competition. These reports and permissive legislation, providing a legal status and supervision, have aided reform. The solvency of many societies is doubtful. Many societies are still unregistered, and hence sta-

tistics are inaccurate. In 1892 there were 29,742 societies, of which 24,598 gave in returns, comprising 8,320,262 members and funds amounting to £26,003,061. The Independent Order of Odd Fellows, Manchester Unity (1822), with 698,328 members in 1897, and an income of £1,294,233, and the Ancient Order of Foresters (1835), with 656,919 members, and an income of £1,240,559, are the leading affiliated orders. The Heart of Oak Benefit Society and the Rational Aid and Burial Association are representative of the centralized associations. Since 1870 the friendly societies have formed an association to watch legislation and protect their interests. This has led to coöperation through medical aid associations and investment associations. Scotland has many societies; they are a later growth in Ireland; several have been introduced into Australia, Canada, and the United States. The friendly society has an important place in the development of the English workingman, but it does not reach equally all grades of the working class, especially the very poor and helpless. Consult: Baernreither, *English Associations of Working Men* (trans. by Alice Taylor, London, 1893); Wilkinson, *The Friendly Society Movement* (London, 1886); id., *Mutual Thrift* (London, 1891); *Nineteenth Century*, 45, 891. See BENEFIT SOCIETIES; INSURANCE; OLD-AGE PENSIONS; POOR LAW.

FRIEND OF MAN, THE. A sarcastic popular title for Victor Riquetti, Marquis de Mirabeau, the father of the revolutionist. It was suggested by the title of his work, *L'Ami des Hommes*.

FRIENDS, THE, or THE SOCIETY OF FRIENDS. A denomination of Christians often known as Quakers, dating from about 1647. In spite of cruel and severe persecutions, the Friends succeeded in establishing themselves in Europe and America. They have never been numerically powerful, having at no time exceeded, if indeed they have ever reached, 200,000 members; but the purity of life which has so honorably distinguished them as a class, has unquestionably exercised a salutary influence on the public at large; while in respect to certain great questions affecting the interests of mankind, such as *war*, *slavery*, and *oaths*, they have, beyond all doubt, originated or emphasized opinions and tendencies which are no longer confined to themselves, but have widely leavened the mind of Christendom.

HISTORY. The founder of the Friends was George Fox (q.v.), who was born in Fenny Drayton, Leicestershire, England, 1624. He began to preach about 1647, and soon drew around him many who, like himself, were "dissatisfied with the teachings and practices of the day, and were longing for a higher and more spiritual life." Neither Fox nor his adherents at first had any intention of establishing a new branch of the Church. Such a result, however, was inevitable from the doctrines which they preached, for such were practically incompatible with the practices of the denominations then existing.

For three or four years Fox's missionary labors were, for the most part, confined to the central part of England. But in 1652 he came into Lancashire, to Swarthmoor Hall, near Ulverstone, the residence of Judge Fell and his wife, Margaret. This able woman became one of Fox's strongest adherents and supporters. From her

house as a centre, a band of sixty Quaker missionaries went forth to preach the doctrines of the new religious movement. The continual travels of Fox, and the labors of this band of preachers, enforced by the simplicity, the truthfulness, and the spiritual power of their message, soon gathered thousands of adherents. It is estimated that in London alone there were 10,000. It has often been said that these early preachers were ignorant men from the lower classes. Such a statement is very far from being the truth, as among them were former Independent ministers, officers of Cromwell's army, schoolmasters, and not a few persons of property.

The doctrines held by the Friends, and their refusal to take any oath, to pay tithes, to obey laws deemed by them iniquitous, such as the 'Conventicle Act' and the 'Five-mile Act,' brought them into constant conflict with the authorities. During the twenty-five years of the reign of Charles II. 13,562 were imprisoned in various parts of England, 198 were transported as slaves, and 338 died in prison or of wounds received in attacks upon their meetings. It was not until after the Revolution of 1688 that they were secure from serious molestation.

The increase in numbers made necessary some kind of organization. That adopted was almost wholly the work of Fox, and in its essential features is still preserved, as described below.

After the time of persecution came a lull in the history of the denomination, and more attention was given to internal affairs than to missionary effort. The 'discipline' was administered rigidly, and the number of members diminished greatly during the eighteenth and first half of the nineteenth centuries. Still, as in America, great attention was paid to philanthropic work. Later, foreign and home mission work was actively entered into, the loss in membership was checked, and a new spirit of earnestness, which still continues, pervaded the body.

The Quaker movement was not confined to England; it spread to Scotland, to Ireland, in some degree to the Continent, and in 1656 to America. In that year Ann Austin and Mary Fisher arrived in Massachusetts. They were cruelly treated, imprisoned, and then sent back to Barbados, whence they had come. Similar harsh treatment meted out to others, or even the execution on Boston Common (1659-61) of three men and one woman (see BOSTON; DYER, MARY), did not deter Friends from visiting America. In spite of persecution, converts were made and meetings established in nearly all the English colonies. George Fox himself traveled in America. 1671-72.

Notwithstanding their small numbers, the Friends exercised no little influence in Rhode Island, New Jersey, Virginia, and Maryland. Perhaps the most important incident in their history, whether in the Old or New World, was the settlement of Pennsylvania by William Penn in 1682, and the control of that Colony by the Friends for about seventy years. See PENNSYLVANIA.

Soon after the cessation of persecution the Friends withdrew from active aggressive movements and turned their attention to perfecting and administering their discipline; to the practice of philanthropy, notably to the extinction among their membership of the custom of holding

slaves, and to labors in the general anti-slavery cause, also to caring for the American Indians, improving the condition of prisoners, the insane, etc. The rigid application of the 'Discipline,' especially the 'disowning' (depriving of membership) of those who had married non-members, was one of the chief causes of a steady decline in membership which increased in extent as the years went on. The greatest blow to the Friends, however, was the 'separation of 1827-28.' This was a schism due to several causes. The immediate occasion was the preaching and teaching of Elias Hicks (q.v.), a prominent Friend. He promulgated doctrines closely approaching what are usually known as Unitarian views. He also made statements which seemed to undervalue the Holy Scriptures and their divine authority. More than one-half of the Friends in the Middle States followed Hicks, but they were largely in the minority as compared with the whole body of Friends. The larger party was reorganized by the London Yearly Meeting in England. The two divisions are often called 'Orthodox' and 'Hicksite,' and are so distinguished in the United States Census Reports. Neither name is strictly accurate. The smaller division prefer to be called the 'Liberal Branch.'

The effect of the schism upon the 'Orthodox' body was to bring about a movement in favor of a higher education, and a doctrinal belief more nearly allied to that of the so-called 'evangelical' bodies. The leader in this movement was Joseph John Gurney (q.v.), a highly educated and prominent Friend of Norwich, England. This new tendency, however, excited considerable opposition among some of the 'orthodox' Friends in America, which resulted in another separation. These separatists were called 'Wilburites' from John Wilbur, the leader of the movement. The points of difference did not concern the essentials of Christianity, but rather their practical application, and also points of discipline and methods of administration. This schism was not general, and the number of separatists was small.

There remains still another body called the 'Primitive Friends.' They may be described as ultra-Wilburite. They number less than 250 members.

The Friends in Great Britain and Ireland do not differ in any important respects from their brethren in America. Owing to the conscription laws which prevail on the Continent of Europe, it has been almost impossible for the Friends to maintain meetings there. In all, only about 250 members are found. In Australasia there are about 500, and there are a few in Turkey and in Asia.

DOCTRINE. It is perhaps more in the spirit than in the letter of their faith that the Friends differ from other orthodox Christians. This was so from the first. The epistle addressed by George Fox and other Friends to the Governor of Barbados, in 1671, contains a confession of faith not differing materially from the fundamental doctrines of evangelical bodies. The Friends have no formal creed or confession, and they have avoided the use of technical theological phraseology. Declarations of faith, however, have been issued from time to time, notably in 1693, 1829, and 1887. In all of these the position taken on essential points of doctrine is substantially the

same as that of the great bodies of Protestant Christianity.

Their most distinguishing doctrine is that of the immediate personal teaching of the Holy Spirit to the individual. This has often been called the 'Inner Light,' or the 'Christ Within.' This doctrine has often been misunderstood. Some of the early Friends themselves are not clear in their statements regarding it. George Fox unquestionably states the doctrine truly when he says, "I saw that the grace of God which brings salvation had appeared to all men, and that the manifestation of the Spirit was given to every man to profit withal." "The Lord opened to me," he says in another place, "how every man was enlightened by the divine light of Christ." Robert Barclay in the *Apology* taught that even the heathen were illumined by this light, though they might not know—as, indeed, those who lived before Christ *could* not know—the historical Jesus in whom Christians believe. In consequence of this view the Friends held that every one who lived up to the light which he had would be accepted of God. This fact, however, in no wise relieved the individual from the duty of seeking to obtain more light; neither did it relieve those who had the Gospel from the duty of carrying it to those who had it not. The early Friends were among the most active Protestant missionaries of their day. The doctrine of the direct manifestation of the Holy Spirit to the individual lies at the root of most of their special doctrines. It is the Holy Spirit who calls and qualifies for religious service, therefore all believers are 'priests unto God,' and there is no division into clergy and laity.

The Friends, at times, have been charged with undervaluing or at least neglecting the Holy Scriptures. At one time there was in certain places some foundation for this charge, but it arose from a misconception of the fact of divine guidance, and was contrary to the oft-repeated official declarations of the body and of its most respected leaders.

PRACTICE. It follows from the doctrine that the Holy Spirit calls and qualifies whom He will for religious service, that the Friends do not consider human learning a necessary qualification for the minister of the Gospel. They believe that the call to this work, now, as of old, is 'not of men, neither by man,' and that it is bestowed irrespectively of rank, talent, learning, or sex. Consequently they have no theological schools or professors of divinity. At the same time education is not undervalued, and provision is made in nearly all their colleges and higher schools for instruction in Church history, biblical languages, and allied subjects, but above all in the Bible itself. These courses are, however, not restricted to any class, but are open to all.

As fitness for the ministry is held to be a free gift of God through the Holy Spirit, so it ought to be freely bestowed upon others. But on the other hand, whenever ministers are engaged from home in the work of the ministry, they are, in the spirit of Christian love, freely entertained and have all their wants, including traveling expenses, supplied. Of recent years in some places and under some circumstances, a minister receives partial or even whole support: but neither by minister nor by congregation is the ministry

put upon a pecuniary basis, neither is it looked upon as a means of livelihood.

Their mode of conducting public worship likewise illustrates their dependence on the guidance of the Holy Spirit. The Friends meet and usually remain in silence until some one believes that he is called upon by the Spirit to speak in exhortation, praise, prayer, testimony, instruction, or the ministry. It follows from this that there may be several communications of different kinds in the same meeting, and the exercise may be from old or young, male or female, from those who are recorded ministers, or from those who are not.

Friends reject the ordinances of baptism and the eucharist as these are observed by other Christians. They believe that the true Christian baptism is a spiritual one, and not one with water. They believe that the true communion is inward and spiritual, and consists not in any symbolic breaking of bread and drinking of wine, but in that daily communion with Christ through the Holy Spirit, and through the obedience of faith, by which the believer is nourished and strengthened. They believe that Christ did not command *any* outward ordinance; that if the true spiritual baptism is experienced, and the true spiritual communion is partaken of, there is no need of any symbol. They believe, moreover, that the symbol tends to call attention away from the essential and beget a reliance upon the outward and non-essential.

The taking and administering of oaths is regarded by the Friends as inconsistent with the words of Christ, "swear not at all," and with the injunction of the Apostle James, "Above all things, my brethren, swear not, neither by heaven, neither by the earth, neither by any other oath; but let your yea be yea; and your nay, nay; lest ye fall into condemnation." They have also steadily refused to contribute to the support of a State Church.

The Friends have likewise consistently protested against war in all its forms; and they have repeatedly advised their members against in any way aiding or abetting military affairs. In support of this belief the Friends have at various times suffered much in person and property. They regard the profession of arms and fighting as diametrically opposed to the general spirit of Christ.

The Friends may certainly claim to have cultivated the moral sense of their fellow-countrymen in regard to the emancipation of the slaves and the abolition of the slave trade. As early as 1688 the Friends of Germantown, Pa., made a written protest against slavery. The feeling that slavery was wrong continued to grow; through the labors of John Woolman, Benjamin Lay, Anthony Benezet, and others the feeling became a conviction of the body, and by the close of the eighteenth century slavery was banished from the Friends.

DISCIPLINE. By the term 'discipline' the Friends understand "all those arrangements and regulations which are instituted for the civil and religious benefit of a Christian Church." The necessity for such discipline made itself felt soon after the rise of the body, and the result was the gradual establishment of certain meetings or assemblies. These are four in number: first, the *preparative* meetings; second, the *monthly* meetings; third, the *quarterly* meetings; and fourth,

the *yearly* meetings. Preparative meetings are wholly subordinate to the monthly meetings; they have little power; they attend exclusively to local matters, and where they exist must report to monthly meetings. The decided tendency in America is to give them up, and in the new General Discipline they are discontinued. The monthly meeting is the executive power, so far as the membership is concerned, subject to appeal to the quarterly and yearly meeting. It decides in cases of violation of the discipline, and has the power of cutting off or disowning all who by their improper conduct, false doctrine, or other errors, bring reproach on the body. The quarterly meetings are composed of several monthly meetings and exercise a general supervision over the latter, from which they receive reports, and to which they give such advice and decisions as they think right. The quarterly meetings send representatives to the yearly meeting. The term yearly meeting is used in two senses: first, the body of members who live within certain defined geographical limits; of this use mention will be made later on under the head Statistics; second, the annual assembly or conference, consisting primarily of representatives from the quarterly meetings; but every member has the right to take part in the deliberations and conclusions of the assembly. The function of the yearly meeting is to consider the condition of its membership in all its aspects. To it exclusively the legislative power belongs, and from its decisions there is no appeal. As its name implies, it is held but once a year, but in order that the interests of the body might not suffer between its sessions, a meeting was instituted first called the 'Meeting for Sufferings,' because its chief business was to take cognizance of the sufferings of Friends for conscience' sake; then, the 'Representative Meeting'; and still later the 'Permanent Board.' This body has stated times of assembling, but can, if necessary, be called together at short notice.

The officers of the organization are: first, *overscers*, appointed by each monthly meeting for a term of three years; they are two or more in number, usually equally divided between the sexes, and their duties are the oversight and watchful care of the membership; second, *elders*, two or more in number, of both sexes, appointed by monthly meetings with the approval of the quarterly meeting; they now usually hold office for three years; their chief duty is to exercise care over the ministry; third, *ministers*; as already implied, the Friends do not appoint ministers, but 'record' those upon whom they believe the gift is conferred through the Holy Spirit.

There is no doubt that a great change has come over the Friends. This is noticeable in externals rather than in doctrine. Any distinctive garb has been laid aside by almost all members; the use of the 'plain language'—'the thee and thou of the Quakers'—also, except familiarly among themselves, has been practically dropped; and the numerical names of the days and months are used only in official statements and among themselves. It is true some exception to these statements must be made more particularly in regard to the 'Wilburites' and the Friends in Philadelphia Yearly Meeting; but even in the latter the tendency is toward disuse. The discipline is administered in accordance with the spirit rather than the letter, and there is a general

falling away from formalism. In many of the meetings of the Middle West and West there are 'pastors' whose duty is pastoral visitation, and the care of the meetings for worship; where the whole time of the 'pastor' is given to such work a very moderate support is generally afforded, but this is an individual matter, and not a Church regulation.

The Friends are an active missionary body, and foreign missions are supported at various points in Madagascar, India, China, Japan, Africa, Mexico, Cuba, and Jamaica, and among the Indians of the United States and Alaska. There is an American Friends' Board of Foreign Missions, whose duty it is to have a general oversight, but not control, of the foreign missionary field. Great efforts have been made to bring about a closer union of the various yearly meetings, for they are now independent. This is shown by general conferences held at various times, and since 1887 every five years. From these conferences the plan of a regular meeting with defined powers to be held every five years has been adopted. This Five Years Meeting, as it is called, is composed of delegates from all the yearly meetings uniting in the plan; the first meeting was held in October, 1902, at Indianapolis, Ind. Besides this a 'Discipline' for all the American yearly meetings has been drawn up and has already been adopted by a majority, and probably will be adopted by all except one or two yearly meetings. This Discipline and the Five Years Meeting form the basis of a union which somewhat resembles that of the United States under the Articles of Confederation. It is too soon to forecast what the result of these efforts will be. All these remarks apply only to the 'Orthodox' body.

A pleasant feature of recent date is the 'Conference on Peace' which was held in Philadelphia in December, 1901. At this conference, for the first time since 1827, members of the different bodies who call themselves Friends met together on a common platform. Fewer changes are to be noted in the other bodies. The 'Hicksites' have not entered into the foreign mission field, but have been active in philanthropic efforts of various kinds, and the different yearly meetings have found a close bond of union in association for this philanthropic work.

The subject of education has claimed the earnest attention of both 'Orthodox' and 'Hicksite' bodies. The former, besides a number of boarding schools, have, for higher education, Haverford College, Haverford, Pa.; Guilford College, N. C.; Wilmington College, Wilmington, Ohio; Earlham College, Richmond, Ind.; Penn College, Oskaloosa, Iowa; Friends' University, Wichita, Kan.; Whittier College, Whittier, California; Pacific College, Newberg, Oregon. Bryn Mawr College for Women, Bryn Mawr, Pa., though controlled by Friends, is undenominational. The 'Hicksite' body has excellent schools, and Swarthmore College, for both sexes, at Swarthmore, Pa. During the past few years general summer schools for the study of religious history and biblical literature have been held at Haverford, Earlham, and Swarthmore Colleges, and elsewhere, besides other summer schools of more limited extent.

STATISTICS. The 'Orthodox' have 16 yearly meetings, viz.: London (for Great Britain), Dub-

lin, Canada, New England, New York, Philadelphia, Baltimore, North Carolina, Ohio, Wilmington (for southern Ohio and Tennessee), Indiana, Western (Indiana), Iowa, Kansas, California, and Oregon; there are also the small communities scattered throughout the world as already noted. The 'Hicksites' have seven yearly meetings: New York, Genesee (western New York), Philadelphia, Baltimore, Ohio, Indiana, and Illinois. The 'Wilburites' have six: New England, Canada, Ohio, Western (Indiana), Iowa, and Kansas. In 1901 the 'Orthodox' in America numbered 93,204 members; in Great Britain and Ireland, 19,955; elsewhere, 761; total, 113,920. The 'Hicksites' in 1890 had 21,992 members; the 'Wilburites' (1890), 4329, the 'Primitive' branch (1890), 232; total, for all bodies, 140,473.

FRIENDSHIP IN FASHION. A comedy by Thomas Otway, the first work by this playwright which was not in a measure an adaptation of some other drama. It was produced at Dorset Gardens in 1678, with Betterton and Mrs. Barry in the principal parts, and published in the same year with a dedication to the Earl of Dorset. It was well received, but being revived at Drury Lane in 1750, was, on account of its indecency, hissed, in spite of the presence of Mrs. Clive in the cast.

FRIENDS OF GOD (Ger. *Gottesfreunde*). A small body of religious reformers of mystical tendencies, which originated in the fourteenth century, and labored for the reformation of the Church and society, continuing their adherence to the former. The name was derived from John xv. 15. Tauler (q.v.), the great Dominican mystic of Strassburg, and Heinrich Suso (q.v.) were of the brotherhood, and Meister Eckhart (q.v.) sympathized with it, although probably not belonging to it. It also included many Dominican nuns. The brotherhood is heard of in Basel, Strassburg, and Cologne, but probably had members elsewhere. Sympathizing to some extent with the Brothers of the Free Spirit, they nevertheless avoided the fanaticism ascribed to that body. (See **BROTHERS AND SISTERS OF THE FREE SPIRIT**.) Consult Jundt, *Les amis de Dieu au quatorzième siècle* (Paris, 1879).

FRIENDS OF THE PEOPLE. An English society founded in 1792 by Sheridan and Grey

for the purpose of promoting Parliamentary reform. Among its members were Lord John Russell and Lord Edward Fitzgerald. It was opposed by Fox and Pitt. The reform bills brought forward by Grey in 1792, 1793, and 1797 received scarcely any support. In fact, during the struggle with Napoleon the times were not favorable to any constitutional change; and so the association languished, serving mainly as a school in which were trained the great leaders who forty years later saw its original purpose accomplished in the Reform Bill of 1832.

FRIENDS OF THE TEMPLE (Ger. *Tempelgesellschaft, Tempelverein, Jerusalemfreunde*). A German sect, called also the Temple Society, and Hoffmannites, who, accepting the Scriptures in full, expect the fulfillment of all the prophecies, and believe it the duty of Christ's disciples to labor to promote that end, as Christ Himself came to do. The first step is to gather the people of God in Palestine, and with this idea, spiritual communities called Temples are instituted in different countries, to assist in the construction of the Temple in the Holy Land. The society originated in Württemberg toward the middle of the nineteenth century, under the lead of the Rev. Christopher Hoffmann. In 1868 a colony was established at Jaffa, the following year one at Haifa, and two others have been added, one at Saron, near Jaffa, and one at Jerusalem. These colonies number about 1200 members, are prosperous, and have done much for the improvement of the country. The doctrines of the Friends of the Temple have not been formulated into a creed. The spiritual development of the members is a matter to which careful attention is given. The rite of baptism and the Lord's Supper are observed, but are not under definite regulation, individual convictions being allowed to prevail in the choice of the method. Consult: Hoffmann, *Occident und Orient* (Stuttgart, 1875), and *Mein Weg nach Jerusalem* (ib., 1881-85).

FRIES, frès, ADRIAEN DE. See **VRIES**.

FRIES, BERNHARD (1820-79). A German landscape painter, born at Heidelberg. He studied at Karlsruhe, and at Munich under Cornelius; traveled in France and Austria, and remained eight years in Italy. His best works are the forty Italian views now at Munich. They are well conceived and carefully painted. His brother ERNST (1801-33) was born at Heidelberg. He was a pupil of K. Kuntz at Karlsruhe, and afterwards studied in Munich and in Italy. Despite his short life, Fries left some excellent pictures, such as "A View of Tivoli," "Sorrento and the House of Tasso," "The Waterfall of Liris at Isola di Sora," "The Castle of Massa," and "A View of Heidelberg." The works show a sincere feeling for nature.

FRIES, ELIAS MAGNUS (1794-1878). An eminent Swedish botanist. He was born in the parish of Femsjö, and studied at the University of Lund, where he became demonstrator in botany in 1828. In 1834 he went to the University of Upsala as professor of economic science, to which chair, after the death of Professor Wahlenberg, in 1851, was united the chair of botany. In the latter year he was also appointed director of the Upsala Botanic Garden, and in 1859 he retired from active work. Fries made important contribu-

tions to all departments of systematic botany, but especially to the knowledge of lichens, fungi, and mosses, upon which groups of plants he wrote many important works. Some of his publications are: *Systema Mycologicum* (3 vols., 1820-32); *Elenchus Fungorum* (2 vols., 1825); *Lichenographia Europæa Reformata* (1831); *Flora Scanica* (1835); *Sind die Naturwissenschaften ein Bildungsmittel?* (1844); *Summa Vegetabilium Scandinaviæ* (2 vols., 1846-49); *Novæ Symbolæ Mycologicæ* (1851); *Monographia Hymenomycetum Suecicæ* (2 vols., 1857-63); *Epicrisis Generum Hieraciorum* (1862); *Sveriges ätliga och giftiga svampar, Fungi Esculenti et venenati Scandinaviæ* (1862-69), with 93 colored plates; *Botaniska utflygter*, three volumes of collected short papers (1843-64).

FRIES, JAKOB FRIEDRICH (1773-1843). A German philosopher, born at Barby, Saxony. He studied there and in the universities of Leipzig and Jena, and became a lecturer in philosophy at the latter in 1801. From 1805 to 1816 he was professor of philosophy and elementary mathematics at Heidelberg, and from 1816 until his death professor of theoretical philosophy at Jena. His chief work is the *Neue Kritik der Vernunft* (3 vols., 1807), an attempt to find a new basis for the critical philosophy of Kant. His method is psychological. He holds that a knowledge of the *a priori* cognition of Kant is to be attained only by the *a posteriori* process of subjective experience. Hence, the *a priori* element, inasmuch as it is discoverable only by subjective experience, is not, as Kant contends, transcendental to all experience. Therefore, philosophy finds its ultimate foundation in subjective knowledge, and its true exposition through psychological analysis. Other differences from the Kantian teaching are also encountered in Fries, whose work, though ingenious, may be said to contribute little to the progress of speculation.

FRIES, JOHN (c.1764-1825). The leader of the so-called 'Fries Rebellion' in Pennsylvania in 1799. He was the son of a Pennsylvania farmer, and was successively a cooper's apprentice, a soldier (during the Whisky Insurrection), and an auctioneer. In July, 1798, Congress voted a direct tax of \$2,000,000, \$237,000 of which was fixed upon, in January, 1799, as Pennsylvania's quota. Soon afterwards Federal officers began to make the assessments. In Pennsylvania the tax fell chiefly on houses and lands, the value of the former being determined by the number and size of the windows. Among the Germans in the counties of Montgomery, Lehigh, Bucks, and Berks, a regular opposition, under the leadership of Fries, was organized to the assessment of this 'window tax.' This led to open conflict with the Federal officers, and at Bethlehem, on March 7th, a considerable force of disaffected farmers under Fries compelled the United States marshal to liberate thirty prisoners who had been arrested for opposing the law. Finally the militia was called out by President Adams, and many of the rioters, including Fries, were captured and taken to Philadelphia. Here Fries was twice tried for treason, and was each time found guilty and sentenced to death, but was eventually (April, 1800) pardoned by President Adams, who, at about the same time, issued a general amnesty

to all who had been concerned in the uprising. Afterwards Fries settled in Philadelphia, and acquired a considerable fortune in the tinware trade. Consult Davis, *The Fries Rebellion* (Doylestown, Pa., 1899); and, for an account of the trial, *Das erste und zweite Verhör von John Fries* (Allentown, Pa., 1839).

FRIESE, RICHARD (1854-). A German animal and landscape painter, born at Gumbinnen, East Prussia. He studied at the Academy in Berlin, where, after traveling in the East, in Norway, and as far as the polar regions, he rapidly acquired his present reputation as one of the best animal painters in Germany, especially noted for his vivid delineations of the lion's life in the desert, and also of the native deer world in the German forest. The distinctive conception and tone of the landscape portion in his pictures deserve especial comment. He was awarded a gold medal in 1886, and elected a member of the Berlin Academy in 1892. His most noteworthy productions include: "Lions Surprising Caravan's Camp" (1884), Dresden Gallery; "Elks on Field of Battle" (1890), National Gallery, Berlin; and "In the Bredszell Moor" (1895), Königsberg Museum.

FRIESEN, frēzen, HERMANN, Baron (1802-82). A German Shakespearean scholar. He was educated at Leipzig and Göttingen, and occupied several positions at the Court of Saxony. He became known for his *Briefe über Shakespeares Hamlet* (1864), and *Shakespeare-Studien* (1874-76). He also made valuable contributions to the *Jahrbuch* of the German Shakespeare Society.

FRIESEN, KARL FRIEDRICH (1785-1814). A German patriot, and one of the principal promoters of gymnastics in Germany. He was born at Magdeburg. He studied at the Academy of Architecture, Berlin, collaborated on the great atlas of Mexico edited by Humboldt, and from 1810 was an instructor in the Plamann Institute. In 1810-12 he rendered important services to Jahn in the establishment of German gymnastics. Upon the outbreak of the German War of Liberation, in 1813, he assisted in organizing the famous volunteer corps of Major von Lützow, whose adjutant he became. After the dispersion of the corps by Napoleon at Rheims, he was captured and shot by the French at La Lobbe, Ardennes, March 15, 1814. In 1843 his body was buried with solemnity in the military cemetery at Berlin. He has frequently been celebrated by German writers, in particular by E. M. Arndt in "Es thront am Elbebrande." Consult Schiele, *Friedrich Friesen Eine Lebensbeschreibung* (Berlin, 1875).

FRIESEN, RICHARD, Freiherr von (1808-84). A statesman of Saxony. He was born at Thürmsdorf, Saxony, was educated at Göttingen and Leipzig, entered the civil service of Saxony, and rose to be Minister of the Interior from 1849 to 1852. In 1858 he became Minister of Finance, and in 1867 of Foreign Affairs also. He was appointed in 1870 a commissioner to arrange in Versailles with the South German States treaties looking to the unification of Germany. From 1871 until his retirement in 1876 he was president of the Ministry. Consult his *Erinnerungen aus meinem Leben* (Dresden, 1880).

FRIESIAN, or **HOLSTEIN-FRIESIAN CATTLE**. See **DAIRY CATTLE**, under **CATTLE**.

FRIESLAND, or **VRIESLAND**, frēz'land (Lat. *Frisia*). A northwestern province of the Netherlands, bounded by the North Sea, Zuyder-Zee, and the provinces of Groningen, Drenthe, and Overijssel (Map: Netherlands, D 1). Area, 1282 square miles. The land is flat, and in some parts below the level of the sea, against the incursions of which it is protected by numerous dikes and sluices. Streams are few, but there are numerous canals and lakes abounding in fish. About 60 per cent. of the area being composed of meadows and heath, Friesland is better adapted to pastoral than purely agricultural industries. It breeds excellent horses and other domestic animals, which, with dairy products, are the chief exports. The manufacturing industries are comparatively insignificant. The capital is Leeuwarden (q.v.). The West Frisian Islands form a part of the province. Population, in 1899, 340,262.

FRIETCH'IE, BARBARA. See **BARBARA FRIETCHIE**.

FRIEZE (OF. *frise*, *frize*, Fr. *frise*, Olt. *frigio*, *friso*, *fregio*, It. *fregio*; probably from ML. *phrygium*, *fristum*, embroidered work, from Lat. *Phrygius*, Gk. *Φρύγιος*, *Phrygius*, Phrygian, from *Φρυξ*, *Phryx*, Phrygian; otherwise connected with OF. *friser*, *frizer*, Fr. *friser*, OFries. *frisle*, *fresle*, hair of the head). In classical architecture, the central division of the entablature (q.v.). In the Doric style the frieze is cut into sections by triglyphs (q.v.), the interspaces being called metopes (q.v.). In other orders the frieze is continuous and usually plain, being ornamented only in the Roman period and in the Corinthian order by a scroll-work decoration. It is also called (by Vitruvius) the zophorus, from its being frequently ornamented with sculpture. From the same cause the term frieze is sometimes applied to any enriched horizontal band in any style of architecture.

It is then not necessarily a part of an entablature, and the enrichment may be that of painting, mosaic, carving, inlay, or any other form of decoration. Richly sculptured friezes are those of the Choragic monument of Lysicrates, the mausoleum of Halicarnassus, the Xanthus tomb, the Treasury building at Delphi, the temple of Nike Apteros at Athens, that of the temple of Apollo at Phigaleia, of the Pergamon altar, and the temple; but the masterpiece of all Greek friezes is that of the Parthenon.

FRIEZE, HENRY SIMMONS (1817-89). An American scholar and writer. He was born in Boston, Mass., September 15, 1817. After 1830 he became a clerk and organizer. He was graduated at Brown University in 1841, and until 1845 was instructor in the university. From 1845 to 1854 he was instructor in the grammar school of the university. He then left Brown to accept the professorship of Latin at the University of Michigan, a position which he held until his death, in December, 1889. From 1869 to 1871 he was acting president of the university, during which period most of the academic privileges were thrown open to women. Frieze devised a system of inspection which established an official connection between the university and the high schools of the State. In the year 1880-81 he was again acting president. The degree of LL.D.

was conferred upon him by Chicago University and Kalamazoo College in 1870, by Brown in 1882, and the University of Michigan, 1885. He edited Vergil's *Æneid* and books x. and xii. of the *Institutes* of Quintilian, delivered and published addresses on *Ancient and Modern Education* and *Art Museums*, and presented valuable reports to the Michigan State Board of Regents. His last work was *The Story of Giovanni Dupré* (1886).

FRIGATE (from OF. *fregate*; possibly from Lat. *fabricata*, sc. *navis*, ship, p.p. of *fabricari*, to build, from *fabrica*, workshop, from *faber*, artisan). A war-ship of a type which has not been built for more than half a century. The term was used in the Mediterranean in the fourteenth and fifteenth centuries—and perhaps for many centuries before—to designate a narrow, fast-sailing vessel, fitted also to be propelled by oars, and having holes in the sides for the passage of the latter resembling gun-ports. These vessels were small, and were used for ordinary purposes of traffic and not for war. Their shape and speed caused the model to be followed for larger craft adapted for heavy weather in the open sea. In the sixteenth century the term was very generally applied to merchant ships in all the countries of Western Europe. Toward the close of the century certain of these merchant frigates were hired for service in the English Navy; but they appear to have been quite small craft. The first frigate built in England was the *Constant Warwick*, built at Ratcliffe by Peter Pett the elder, as a privateer for the Earl of Warwick, and afterwards purchased by the Government. The model was taken from a French frigate, according to the Earl's son; but Pett, or his friends, claimed that he was the inventor of the frigate. The *Constant Warwick* carried 26 guns as a privateer; but the battery was gradually increased to 42 guns in 1677. The distinguishing characteristics of frigates grew to be speed and handiness combined with moderate size. The type began to crystallize during the seventeenth century, and soon after the middle of the eighteenth it was well established. Frigates were then rated as forty-fours, thirty-eights, thirty-sixes, thirty-twos, twenty-eights, and twenty-fours, according to the number of guns carried. Ships carrying less than 32 guns were rarely frigate-built, and it was common for frigates to carry several guns more than implied in their rating, particularly after the introduction of carronades (q.v.). At the beginning of the nineteenth century a frigate was a vessel carrying guns on one covered deck and on an uncovered deck above this. If these were all long guns the gun-deck (lower) battery consisted of 26 to 32 long 18-pounders or 12-pounders, and the spar-deck battery of six to twelve 6, 9, or 12 pounders. The rig was that of a ship, three masts, square-rigged on all. The tonnage—a rather uncertain measure of size—of the British frigates varied between 500 and 1200; some of the United States Navy were larger. (See **CONSTITUTION**; also, section on Navy, in article **UNITED STATES**.) After the application of steam to war-vessels, the term frigate steadily lost significance, and is now no longer used, except in some European navies, where *captain of frigate* is a title of rank of naval officers answering to that of commander in the United States Navy.

FRIGATE-BIRD (so called from their attacks on other sea-birds), or **MAN-OF-WAR HAWK**. A sea-bird (*Fregata aquila*) of the order *Steganopodes*, related to the pelicans, and hence sometimes called 'frigate pelican.' It is a large bird with black plumage, sometimes measuring 10 feet from tip to tip of its extended wings, and is capable of very powerful and rapid flight. It

FRIGATE-BIRDS.

In the foreground is a male with distended pouch.

inhabits the intertropical coasts, both of the Atlantic and Pacific oceans, often flying out far to sea, but most of the time remaining near shore. Its aerial evolutions are extremely graceful, and it soars to a great elevation. It is said never to dive for its prey, but to seize fishes only when they appear at the surface or above it, and flying fishes constitute no small part of its food. It also pursues gulls and terns, and eats the fish which it forces them to disgorge. The feet are very small, but the bill is five inches long and strongly hooked at the tip. A closely allied species (*Fregata minor*) is found in the Pacific and Indian oceans, and the two comprise the whole genus, which is the only one in the family *Fregatidae*. These birds breed in companies on the ledges of sea-cliffs, on trees near shore, or on the ground of oceanic islets, making a very rude nest and laying a single white egg. In the breeding season the gular pouch of the male becomes a vivid scarlet and is greatly distended, so that these birds form very striking objects as they roost upon the ground or wheel about in the throng of the colonies. The interior of the pouch is in communication with the air-sacs of the neck, and is filled or emptied (slowly) through the bronchi. When full it is a semi-transparent balloon, and reaches forward as far as the end of the beak, and downward so as to completely hide the breast. When empty it retracts to invisibility between the rami of the lower mandible.

Forbes, *Wanderings in the Eastern Archipelago* (New York, 1885); Leiter, account of nesting of frigate-birds on Phenix Island, South Pacific Ocean, in *Proceedings of the Zoological Society of London* (London, 1891). See **TROPIC-BIRD**, and also **PLATE OF FISHING BIRDS**.

FRIGATE MACKEREL. A species of mackerel (*Auzis thazard*) abounding in all warm seas, sometimes in immense schools, but of little value. See **MACKEREL**.

FRIGGA, frig'a. See **FREYJA** AND **FRIGGA**.

FRILL-BACK. A domestic pigeon of an East Indian breed, whose feathers are wholly turned forward. The beak is very short.

FRILLED LIZARD. A large agamoid lizard (*Chalmydosaurus Kingii*) of the tropical parts of Australia, remarkable for its erectile ruff and for its running on two legs only. Its habits are sylvan, and its chief resort is the trunk or lower limbs of a tree. It subsists on beetles almost exclusively, all captured alive and in daylight. At night it rests clinging to the bark in an upright position. Its ordinary attitude is with the hind legs spread and flexed, letting the vent and tail rest upon the ground, while the fore part of the body, with the head uplifted, is supported high upon the stiffened forearms. When this lizard runs, however, it holds the fore part of the body clear of the ground and goes upon the hind legs alone, after the manner of a bird. This feature, and its bearing upon the animal's ancient avine and lacertilian relationships, are discussed by Professor Saville-Kent in the *Proceedings of the Zoological Society of London* for 1895, pp. 712 to 717. The same specialist describes, from a study of captive examples, the skin membrane about the neck as a denticulated frill, which in old lizards may measure eight or

A FRILLED LIZARD, RUNNING.

nine inches in diameter. It may be erected or depressed at will; but as slender processes of the hyoid bone extend into it, the membrane cannot be expanded unless the mouth is open, nor can the opening of the jaws fail to lift the bill, which is otherwise folded inconspicuously upon the neck. (See **LIZARD**.) It is dun-colored on the outside, like the rest of the body; but its inside, brought to view when erected, is brilliant with red and yellow mottlings, as also are the parts of the head otherwise concealed. Its function, evidently, is to act as a 'scare' organ. The sudden expansion of this gaudy disk in the face of an enemy, with the wide-open, sharply hissing mouth in the centre, followed, as a rule, by an instantaneous rush forward, is calculated to terrify the foe completely. In addition to this harmless demonstration, the long, whip-like tail is vigorously lashed from side to side, and able to inflict sharp blows likely to be both disconcerting and painful. Compare **JEW LIZARD**, and consult Saville-Kent, *The Naturalist in Australia* (London, 1897).

FRIMAIRE, frémâr' (Fr., sleety). The third month in the French Republican Calendar of 1793. It began on November 21st in years 1 to 3 and 5 to 7; on November 22d in years 4, 8 to 11, 13 and 14; and on November 23d in year 12.

FRIMONT, frémôn', JOHANN MARIA, Count, Prince of Androdoco (1759-1831). An Austrian general, born at Finstingen, Lorraine. He studied at the Collège at Pont-à-Mousson, entered the Austrian Army in 1776, fought against Napoleon, and by 1812 was commanding a cavalry division under Prince Schwarzenberg. In 1815, with the rank of general of cavalry, he was in command of the Austrian forces in Northern Italy, and subsequently of the army of occupation. He was appointed in 1821 to the chief command of the army sent to restore order at Naples and suppress the Carbonari. On March 24th he entered the city in triumph. In 1831 he became president of the Council of War.

FRINGES (dialectic Fr. *frinche*, ML. *fringia*, OF. Fr. *frange*; probably from Lat. *fibria*, border, fringe). In optics, the alternate bands of light and dark, due to the interference of waves of light, which are produced when a beam passes the sharp edge of a screen, or is transmitted through a narrow slit or hole, or bi-prism, or by reflection from a Fresnel mirror, are called fringes. See DIFFRACTION; INTERFERENCE; LIGHT.

FRINGE-TREE.

FRINGES. In the English Bible, the translation of the Hebrew *gedilim* in Deut. xxii. 12, and of *sisith* in Num. xv. 38. The marginal reading of the Revised Version, 'twisted threads' and 'tassels,' is probably better. In the passage in Deuteronomy the Hebrews are commanded to place fringes upon the four corners of their robes; in Numbers, in a later passage, the description is more detailed, and the reason is assigned "to remember all the commandments of the Lord." The injunction was much elaborated by the rabbis, and made a matter of the first importance in Judaism (cf. Matt. xxiii. 5). Originally the garment to which the fringes were attached was the outer one; passages in the Gospels in which it is stated that the healing power of Jesus was experienced if the hem or border of His garment were touched doubtless refer to the fringes or tassel (Matt. ix. 20; xiv. 36; Mark vi. 56; Luke viii. 44). In the course of time, because of persecution, the fringes came to be concealed, and are now put by orthodox Jews on a separate garment worn under the outer, reaching only to the chest, and called the smaller *tallith*, to distinguish it from the larger *tallith*, which also has fringes and is worn only during the recital of the prayers. In form it is a modern survival of the ancient dress of the Jews. The wearing of fringes is doubtless based on some ancient custom of a religious character; possibly they were regarded as amulets. Consult: Robertson Smith, *Religion of the Semites* (London, 1894); Nowack, *Hebräische Archäologie* (Freiburg, 1894).

FRINGE-TREE (*Chionanthus*). A genus of plants of the order Oleaceæ, consisting of small trees or large shrubs, natives of America and China. The common fringe-tree, or snowflower (*Chionanthus virginica*), is found in the United States from Pennsylvania and Delaware to the Gulf of Mexico, and west to Texas. It sometimes attains the height of 20 or 30 feet, but is rarely

more than 8 or 10 feet high; has opposite oval leaves 6 or 7 inches long, and very numerous snow-white flowers in panicle racemes. The

limb of the corolla is divided into four, sometimes five or six, linear segments an inch or more long, whence the name fringe-tree. The fruit is an oval drupe. The tree is frequently cultivated as an ornamental plant.

FRINGILLIDÆ (Neo-Lat. nom. pl., from Lat. *fringilla*, a sort of small bird, probably the chaffinch). A family of typical passerine birds, having a conical or nearly conical bill, sometimes short and thick, sometimes comparatively slender and elongated, sometimes convex above, below, or at the sides, the commissure—line of junction of the mandibles—straight. The neck is short, and neither the tail nor the wings are long. The Fringillidæ are all small birds, and feed chiefly on seeds, but to some extent also on insects. The family is an extremely numerous one, and is distributed over all parts of the world. It is represented in America by finches, sparrows, grosbeaks, crossbills, etc., elsewhere described, and has by some systemists been placed at the head of the list of all birds, being regarded as the most highly organized group. (See FINCH.) Typical forms are illustrated in the plates FAMILIAR SPARROWS; BUNTINGS AND GROSBEAKS; CAGE-BIRDS.

FRISCH, frish, JOHANN LEONHARD (1666-1743). A German philologist and lexicographer, born at Sulzbach. He studied at Altdorf, Jena, and Strassburg, was for a short time a pastor at Neusohl, Hungary, and after extensive travels settled at Berlin, where in 1727 he was appointed rector of the Gymnasium zum Grauen Kloster. In 1706 he became a member of the Royal Scientific Society, and in 1731 director of the historical-philological division. Best known and most important of his works is the *Deutsch-lateinisches Wörterbuch* (1741), the result of thirty years' labor, and the first to be prepared on scientific principles.

FRISCHES HAFF, frish'ez häf (LG., Fresh-water Bay). A large lagoon on the northern coast of Prussia, southeast of the Gulf of Danzig (Map: Prussia, H 1). It is rather less than 60 miles in length from northeast to southwest, with a breadth which varies from 2 miles to 18 miles, and an area of 330 square miles. It has a depth of from 10 to 16 feet, and was once entirely walled off from the Baltic by the Frische Nehrung, a narrow spit of land extending for about 40 miles along its northern shore. In 1510, however, the waters of the Frisches Haff broke over the Frische Nehrung, and formed the passage called the Gatt, which unites the lagoon with the Baltic. The Gatt is only from 10 to 15 feet in depth. All large vessels load and unload at Pillau, which is situated at the mouth of the Gatt, on the shore of Danzig Bay. Cargoes are conveyed to and from the ports on the Frisches Haff by means of lighters. The lagoon receives the waters of the Nogat, Pregel, Frisching, and Passarge and part of the waters of the Vistula.

FRISCHLIN, frish'lën, NIKODEMUS (1547-90). A German philologist and Latin poet, born at Balingen, Württemberg. He studied at the University of Tübingen, and became professor of history and poetry there in 1568. Through the jealousy of his colleagues and the hatred of the nobility, whom he had angered by his satiric wit, he was compelled to relinquish his chair, and in 1582 became rector of the school at Laibach in Carniola. From 1584 to 1587 he was again at Tübingen, but in 1588 became rector of a school at Brunswick. Expelled thence in 1589, as the result of a pasquinade, he wandered about for a time, and finally was imprisoned in 1590 in the Hohenurach Dungeon at Mainz. He broke his neck in an attempt to escape. He wrote in Latin some indifferent tragedies; a few comedies, of which the best is *Julius Cæsar Redivivus* (1584); and poems, including principally *De Natali Jesu Christi*, and the *Hebræis*, a hexametric chronicle of the Jewish kings. His philological study is best represented by the *Grammatica Latina* (1585). Consult Strauss, *Leben und Schriften des Dichters und Philologen Frischlin* (Frankfort, 1856).

FRIS'CO. A popular abbreviation of the name San Francisco.

FRISI, frē'zē, PAOLO (1728-84). An Italian mathematician. He was born at Milan, taught philosophy at Padua, and became, in 1756, professor of mathematics at Pisa, and in 1764 at Milan. When less than twenty-three years of age he published a remarkable *Disquisitio Mathematica* (1751), upon the physical causes which have determined the magnitude and shape of the earth. He also published: *De Atmosphæra Cælestium Corporum* (1758); *De Inæqualitate Motus Planetarum* (1760); and *Del modo di regolare i fiumi e i torrenti* (1762).

FRISIAN LANGUAGE AND LITERATURE (OFris. *Frise*, *Frese*, AS. *Frisa*, ML. *Friso*, Lat. *Frīsii*; possibly connected with OFris. *frāse*, danger, AS. *frāsan*, Goth. *fraisan*, OHG. *fraisōn*, to test). The language and literature of a branch of the Germanic family of dialects which was formerly spoken along the coast of the North Sea and on the coast islands from the Rhine to the Ems. The Frisians are first mentioned by Tacitus, who divides them into the

greater and the lesser. Their boundaries varied at different periods, however, so that the entire coast-line from the Scheldt to the Weser has at one time or another been occupied by those who spoke the Frisian language. Of all the Germanic dialects this is the one nearest akin to Anglo-Saxon, so that the two tongues are sometimes classed together as Anglo-Saxon Frisian. Thus we have Anglo-Saxon *mōna*, Old Frisian *mōna*, moon, but Old High German *māno*, Gothic *mēna*, or Anglo-Saxon *æcer*, Old Frisian *ekker*, field, acre, but Old High German *achar*, Gothic *akrs*. On the other hand, Frisian has many points of association with Dutch and Icelandic, which are not found in Anglo-Saxon, as *of*, or, *wēr*, true, while the Icelandic and Anglo-Saxon have the so-called 'breaking' of the vowels before *r*, *l* + consonants which does not occur in Frisian, e.g. Anglo-Saxon *beorh*, Icelandic *biarg*, hill, but Old Frisian, Old High German *berg*. It seems probable, on the whole, that the Anglo-Saxons once occupied the land between the Frisians and the Scandinavians, and that of the Anglo-Saxon dialects the Kentish stood nearest the Frisian (e.g. Old East Frisian *biade*, he commanded, Kentish *biade*, but West Saxon *bēode*), while next to the Kentish in this respect came the West Saxon, and finally the Northumbrian and Mercian.

Frisian is divided into numerous dialects, many of which now differ from each other to a surprising degree. Indeed, so divergent are many words in the vocabularies of the various dialects, that some of the commonest terms become unintelligible after a very short distance. It is furthermore necessary to bear in mind the strong influence exercised by Danish over the vocabularies of many dialects. By a phenomenon, somewhat unusual in language, many terms for the most familiar objects are loan-words in Frisian, being borrowed from the Danes.

Frisian may be divided first into East and West Frisian, and the former of these again into East and North Frisian. The East Frisian, using the term in this restricted sense, is subdivided into the Weser and the Ems dialects. This group has been gradually supplanted by Low German (Plattdeutsch), so that what is now often called East Frisian is, in reality, a Low German dialect. In 1890 thirty-two persons on the island of Wangeroog, and about 2000 in the Saterland of Oldenburg still spoke East Frisian. The North Frisian group, which formed the vernacular of about 2600 persons in 1885, is divided into seven dialects on the mainland and three on the islands. The dialects of the coast have been strongly influenced, not only by Low German, but also by Danish, and island dialects seem to show in addition the presence of West Saxon elements. Of Old North Frisian hardly any records exist, the oldest being a short inscription on a font of 1452 at Pelworm. Old West Frisian, on the other hand, is represented by literary remains which are relatively extensive, while the New West Frisian is that in which the bulk of modern Frisian literature is composed. The dialects of New West Frisian are not separated by such wide divergencies as the East and North groups, although they number six, since the majority of the differences are due to the operation of analogy (q.v.).

The Frisian employs the Roman alphabet, but uses *u*, *v*, and *w*, as well as *c* and *k*, almost in-

discriminately. The vowels have the Italian values, and the consonants are pronounced in general as in German, excepting that *s* is soft like the English *z*, and that *k* or *c* is frequently palatalized before *e* and *i* to *ch* or *sh* (written *sz*, *sth*, *ts*, *tz*, *tez*, or, in West Frisian, simply *s*, *z*). There is a tendency to elide *r* and *l* (*dega* beside *degar*, days; Modern Frisian *woed*, *woe*, Anglo-Saxon *woelde*, English *would*). The guttural *g* is often vocalized to *ï* (*jeld* for *geld*, payment; cf. Anglo-Saxon *geard*, English *yard*). The old pronunciation of *th*, as in English *thorn*, is still retained in some of the island dialects (West Frisian *thank*, thanks, but North Frisian *tônk*). The sound of *h* was extremely weak. The morphology of Frisian is essentially Germanic in its type. In nouns there are the three genders, two numbers, five cases, and the division into strong and weak declensions. Even in modern North Frisian the pronoun retains the dual (*wat* and *jat*, cf. Anglo-Saxon *wit* and *git*), which has been lost in all other modern Germanic languages. The verbs are strong, weak, and preterite-present, forming their past tenses, as in the other dialects of this group, either by ablaut (q.v.), or by composition with the verb signifying *to do* (e.g. Frisian infinitive *finda*, to find, preterite singular *fand*, preterite plural *fundon*, past participle *funden*, Anglo-Saxon *findan*, *fand*, *fundon*, *funden*; Frisian *hatia*, to hate, preterite *hatade*, *hatadon*, past participle *hatad*; Anglo-Saxon *hatian*, *hatade*, *hatadon*, *gehatad*; Frisian *môta*, to be obliged, present singular *môt*, present plural *môton*, preterite *môste*, Anglo-Saxon *môtan*, *môt*, *môton*, *môste*). The passive is formed like the Germanic passive generally, except in Gothic and the Scandinavian dialects, by *wesa* (Anglo-Saxon *icesan*), to be, with the past participle (e.g. Frisian *ik was funden*, Anglo-Saxon *ic wæs funden*, I was found). The syntax of Frisian follows the general type of the older Germanic languages.

FRISIAN LITERATURE. Frisian literature is, relatively speaking, extremely scanty. The oldest specimens of Frisian date no further back than the thirteenth century, although it may be shown by references to the ancient Latin chronicles that here, too, the Germanic epics had flourished at least five centuries before. These ancient epics were doubtless alliterative like the Anglo-Saxon and Icelandic poems, but beside the alliteration might be found now and then rhymed verse, as we find it for instance in Old High German in Otfrid's *Evangelienbuch*. As an example of such a verse, which also shows a trace of the older alliteration, we may quote

hē stifte and stērde treuwe und wērde

(he founded and strengthened fidelity and worth). Of this class of literature the most noteworthy is the so-called Privilege of Charlemagne, which purports to confer certain political rights on the Frisians. The production is, however, a forgery of the thirteenth century. It is written in rhythmic prose. The Rudolf-book, claiming to belong to the twelfth century, but probably written two centuries later, is a legendary account of the laws given by one Rudolf to the Frisians, who had been summoned to contribute a levy of troops for service against the Northmen. There is also a collection of 1671 verses edited under the title *Thet freske rym*, which is a translation of Low German verses, and

composed in a barbarous mixture of dialects which renders it practically useless for the study of the language. The prose literature is much more extensive and important. It begins about the eleventh century with an interlinear translation of the Psalms and with a late Chronicle. The remainder of the prose is devoted to legal topics. These law-books fall into two sections, general and local. To the general codes belong, among others, the seventeen *Keren* (petitions) and the twenty-four *Lôndriuchta* (land-rights). These were originally written in Latin and later translated into the various Frisian dialects. Besides some additions to the *Keren*, there is also the code of Upstalbôm, dating from 1323. Among the local law-books by far the most important class is formed by the Prologues and Tractates. The Prologues, as the name implies, are introductions to the codes proper, and deal with the history of the land or the dynasty, or treat of the theory and nature of law. Old sagas, too, are found in some Prologues, such as the saga of Karl and Redbad, or that of Magnus. More miscellaneous topics contained in them are descriptions of the Day of Judgment, the Creation, the grades of the priesthood, and the like. The Tractates themselves contain the legal codes. Tax-lists, formulas for taking the oath, letters, and synodical epistles (*sinuthriuchta*) are also found in the prose literature of Old Frisian.

The modern Frisian literature dates from the sixteenth century. Poetry is dead in East Friesland. In 1632 Imel Agena, of Uppant, composed a trivial poem in Alexandrines, which seems to have been a portion of a dance song. In North Friesland poetry was little better developed, although there are a few verses preserved, as well as a number of sagas current on the islands. The only important piece of North Frisian literature is J. P. Hansen's comedy *Di Gidtskals of di Sôlring Pid'ersdei* (Flensburg, 1809; 2d ed. with the addition of a story, *Di leddelk Stjûрман*, and some poems, Sonderburg, 1833). The most important of the modern Frisian literatures is the West Frisian, which has a continuous line from the sixteenth century to the present time. Between the old and new periods of this dialect there is, therefore, almost no gap, for the last example of Old West Frisian is a law of 1559, and the first specimen of the New is a comic dialogue of 1609, *Een tsamensprekinghe van tucce boersche Personen, Wouter en Tialle*. Early in the seventeenth century arose one of the greatest names in Frisian literature, that of Gysbert Japiks (1603-66). He was a true poet, turning especially toward peasant life, rich, too, in love poetry, and in the dialogue with which the modern period had begun. He was influenced by Dutch and classical models, but was, nevertheless, unaffected and unpedantic. In his last years, however, he lost his early simplicity. His imitator, Jan Althuysen (1715-63), like Japiks, made a translation of fifty-two Psalms and composed in addition many occasional poems. From the time of Althuysen till the present, no great literary name has arisen among the Frisians. Many brief poems, epithalamia, and the like, have been written, but only comedy deserves any special mention. Full of wit, and turning on the difference between the country and city, these plays portray excellently the peasant life. Most

noteworthy are Eelke Meinderts's *It libben fen Aagtje Iysbrants, of dy frieske boerinne* (1779); *De tankbrê boerzoon* (1778); *De reys fen Maicke Jukkelis* (1778); and *Het jonge lieues boosh* (1780).

Of the later Frisian writers, the most noteworthy are the Halbertsma brothers, Joost Hiddes (1782-1869), and Eeltje (1797-1858). The latter was a poet of talent, as is evident from his *Lapekoer fen Gabe Seroar* (1822), and his *Rimen en Teltsjes* (1868). Among other poets may be mentioned P. C. Salverda (*Ijljycke frieske Rymckes*, 1824); Rinse Posthumus, who wrote *Prieuwecke fen friesche Rymmelerije* (1824), and translated several of Shakespeare's plays, such as *Julius Cæsar* and *The Merchant of Venice*. J. G. van Blom (1796-1871) was a poet of the people, and J. F. van der Wey-Rutgers, H. G. van der Veen, and C. Wielsma wrote of child-life. Waling Dykstra (1821—) is the most prolific of contemporary Frisian authors, while the most elegant is probably Pieter Jelles Troelstra (1860—), who is known not only as a lyric poet, but, also as one of the editors of the Frisian monthly *For Hûs en Hiem*.

BIBLIOGRAPHY. The most complete account of the Frisian language and literature is found in Siebs, *Geschichte der friesischen Sprache*, in Paul's *Grundriss der germanischen Philologie*, vol. i. (2d ed., Strassburg, 1901), and *Geschichte der friesischen Literatur*, vol. ii. (ib., 1893), where references to all the literature on the subject are collected. Consult also: Bendsen, *Die nordfriesische Sprache nach der Mohringer Mundart* (Leyden, 1860); Johansen, *Die nordfriesische Sprache nach der Föhringer und Amrumer Mundart* (Kiel, 1862); Winkler, *Algemeen nederduitsch en friesch Dialecticon* (The Hague, 1874); Cummins, *Grammar of the Old Frisian Language* (London, 1887); Colmjon, *Beknopte friesche Spraakkunst vor den tegenwoordigen Tijd* (2d ed., Joure, 1889); Siebs, *Zur Geschichte der englisch-friesischen Sprache* (Halle, 1889); van Helten, *Altostfriesische Grammatik* (Leeuwarden, 1890); Outzen, *Glossarium der nordfriesischen Sprache* (Copenhagen, 1837); Richthofen, *Altfriesisches Wörterbuch* (Göttingen, 1840); Sturenburg, *Ostfriesisches Wörterbuch* (Aurich, 1862); ten Doornkaat Kooman, *Wörterbuch der ostfriesischen Sprache, etymologisch bearbeitet* (3 vols., Norden, 1879-84); Dykstra and Hettema, *Friesch Woordenboek* (Leeuwarden, 1896 et seq.); Richthofen, *Friesische Rechtsquellen* (Berlin, 1840); Hettema, *Oude friesche Wetten* (Leeuwarden, 1845-51); id., *Untersuchungen über friesische Rechtsgeschichte* (Berlin, 1880-86); id., *Bloemlezing uit oud-, middel- en nieuwfriesche Geschriften* (Leyden, 1887 et seq.); Siebs, *Sylter Lustspiele* (Greifswald, 1898).

FRIT (Fr. *fritte*, from It. *fritta*, frit, from *friggere*, Lat. *frigere*, to parch). An active greenish-black fly (*Oscinis frit*) of the size of a large flea, which does great injury to barley crops in the north of Europe. It lays its eggs in the flowers, and its larvæ live on the young grains. The family is represented in America by the species *Oscinis variabilis* and other minute 'grass-stem flies' of the genera *Meromyza*, *Chlorops*, etc., which damage various crops. In the Southern States they swarm in clouds at certain seasons and get into the eyes of animals and men, and

to them has been attributed the spread of the disease pink-eye (q.v.).

FRITH, or **FRYTH**, JOHN (1503-33). An English Protestant martyr. He was born at Westerham, in Kent, and educated at Eton and Cambridge, where Gardiner, subsequently Bishop of Winchester, was his tutor. Immediately after taking his bachelor's degree (1525), invited by Wolsey, he transferred his residence to the newly founded Cardinal College (now Christ's Church), Oxford. He made the acquaintance of Tyndal, and assisted him in his translation of the New Testament. His zeal in the cause of the Reformation led to his imprisonment at Oxford for some months. At the instance of Wolsey he was released (1528), and fled to the Continent, where he resided chiefly at the newly founded Protestant University of Marburg, and was again associated with Tyndal in literary labors. At Marburg he became acquainted with several scholars and Reformers of note, particularly with Patrick Hamilton (q.v.). His first publication was a translation of Hamilton's *Places*, made shortly after the martyrdom of the author, and soon afterwards appeared *A Pistle to the Christen Reader*, under the pseudonym 'Richard Brightwell' (1529), and *A Disputacion of Purgatorye*, a treatise against Rastell, Sir Thomas More, and Fisher, Bishop of Rochester (1531). In 1532 he ventured back to England. Warrants for his arrest were almost immediately issued, at the instance of More, then Lord Chancellor. After evading pursuit for some weeks, he fell into the hands of the authorities as he was on the point of making his escape to Flanders. The rigor of his imprisonment in the Tower was abated when Sir Thomas Audley succeeded to the chancellorship, and it was understood that both Cromwell and Cranmer were disposed to leniency. But the treacherous circulation of a manuscript, *Lytle Treatise on the Sacraments*, which Frith had written for the information of a friend, with no view to publication, further excited the hostility of his enemies. He was tried and found guilty of denying that the doctrines of purgatory and transubstantiation were necessary articles of faith. June 23, 1533, he was handed over to the secular arm, and was burnt at Smithfield, London, July 4. During his captivity he wrote a controversial work on the eucharist, and several tracts. Frith was the first to maintain the doctrine regarding the sacrament of Christ's body and blood which ultimately came to be incorporated in the English communion office. Twenty-three years after his death as a martyr, Cranmer, who had been one of his judges, went to the stake for the same belief, and three years later it had become the publicly professed faith of the English nation. Frith's works were published by Foxe (London, 1573), and there was another edition in 1631.

FRITH, WALTER. An English dramatic author and critic; the son of the Royal Academician W. Powell Frith. He was born in London, was educated at Harrow and Cambridge, then studied law, and became a barrister in 1880. Among his literary works, besides other publications, are a number of plays which have been produced in London and elsewhere; the list includes: *Brittany Folk* (1889); *The Verger* (1892); *Her Advocate* (1895); *Not Wisely but Too Well* (played by the Kendals in London in

1898); and *The Man of Forty*, his best-known piece, brought out by George Alexander in March, 1900, and reproduced in New York in November of the same year, at Daly's Theatre.

FRITH, WILLIAM POWELL (1819—). An English figure and genre painter. He was born near Ripon, Yorkshire, January 9, 1819. He was a pupil of Sass's noted art school in Bloomsbury, and a student of the Royal Academy. In 1840 he exhibited his "Malvolio Before the Countess Olivia," which attracted much public attention. His "Village Pastor," painted in 1845, made him an associate member of the Academy. For some time he continued to paint in a similar vein, producing his pictures, "The Parting Interview of Leicester and the Countess Any," "The Coming of Age," "Pope Making Love to Lady Mary Wortley Montagu," etc. But it was not until Frith was elected a Royal Academician in 1853 that he took on a new manner in portraying the humorous aspect of an English crowd. His "Life at the Seaside, Ramsgate," was a lively interpretation of a cockney gathering when abroad for a holiday. It was purchased by Queen Victoria. Frith's "Derby Day," painted in 1858, and said to be the picture of the year, in popularity at least, was a vivid representation of this English carnival, and executed with most admirable finish. Frith painted the "Marriage of the Prince of Wales" (1865), a commission from Queen Victoria. Among his later works are the "Railway Station," "The Road to Ruin" (1878), and "Private View of the Royal Academy" (1881). Consult: Frith, *My Autobiography and Reminiscences* (London, 1887); id., *Further Reminiscences* (ib., 1888); Muther, *History of Modern Painting* (New York, 1896).

FRITHJOF'S SAGA, frēt'yófs sǫ'gá. An ancient Icelandic myth. It was probably first written down at the end of the thirteenth or in the beginning of the fourteenth century, and records the life and adventures of the hero Frithjof (properly *Fridhthjófr*, 'peace-destroyer'), who loved the beautiful Ingeborg, the daughter of a petty king of Norway. After being rejected by the brothers of Ingeborg, and having committed various acts of revenge on his enemies, he comes to the Court of the old King, Hring, to whom Ingeborg has been married, and is received with kindness. At the death of her husband, Ingeborg is married to her lover, who acquires with her hand the dominions of Hring, over which he rules prosperously to the end of his days. Frithjof is supposed to have lived in the eighth century; but some writers assign to him a much earlier period. This saga was included by Björner in his collection *Nordiska Kämpadater* (Stockholm, 1737); and by Rafn in his *Fornaldar Sögur Nordhrlanda* (Copenhagen, 1829). Attention has of late years been more especially drawn to this ancient saga, which is, in fact, merely one of a number of similar mythical narratives, in consequence of the Swedish poet Tegnér (q.v.) having selected it for the groundwork of a poem ("Frithjof's Saga"), which was published in its complete form in 1825, and at once became the most popular poem that had ever appeared in Sweden, and raised its author to the height of his reputation. Tegnér has been justly blamed for giving to his hero qualities that are at utter variance with the conditions under which he lived. While a certain

amount of idealization was necessary in order to adapt the story to the demands of modern taste, the poet was not justified in making a sentimental troubadour out of a Norse viking. But in spite of these striking faults the poem possesses lyrical beauties that amply insure it a permanent place in Swedish literature. The "Frithjof's Saga" of Tegnér has been translated into most of the European languages; among the six or seven English translations, we may instance those by Latham (London, 1838) and Stephens (ib., 1841).

FRITIGERN, frít'gèrn, or **FRIDIGERN**. A Visigothic chieftain. When, in 376, the Visigoths were crowded from Dacia by the inroads of the victorious Huns, he was permitted by Valens, Emperor of the East, to transport his band, which nominally, at least, was Christian, across the Danube, and to settle it in Mœsia. Quarrels ensued between the immigrants and the Roman officials, and culminated in the battle of Adrianople (August 9, 378). Fritigern, in principal command of the Visigoths, there destroyed fully two-thirds of Valens's army, thus inflicting a defeat, which, for actual loss on the field, was equaled in Roman annals only by the disaster at Cannæ (B.C. 216). Valens himself was killed and his body was never recovered. Fritigern's leadership for a brief time maintained Visigothic unity, which was dissolved immediately after his death.

FRITILLARY (from Lat. *fritillus*, dice-box, from the form of the perianth), *Fritillaria*. A genus of bulbous-rooted plants of the order Liliaceæ, natives of Europe and other temperate regions of the Northern Hemisphere. The drooping perianth, which is bell-shaped, has six distinct segments, each with a conspicuous honey-pore (nectary) at the base. About forty species, some beautiful, are known. One species, the common fritillary, or snake's-head (*Fritillaria meleagris*), a native of Great Britain, blooms in April and May in meadows and pastures in the east and south of England. The stem, about a foot high, bears several linear leaves, and, in general, only one flesh-colored, dark-spotted flower. Many varieties, including the crown imperial (*Fritillaria Imperialis*), a native of Persia and the north of India, are in cultivation. Among the indigenous American species, which have scaly bulbs and are confined to the Pacific coast, the best known are *Fritillaria pudica*, *Fritillaria recurva*, and *Fritillaria camtschatcensis*, sometimes called black lily, which occurs from California to Alaska and in Siberia. In Alaska the bulbs were formerly gathered, dried, and, to a considerable extent, eaten. They are surrounded by many small white bulblets of the size and shape of a grain of popcorn, and are sometimes called wild rice. They have been frequently taken from the crops of birds at considerable distances from where they were grown.

FRITILLARY (Neo-Lat. *fritillaria*, nom. pl., from Lat. *fritillus*, dice-box), or **SILVERSPOT**. A nymphaline butterfly, of a group mostly the genus *Argynnis*, with fulvous and black checkered wings. The hind wing is often marked with a row of silvery eye-spots. There are more than fifty species in the United States, whose larvae feed at night on violets. The great spangled (*Argynnis Cybele*) and the variegated fritillary (*Euptoieta claudia*) are two common North American representatives.

FRITSCH, frich, ANTON JOHANN. See FRIC.

FRITSCH, GUSTAV THEODOR (1838—). A German scientist and traveler, born at Kottbus (Brandenburg). He studied at Berlin, Breslau, and Heidelberg; in 1863-66 made a scientific journey to South Africa, and in 1867 became an assistant in the Anatomical Institute at Berlin. In 1868 he was a member of the expedition to Aden to observe the total eclipse of the sun, and in 1847 of the expedition sent to Isphahan, Persia, to observe the transit of Venus. He was appointed in the latter year to the chair of comparative anatomy at the University of Berlin, and subsequently to that of physiology. Under commission from the Royal Academy of Sciences, Berlin, he visited the Mediterranean countries in 1881-82 for the study of electric fishes. His publications include: *Drei Jahre in Südafrika* (1868); *Die Eingeborenen Südafrikas* (1873), anatomical and ethnographical observations; *Untersuchungen über den feinem Bau des Fischgehirns* (1878); and *Die elektrischen Fische* (2 parts, 1886-90).

FRITSCH, JOHANN (1849—). A German neurologist, born at Tepl, Bohemia. He studied at the University of Vienna, was appointed a lecturer there, and afterwards professor of psychiatry. His publications include: *Ueber die primäre Verrücktheit* (1879), and *Erfahrungen über Simulation geistiger Störung* (1890).

FRITSCH, KARL (1812-79). An Austrian meteorologist, born at Prague. He attended the university there, was for a time a Government official, but privately pursued meteorological investigations, and from 1862 to his retirement in 1872 was vice-director of the Austrian meteorological service. Large increase was made by him in the number of observation stations, and he contributed valuable articles to the publications of the Vienna Academy and of the Oesterreichische Gesellschaft für Meteorologie.

FRITSCH, KARL. Baron (1838—). A German geologist, born at Weimar. He studied at the University of Göttingen, and in 1873 became professor of geology at Halle. His publications include: *Reisebilder von den Kanarischen Inseln* (1867); with Reiz, *Geologische Beschreibung der Insel Tenerife* (1868); and *Allgemeine Geologie* (1888).

FRITZ, frits, DER ALTE (Ger., Old Fritz). A nickname given by the soldiers to Frederick the Great.

FRITZ, JOHN (1822—). An American expert in the manufacture of iron and steel, born at Londonderry, Pa. He was trained as a machinist in small establishments at Parkersburg and Norristown, and afterwards was employed in the construction of rolling-mills. In this connection he made so thorough a study of the details of iron and steel manufacture as to become an authority on the subject, and to be commissioned with the equipment of the Cambria Iron Works and the well-known Bethlehem Iron and Steel Works. For many years he was manager of the latter. He was among the first to introduce the Bessemer process into the United States, and a pioneer in other methods now generally used. In his honor a medal was established by a group of scientists and manufacturers in 1902, to be known by his name and to be awarded in recognition of notable discoveries in industry and science.

FRITZ, SAMUEL (1653-1728). A German Jesuit missionary, born in Bohemia. He entered the Jesuit Order, and in 1686 became a missionary on the Upper Amazon. Owing to ill health he withdrew to the Portuguese colony of Para, at the mouth of the river, and was held prisoner as spy there until 1691, by the Governor. Having been liberated and having reported to the Viceroy at Lima his various observations, he returned to his missionary field in 1693. During his forty-two years of activity among the Indians he founded the Omaguas missions and others, and prepared the material for his great map of the Amazon. This appeared at Quito in 1707, in the *Lettres édifiantes* (vol. xii.) in 1717, and was for many years the recognized authority on the region included by the river system.

FRITZ, UNSER (Ger., Our Fritz). A name given by the Germans to Frederick William, Crown Prince of Prussia, later Emperor Frederick III.

FRITZLAR, frits'lär, HERBERT and HERMANN VON. See HERBERT and HERMANN VON FRITZLAR.

FRITZNER, frits'nër, JOHANN (1812-93). A Norwegian lexicographer, born at Askö, near Bergen. He was educated at Christiania, and after holding several pastorates devoted himself entirely to scientific labors, as a result of which he published the *Ordbog over det gamle norske Sprog* (2d ed. 1884 et seq.), an excellent dictionary of ancient Norse.

FRITZSCHE, frit'she, ADOLF THEODOR HERMANN (1818-78). A German philologist. He was born at Groitzsch, Saxony, and was educated at Leipzig, where, after an activity of several years at the University of Giessen, he occupied the chair of philology from 1850 until his death. Besides original poems in Latin and German, he published valuable editions of several works of the Greek and Roman classics, the most noteworthy being the editions of *Theocritus* (2d ed. 1869), and of the *Satires of Horace* (1875-76).

FRITZSCHE, CHRISTIAN FRIEDRICH (1776-1850). A German theologian, born at Naundorf. He was educated at Leipzig, and was professor of theology at Halle from 1830 until his death. During a great part of this time he acted as censor for theological publications. Besides numerous articles published as *Fritzschorum Opuscula Academica* (1838), he wrote *De Anamartesia Jesu Christi* (1835-37), and several minor works.

FRITZSCHE, FRANZ VOLKMAR (1806-87). A German classical scholar, son of Christian Friedrich Fritzsche. He was born at Steinbach, in Saxony, and after studying under Beck and Hermann at the University of Leipzig, was professor of eloquence and poetry at Rostock from 1828 until his death. His works deal chiefly with Lucian and the Greek dramatists, particularly Aristophanes. Among the most important are the *Questiones Lucianæ* (1826); an edition of the *Dialogi Deorum* (1829); and of Aristophanes's *Thesmophoriazusæ* (with a commentary, 1838) and *Ranæ* (1845); and a critical edition of Lucian's complete works (1860-74). In defense of his old teacher, Hermann, he published *Reconsion des Buches Æschylos Eumeniden von K. O. Müller* (1834).

FRITZSCHE, KARL FRIEDRICH AUGUST (1801-46). A German theologian, the eldest son of Christian Friedrich Fritzsche. He studied under his

father and subsequently attended the University of Leipzig. After holding a professorship at that institution for one year, he was successively appointed to the chair of theology at Rostock (1826-41), and Giessen (1841-46). His philological interpretations of biblical texts are considered accurate, and in the defense of his views he revealed himself a skillful controversialist. His principal works are the *Commentaries on Matthew* (1826); *Mark* (1830); and the *Epistle to the Romans* (1836-43).

FRITZSCHE, OTTO FRIDOLIN (1812-96). A German theologian, son of Christian Friedrich Fritzsche, born at Dobrilugk, southwest of Frankfurt; he studied at Halle, became professor extraordinary at Zurich, 1837; full professor, 1842; and also chief librarian at the cantonal library in 1844. He published a critical edition of Lactantius (1842-44); *The Life and Writings of Theodore of Mopsuestia* (1836), and his *Exegetical Fragments* (1847); Anselm's *Cur Deus Homo?* (1868); and other works. He is best known by his work on the Old Testament *Apocrypha and Pseudepigrapha* (6 vols., 1851-60).

FRIULI, frî-ô-lee (Lat. *Forum Julii*). The name of a district on the north and northeast shores of the Adriatic Sea, now forming the Province of Udine, Italy, and the Austrian coast districts of Görz and Gradisca (Map: Italy, G 1). Friuli was anciently one of the thirty-six duchies into which the Longobards divided the north of Italy. It was from an early period divided into Tyrolese and Venetian Friuli, the former of which came into the possession of Austria in 1500, while the latter remained attached to Venice till the Peace of Campo-Formio (1797), when it also was given to Austria. Venetian Friuli finally came into the possession of Italy in 1866. The inhabitants, called Furlani, are for the most part Italian, but speak a peculiar dialect.

FRIULI, DUKE OF. See DUROC, GÉRAUD CHRISTOPHE MICHEL.

FRIZZLE. A breed of fowls, so called from the strangely curled ends of the feathers, especially those of the neck and back. They are bred largely for their grotesque appearance, but are hardy and useful.

FRÖBEL, frê-bel, FRIEDRICH WILHELM AUGUST (1782-1852). A German educationist, the famous promoter of what is known as the kindergarten movement. He was born at Oberweissbach, in Thuringia, April 21, 1782, where his father was a pastor of the old Lutheran Church. As his mother died while her son was an infant, the boyhood of the future friend of children was lonely, and his father's second marriage did not increase the happiness of the child. He became strongly introspective, and the severity of the religious influences under which he was trained placed him in a morbid attitude toward life, both the present and the future, a disposition which he overcame in his majority. At the age of ten years, he was sent to his uncle in the town of Ilm, where a happier life began. When fifteen he was apprenticed to a forester, and his duties were such that while he added to his knowledge of the outer world, he could devote himself (as he says) "in many various ways to self-education, self-instruction, and moral ad-

vancement. Especially did I love to indulge my old habit of self-observation and introspection."

In 1789, when the days of his apprenticeship were over, he went to Jena, and for several months came under the influence of the university, where his brother had been enrolled as a student of medicine. His studies were irregular and unfruitful, and at length, after confinement for several weeks in the 'carcer,' because he had not money to pay his bills, he withdrew from the university and secured employment in the Office of Woods and Forests, in the Territory of Bamberg. He was then brought again into close companionship with Nature, for his calling required him to live out of doors in a region of lovely scenery. After a short service of this kind, he was engaged as a surveyor in the service of the Bavarian Government, and later he became manager of a private estate. Having inherited a little property at the death of an uncle, he determined to become an architect, and for this purpose went to Frankfort-on-the-Main. Gruner, the master of the Frankfort Model School, then said to him: "Give up architecture. It is not your vocation at all. Become a teacher. We want a teacher in our own school. Say you will agree, and the place shall be yours." The young man accepted, and thus began his educational career. Gruner had been a pupil of Pestalozzi, whose name was the watchword of the Frankfort School. "It soon became evident to me," says Fröbel, "that Pestalozzi was to be also the watchword of my life." So Fröbel went to Yverdon and remained, for a fortnight, on a visit to the great educational reformer, whom he greatly admired, but whose methods he did not wholly approve. Uncertainty as to his calling, due perhaps to fickleness, perhaps to versatility, perhaps to genius, still embarrassed him. Several openings came to him, but none attracted him. So he returned to Pestalozzi and remained many months at Yverdon, where he wrote out an account of the work there in progress. His career continued uncertain, and he tried once more the environment of university life, first at Göttingen, and then at Berlin, where he showed such proficiency in mineralogy that his professor, Dr. Weiss, gave him an assistant's post in the mineralogical museum. War interrupted this service. In 1813 he joined Lützow's famous troop and saw some active service, and again in 1815 he enlisted as a volunteer. At the close of the war he determined to devote himself to the promotion of education. A curious passage in his autobiography declares that in the mineralogical laboratory "the stones in my hand turn to living, speaking forms. The crystal-world, in symbolic fashion, bore unimpeachable witness to me, through its brilliant unvarying shapes, of life and of the laws of human life, and spoke to me with silent yet true and readable speech of the real life of the world of mankind."

His approaching marriage (in 1818) may have had some influence in concentrating his mind upon the purpose of life, for he founded in 1816 a school at Greisheim (afterwards removed to Keilhau), called 'the Universal German Educational Institute,' and in it he proceeded to develop his plans. Up to this time all the events of his life had been preparatory. He was now thirty-six years old, his life half gone. During

the next thirty-four years his work was accomplished.

Eight years later he published his most important book, a volume entitled *Menschen-erziehung* (Education of Man), which is a sort of cornerstone in his philosophy of education. Notwithstanding its comprehensive title, it really discusses the education of a child. The Institute awakened suspicion, and finally opposition, on the part of conservative governments, and the Prince of Schwarzburg-Rudolstadt caused an official inspection of it to be made. The report, on the whole, was favorable. Fröbel's attention was now called by Krause (a well-known philosopher, whose acquaintance he had made) to the writings of Comenius, and from them he received a fresh impulse toward the development of his educational plans. After unsuccessful attempts to establish his Institute at Helba, near Meiningen, and afterwards near Lucerne, at Willisau, the Bernese Government invited Fröbel to consider a plan for founding an orphanage at Burgdorf. To this place he removed in 1835, and success followed the change. It is said that he considered, at this time, a visit to the United States in order to establish his system in a new country. He was now committed fully to the doctrine that the education of the nursery must be reformed, and the need of training for mothers became more and more evident to him. After a short stay in Switzerland, he went to Berlin in 1836, returned to Keilhau, and then established himself in Blankenburg, a small town not far from Keilhau. Langenthal, Middendorf, and Barop were his serviceable assistants. About this time he hit upon the name 'kindergarten,' which has since been introduced into many lands and many tongues—a much better term than one originally employed by Fröbel—'Anstalt für Kleinkinderpflege' (an institution for the care of little children). His friend Barop tells this story: "Middendorf and I were one day walking to Blankenburg with him over the Steiger Pass. He kept on repeating, 'Oh, if I could only think of a good name for my youngest born!' Blankenburg lay at our feet, and he walked moodily toward it. Suddenly he stood still as if riveted to the spot, and his eyes grew wonderfully bright. Then he shouted to the mountain so that it echoed to the four winds, 'Eureka! Kindergarten shall the institute be called!'"

Embarrassments still beset him. His ideas were not generally accepted; he lacked money for the maintenance of his school; his publications were not remunerative; more than this, his nephew, Carl Fröbel, a professor at Zurich, became the loud advocate of measures which were radical, if not revolutionary, and Frederick Fröbel was accredited with his nephew's opinions. In 1851 Von Raumer, Minister of Education and Public Worship, forbade the foundation of kindergartens in Prussia, and the edict remained in force until 1860, long after Fröbel's death. After 1850 Fröbel made his home in Marienthal, where the Grand Duke of Weimar gave him the use of a country seat. Here he was aided in his school by Luise Levin, who in 1851 became his second wife, and by Alwine Middendorf, who married Dr. W. Lange, the future editor of his writings. His death occurred June 21, 1852. The school at Marienthal was then removed again to Keilhau.

Fröbel's literary style was not good, and his

works were never popular; but his thoughts arrested the attention of able and influential people, and by these interpreters and followers kindergarten methods have been introduced into many countries. "Let childhood ripen the children," says H. C. Bowen, "is the keynote of the new gospel." "It is what he did for the education of children between the ages of three and seven that chiefly demands our gratitude." As a statement of his principles, the summary given by H. C. Bowen is adequate: "The main principles, it will be remembered, whose applications form Fröbel's system, are: self-activity, to produce development; all-sided connectedness and unbroken continuity, to help the right acquisition of knowledge; creativeness or expressive activity, to produce assimilation of knowledge, growth or power, and acquisition of skill; well-ordered physical activity, to develop the physical body and its powers; and happy and harmonious surroundings, to foster and help all these." (*Fröbel and Education by Self-Activity*, pp. 180-81.)

The principal writings of Fröbel have been collected in three volumes by W. Lange (Berlin, 1862), and by Friedrich Seidel (Vienna, 1883). Among them the most important is the *Education of Man*, which appeared in 1826. It has been translated into French and into English. The *Mutter- und Kose-Lieder* (Mother's Songs, Games, and Stories) has had many translators. The autobiographies were translated by H. K. Moore and Emilie Michaelis, and in part also by Miss Lucy Wheelock (new ed. London, 1899).

In addition to his own writings, materials pertaining to the life and influence of Fröbel are abundant, and are enumerated in bibliographies that are readily accessible. A selection is not easy. Dr. Barnard's collection of *Papers on Fröbel's Kindergarten* (Hartford, 1881) is comprehensive and important. There are two English translations of *The Education of Man*, one by Miss Josephine Jarvis (New York, 1885) and the other by W. N. Hailman (ib., 1887). The *Mother Play* (ib., 1895), in two volumes, was translated by Miss Susan E. Blow, who has also written a book on *Symbolic Education* (ib., 1894), a commentary on the first five songs of the *Mother Play*, and a volume entitled *Letters to a Mother* (ib., 1900).

Among the estimates of Fröbel's work, these citations may be made. Henry Barnard declared the kindergarten to be by far the most original, attractive, and philosophical form of infant development the world has yet seen. Dr. James Ward holds that the kindergarten system, in the hands of one who understands it, produces admirable results, but is apt to be too mechanical and formal. F. W. Parker says that the kindergarten is the most important, far-reaching educational reform of the nineteenth century. Mr. Quick in his *Educational Reformers* (New York, 1890), from which these words are taken, concludes his estimate by saying that among those who have contributed to the science of education there are probably no greater names than those of Pestalozzi and Fröbel. The memoir by H. Courthope Bowen in the Great Educators Series, edited by Nicholas Murray Butler (New York, 1897), is an admirable study of Fröbel's principles. The fullest biography is that by A. B. Hauschmann. A short memoir was written by Miss Emily Shirreff. Of the last four years of

Frobel's life there are delightful reminiscences by an accomplished enthusiast, the Baroness von Marenholtz-Bülow, translated by Mrs. Horace Mann (Boston, 1887). Two autobiographical fragments (a letter to the Duke of Meiningen, and a letter to the philosopher Krause), which narrate the perplexities and obstacles of his early life, are contained in a volume entitled *Autobiography of Frobel* (Syraese, 1889). It also includes a convenient bibliography. See KINDERGARTEN; PEDAGOGY; CHILD PSYCHOLOGY.

FROBEL, JULIUS (1805-93). A German writer and politician, nephew of Friedrich Frobel. After studying at Munich, Weimar, and Berlin, he went to Switzerland, and in 1833 became professor of mineralogy in the university of Zurich. In the interests of the extreme Radical Party, he edited *Der schweizerische Republikaner*. In 1844 he established a publishing house at Zurich, and issued several scientific works and many political pamphlets. Some of his works were suppressed by the Government. In 1846 he took up his residence in Dresden, until the Revolution of 1848, when he became a leader of the Democrats and a member of the National Assembly at Frankfort-on-the-Main. He accompanied Robert Blum to Vienna, and was arrested and sentenced to death, but was pardoned by Windischgrätz. After the dissolution of the Parliament he came to the United States; edited a German paper in New York; went, in 1850, to Nicaragua, and afterwards engaged in one or two commercial expeditions to Santa Fé and Chihuahua. In 1855 he edited a journal in San Francisco, and in 1857 returned to Germany. From 1862 to 1873 he edited newspapers in Vienna and Munich. He was German consul at Smyrna from 1873 to 1876, and at Algiers from 1876 to 1889. He retired from active life in 1890. His works include: *Aus Amerika* (1857-58), translated by himself in 1859 under the title of *Seven Years' Travel in Central America, Northern Mexico, and the Far West*; *Die Wirtschaft des Menschengeschlechts* (1870-76); and *Ein Lebenslauf* (1890-91), his autobiography.

FROBEN, frō'ben, or FROBENIUS, JOANES (1460-1527). A German scholar and printer. He was born at Hammelburg; was educated at the University of Basel, and established in Basel, in 1491, a printing press, at which the art of printing was first brought to a high degree of excellence in Germany. An intimate friend of Erasmus, he not only printed the latter's writings, but had his help in the editions that he printed of Saint Jerome, Saint Cyprian, Tertullian, Hillary of Poitiers, and Saint Ambrose. He did not live to carry out his project of editing the Greek Fathers, but it was creditably done by his son Jerome and his son-in-law, Nikolaus Episcopiuss. See ERASMUS.

FROBERGER, frō'bër-gër, JOHANN JAKOB (c.1605-67). A German organist, born probably at Halle. When very young he entered the Imperial choir in Vienna, in 1637 was Court organist there, and the same year went to Rome to study under Frescobaldi. He was again Court organist, 1641-45 and 1653-57, in Vienna, and then made a series of concert tours, appearing with great success in London and Paris. Froberger is a most important figure in the history of organ music, combining German power of ex-

pression with Italian nicety of form, but his numerous compositions are now seldom heard. He died at Héricourt, France.

FROBISHER, Sir MARTIN (1535?-94). An English navigator and the first of his nation to seek a northwest passage to China. He was born either at Doncaster or Altofts, in Yorkshire, and belonged to a family which came originally from Wales. His early years were spent in voyages to the coast of North Africa, and to the Levant. In 1575, at the instigation of Elizabeth, he received a license from the Muscovy Company to search for the Northwest Passage. With two vessels of 25 tons each and a pinnace of 10 tons, he sailed north in 1576, sighted the southern point of Greenland, which he took to be the Friesland of the brothers Zeni, and came a few days later to a cape he named Queen Elizabeth's Foreland, near the southeast end of Frobisher Bay, which he supposed to be a strait. After a fortnight's exploration of the coasts and islands, he returned to England, bringing with him ore picked up on one of the islands he discovered. The prospect of unlimited wealth aroused the attention of the merchant adventurers of the time. A second expedition, better equipped than the first, was fitted out and the command was given to Frobisher. He sailed in May, 1577, but his activity was chiefly confined to hunting for gold, and his discoveries, which were comparatively trifling, were restricted to the locality which he had previously visited. A third expedition, with fifteen ships, was sent out in the year following with no other result than the discovery of a new strait, which was not explored until the time of Henry Hudson. Frobisher afterwards served under Drake in the West Indies; and was knighted for distinguished service in the fight with the Spanish Armada (1588). In the spring of 1591 he was sent by Sir Walter Raleigh with a squadron to ravage the Spanish coast, and hold the attention of the Spanish fleet while efforts were made to intercept the merchant vessels laden with bullion on their way from Panama. He died on November 7, 1594, from the effects of a wound received while leading an attack by sea against Brest, then in the hands of the Spaniards. The narrative of Frobisher's three voyages may be found in the Hakluyt Society Publications for 1867. For an account of his life, consult Jones (London, 1878).

FROBISHER BAY. An inlet of Davis Strait, in North America, opening westward between Hudson Strait and Cumberland Peninsula, into the territory called the Frobisher Meta Incognita, at the southern end of Baffin Land (Map: North America, M 3). It is about 200 miles long and above 20 wide, with rugged mountainous shores. It was till Hall's voyage called Frobisher Strait, being erroneously regarded as a passage into Hudson Bay.

FROG (AS. *frogga*, Icel. *froskr*, OHG. *frosch*, Ger. *Frosch*; ultimately connected with OHG. *frō*, Ger. *froh*, joyous, Skt. *prñ*, to jump). Any member of the Ranidae, a family of tailless Amphibia, of the group Firmisternia (q.v.), i.e. the two halves of the shoulder-girdle meet and are firmly united in the median ventral line, so that the chest cannot be expanded; and in this family, as distinctive from other Firmisternia, the sacral diapophyses are cylindrical. The young, known as 'tadpoles,' live in the water, have fringe-like external gills, which disappear while they are still

young, are without legs, and have a tail provided with a membranous swimming-fin.

The family Ranidæ is divided into three sub-families, according to the arrangement of the

TYPES OF SHOULDER-GIRDLE.

1, 2, Archerfous (Bombinator and Bufo); 3-7, Firmisternal types (3, adult Rana; 4, young Rana, showing change from archerfous to firmisternal type with advancing age; 5, Hyla; 6, Brevicaps; 7, Cacopus). Cartilaginous parts are dotted; ossified parts are left white. Lettering: *cl*, clavicle; *co*, coracoid; *e*, epicoracoidal cartilage, *h*, humerus; *m*, metastrut; *o*, omosternum; *p*, precoracoid; *sc*, scapula; *ss*, suprascapula.

teeth: (1) *Ceratobatrachina*, with teeth in both jaws. This is represented alone by the great horned, tree-climbing frog (*Ceratobatrachus Guentheri*) of the Solomon Islands, which is remarkable chiefly for its extraordinary adaptation in color and appearance generally to its customary surroundings, giving it entire concealment from ordinary observation. (2) *Ranina*, with teeth (vomerine) in the upper but none in the lower jaws. This is the group of true frogs, regarded as a family by most authors previous to 1901, and typified by the genus *Rana*, which contains about 140 species. (3) *Dendrobatina*, an aberrant group of South American and African frogs, with no teeth at all. They are small and usually brightly colored, and take remarkable care of their young, the mother allowing the tadpoles to fasten themselves by a secretion to her back when their native puddle dries, and thus carrying them to a safer place. One Brazilian species (*Dendrobates tinctorius*) furnishes from its skin the poisonous secretion used by bird-fanciers to change the color of the plumage of the Amazon green parrots.

There are about 270 species of Ranidæ, which are distributed over nearly all parts of the world except Australia; but there are very few species in South America, and these only in the northern part. In the United States the family is well represented by thirteen species of the genus *Rana*. Of these the bullfrog (*Rana Catesbiana*), so named on account of its bellying note, is perhaps our most widely known, as it is our most characteristic frog. It is very large, attaining a length of eight inches, loves the shore, and is green with olive and dusky blotches. (See BULLFROG.) It is equaled in size only by an East Indian species (*Rana tigrina*), and by one in the Solomon Islands (*Rana Guppyi*). The leopard-frog (q.v.) or shad-frog (*Rana virescens*) is green or often brassy-colored, with two rows of

FROG CARRYING TADPOLES.

black, white-edged blotches on the back. It is the commonest North American Rana. The wood-frog (*Rana sylvatica*) is small and reddish brown, with a dark band on each side of the head; it is the most silent frog of the genus, and avoids water except at the breeding season, and its brown color well conceals it among the fallen forest leaves. The green spring-frog (q.v.) (*Rana clamata*) inhabits cold springs. It is brown or green above and white below, and may be readily distinguished by the very large ear-drums. Like most aquatic animals, frogs can change slightly the color of the skin, depending on external conditions. Two species of *Rana* are common in Europe, viz. *Rana esculenta* and *Rana temporaria*. The latter alone is indigenous to Great Britain, and varieties of it extend throughout temperate Europe and Asia to Japan, and one (variety *pretiosa*) exists in the Western United States. The edible frog (*Rana esculenta*), however, has been introduced into England. An Indian species (*Rana breviceps*) and several South African species burrow in the ground.

Besides the true frogs, several other families, such as the spadefoots (Pelobatidæ), the tree-frogs (Hylidæ), and the piping frogs (Hylodes), are often so called. These show structural affinities which bring them as near to the toads as to the frogs, and are described elsewhere under their separate names.

ECOLOGY AND HABITS. The skin of frogs is usually smooth and free from warts or horny excrescences. It is invested with a colorless epidermis, which is shed from time to time as the creature grows; this splits along the back and thighs, is worked over the head like the taking off of a shirt, and usually eaten by the wearer. The deeper layers contain much pigment, in cells which are more or less under muscular control, enabling frogs to change their hue to conform to the background. (For further information on this point, see METACHROISIS; TREE-FROG.) The skin also secretes in numerous glands a viscid, milky fluid, which is of poisonous character—in some species very decided—and is their only defensive property. That obtained from a South American frog is said to be used as an arrow-poison by the Amazonian Indians. In a rare East Indian form, the arboreal flying frog (q.v.), the skin spreads into broad webs between the greatly extended toes, enabling the animal to make long sailing leaps, analogous to those of the flying squirrel. All frogs move on land by leaps, which are often of surprising vigor and extent.

Frogs are carnivorous, and in the season of activity are likely to be very voracious. The terrestrial and arboreal forms feed mainly on insects, worms, etc. The aquatic kinds also catch insects, but subsist more on aquatic animals—worms, tadpoles, small fishes, and other frogs. These are seized and slowly swallowed, often, where the prey is large, so slowly that the engulfed parts will be digested before the remainder, perhaps still alive, has been got within the mouth.

Extremes of cold or drought in climate must be avoided by frogs. Moisture of the skin is necessary to their health, and in very dry places or seasons they survive only by going deeply under ground. Thus some tropical species get through the 'dry season.' The frogs of northern climates endure the winter by clustering about

spring-holes and other places where the water is comparatively warm and free of ice; or else by hibernating in the mud. Terrestrial species bury themselves for the winter in the loam, or burrow into the dry dust of rotting logs and stumps. Their vitality is strong, and their power of regeneration from partial congelation is very great.

Though most species live always in or near water, many spend the greater part of their time away from it, and often in bushes or trees. These, however, go to the water to breed; and as this function is likely to demand attention early in the spring, it is then that these animals make themselves most conspicuous by the incessantly uttered croaking or rattling calls of the males, which are almost as varied as the songs of the birds, and more ventriloquistic. These are wholly the cries of the male frogs, and cease when the mates have been found and have spawned; and to assist in producing them many species have gular air-sacs, which are connected with the vocal organs and furnish the power required for the loud and insistent utterances. The great ear-drums correlated with this vocal power are conspicuous in many species.

The reproductive habits of frogs are various. All of our common species lay their eggs in water, the eggs being fertilized as they are laid. As the eggs are laid they are inclosed in a gelatinous envelope secreted by the female. This swells and protects the eggs from injury, from

ACTION OF FROG'S TONGUE IN CATCHING A FLY.

being fed upon, from the direct rays of the sun, and in some species it serves to float the eggs at the surface of the water, where oxygen is most abundant; finally, the envelope serves as food for the young frog. The mouth of the tadpole is small and provided with a horny beak, which takes the place of the teeth which are not yet developed. The tadpole feeds on algæ that cover stones, and on the flesh of dead animals. The long, spirally coiled intestine, which can be seen on the under side of the animal, is an adaptation to its prevailing herbivorous diet, which requires a prolonged digestion.

The tadpole usually lives in the water for two or three months before it takes to land. In the bullfrog, however, the transformation (see TOAD) does not take place until the second summer.

In many tropical frogs the reproductive habits are much modified. One species (*Phyllobates trinitatis*) of Venezuela and Trinidad carries its tadpoles on its back, to which the young attach themselves by means of their suckers. A frog of the Seychelles Islands lives in the tree-ferns far from water, and carries its young about on its back, to which they are attached by their bellies. In the Kameruns lives a frog that lays its eggs in a foamy mass on the leaves of a tree. When the larvæ are developed the mass becomes slimy and the tadpoles swim about it, and when a heavy rain falls they are washed into pools of water lying at the bases of the trees. The foam is probably produced as it is in culinary operations, by air being entangled in it by a beating that the frog gives the jelly with its feet. The in-

closed air may well serve in respiration. Compare TOAD.

UTILITIES. Among both civilized and savage men frogs are a culinary dainty. The edible European frog is so much prized in France that

DEVELOPMENT OF HYLODES.

Life History of *Hylodes Martinicensis*: 1. An egg with embryo about seven days old. 2. Embryo twelve days old. 3. Young frog just hatched. 4. Adult male, natural size.

it is bred for the market in large preserves. In the United States both the bullfrog and spring frog are sold in the markets. In France and the United States the hind legs alone are eaten; they are known as 'saddles' to American market-men, and are usually served at table fried. In Germany all the muscular parts are served stewed, often with sauce. Frogs have enabled man to contribute much to his knowledge of physiology. The tail of the tadpole, so frequently fed on by dragon-fly larvæ and other aquatic enemies, has great capacity of regeneration. The study of its re-formation has added to our knowledge of the regeneration of animal tissue. The circulation of the blood, so readily seen by the aid of the microscope in the web of the frog's foot, is a classic and painless class-room demonstration. Observations on the response of frog-muscle to stimuli led the great Italian physiologist Galvani to the discovery of dynamical or current electricity, known to us as galvanic or voltaic electricity. See TREE-FROG; *Factors of Organic Evolution*, in article EVOLUTION.

Fossil Forms. Fossil frogs and toads have been found in the Eocene phosphate deposits of Southwestern France, and they seem to be identical with or very closely allied to the modern genera *Rana* and *Bufo*. The Miocene deposits of Germany, France, and Bohemia have also furnished fossil frogs and toads. The genus *Palæobatrachus* of the Oligocene lignites has been obtained in large numbers in both the larval tadpole stage and the adult tailless condition. Tailed batrachians, *Stegocephalia* (q.v.), were common members of the late Paleozoic and Mesozoic faunas. The stories of living frogs and toads being found in the middle of freshly broken blocks of stone, so commonly told in various parts of the country, are scarcely worthy of credence. They have originated either in deliberate falsehoods or in misapprehension on the part of the original observer.

BIBLIOGRAPHY. Boulenger, *Catalogue of British Gracilientia* (London, 1882), and many papers in the *Proceedings of the Zoological Society of London*; Cope, *Standard Natural History*, vol. iii. (Boston, 1885); Cope, *Batrachia of North America* (Smithsonian Institution, Washington, 1889); Gadow, *Amphibia and Reptiles* (London, 1901). The last (vol. viii. of the *Cambridge Natural History*) is the most recent and comprehensive work on the subject, both systematically and descriptively. For structure and dissection, consult Miavart, *The Common Frog* (London, 1874); Marshall, *The Frog: An Introduction to Anatomy, Histology, and Embryology* (6th ed., New York, 1896). For fossil forms, consult: Wölterstorff, "Ueber fossile Frösche, insbesondere Palæobatrachus," in *Jahresberichte des Naturwissenschaftlichen Vereins von Magdeburg* (1885-86).

See Colored Plate of AMERICAN FROGS AND TOADS, accompanying the article TOAD.

FROG. See HORSE; HORSE-SHOEING.

FROG, RAILWAY. A built-up or cast framework of metal placed in railway tracks at switching points to enable the flanged wheels of the cars and locomotives to pass freely from the main track to the side track, or in the reverse direction. Frogs are known as rigid frogs and as spring-rail frogs. In first-class main tracks the spring-rail frog is now almost universally used. The principle of the spring-rail frog is explained by the accompanying diagram. In this diagram the rails A and B, leading to the frog, are the 'lead' rails. The turn-out 'wing rail' C is hinged and held in position by the spring; the main-track 'wing rail' D is fixed or rigid. In passing onto or out of the side track, the wheels Y or Z force back the spring-wing rail C by the wheel flanges entering between the wing rail and the frog-point. A car on the main track passes through the frog on a continuous rail, formed by the main rail, the frog-point, and the spring-wing rail, as indicated by the diagram. In a rigid frog the wing rail C is rigidly fastened away from the frog-point exactly the same as is the wing rail D, so as to have an open flangeway at all times. In a rigid frog there is a break in the main-track rails due to the open flangeway between

the wing rail C and the frog-point, while in a spring-rail frog there is no such break, due to the fact that the wing rail C is hinged and is held by a spring close against the frog-point. The early railway frogs were rigid frogs, and were made of cast iron. Frogs, whether rigid or spring rail, are now almost universally made of steel rails planed to shape, and held in the proper relation to each other by means of a base plate, bolts, and

clamps. For a concise technical description and discussion of frogs, consult Tratman, *Railway Track and Track Work* (New York, 1900).

FROG, NICHOLAS, or NIC. A national nickname of the Dutch. It first occurs in Arbuthnot's *Law is a Bottomless Pit*.

FROGBIT. A popular name of certain water plants of the order Hydrocharidaceæ. See ANACHARIS; VALLISNERIA.

FROGFISH. One of a family of fishes (Antennariidæ), allied to the anglers. They are remarkable for excessive ugliness. The head is larger than the body, flattened, and spiny; the mouth is very large, with many teeth; the lips are often furnished with filaments; the pectoral fins are supported by a short stalk or wrist. The skin is naked in some species, scaly in others. The species are numerous and widely distributed, and many inhabit the deep sea. They hide themselves in the sand to surprise their prey. Compare ANGLER, and see Plate of ANGLERS AND BATFISH.

FROGHOPPER. See FROTH-FLY.

FROGMORE. A royal palace and mausoleum in Windsor Park, Berkshire, England (Map: London, E 1). The palace, purchased in 1800 by Queen Charlotte, was the residence of Queen Victoria's mother, and of Edward VII. when Prince of Wales. The handsome mausoleum of Romanesque architecture, erected in memory of Prince Albert, contains the remains of the Prince Consort and Queen Victoria.

FROGMOUTH. One of a group of large birds of the East Indian and Australian region, constituting a subfamily, the Podarginæ, of the nightjar family, Caprimulgidæ. They are noted for the very wide mouth, especially in the birds of the genus *Batrachostomus*, which is capable of completely engulfing small birds. They have a soft plumage, and are largely nocturnal like the owls. They have no oil-gland, but possess a pair of large powder-down patches, one on each side of the rump. One of the best-known species is the Australian 'more-pork' (q.v.). See Plate of NIGHTJARS, GUACHARO, ETC.

FROGS, THE. One of the most brilliant of the comedies of Aristophanes, which obtained the first prize on its representation in B.C. 405. The subject of the play is the decay of tragic art, for which Euripides, who had recently died, is attacked.

FROG-SHELL. A small gastropod mollusk of the genus *Ranella*, closely related to the tritons (family Tritonidæ), so called because of a fancied resemblance of its rough, flattened form and mottled colors to a frog. There are many species in tropical waters, all of which feed upon decaying matter and are useful scavengers. See Colored Plate of MARINE GASTROPODS.

FROGS' LEGS. See FISH AS FOOD.

FROG-SNAKE. See MATIPI.

FROG-SPAWN. The popular name of certain fresh-water algae which make green and slimy masses on the surface of ponds and sluggish streams. The name is applied properly to the gelatinous mass inclosing the ova of frogs. See ALGÆ; FROG.

FROG-SPITTLE (so called because formerly believed to be the spittle of frogs). A frothy substance appearing on weeds, grasses, etc., and

produced in self-protection by the nymphs of certain plant-bugs, called frog-hoppers. In England the substance is called cuckoo-spit.

FRÖHLICH, frē'lik, ABRAHAM EMANUEL (1796-1865). A Swiss poet, born at Brugg. From 1835 until his death he was pastor at Aarau. His poems and fables are very popular, and the fables rank high among literature of that variety. His works include: *Fabeln* (1825); *Das Evangelium Sankt Johannis in Liedern* (1830); *Elegien an Wieg' und Sarg* (1835); the epics *Ulrich Zwingli* (1840) and *Ulrich von Hutten* (1845). His collected works were published in 1853.

FROHMAN, CHARLES (1858—). An American theatrical manager, one of the leaders of what is commonly called the 'Theatrical Trust,' of which he is the producing partner. He was born in Sandusky, Ohio, and before he was twenty years old became advance agent for a traveling minstrel show. After having become an independent manager of various companies 'on the road,' he established himself in 1893 at the Empire Theatre, New York, and in the season of 1895-96 formed with several managerial firms the 'syndicate,' which has gradually strengthened its position till in many parts of the country it has a practical monopoly of playhouses. He has brought out as stars Maude Adams, Julia Marlowe, John Drew, and other well-known actors.

FROHMAN, DANIEL (1853—). An American theatrical manager, born in Sandusky, Ohio. In his youth he was employed in newspaper work in New York, but he early embarked in theatrical management with traveling companies. He has managed the Fifth Avenue and Madison Square theatres (previous to 1885), and more recently the Lyceum and Daly's Theatre, besides the Daniel Frohman Stock Company and various special attractions. He is in close relations with the so-called 'Theatrical Trust,' formed by his brother Charles Frohman.

FROHSCHAMMER, frō'shām - ēr, JAKOB (1821-93). A German theologian and philosopher, born at Illkofen, near Ratisbon, and educated at Munich. For more than forty years he was associated with the University of Munich, where he occupied the chair of philosophy from 1855 until his death. Because of his radical utterances on theology he incurred the opposition of the Vatican, and was compelled to resign his position as preacher at the university in 1855. A large number of his writings were directed against the authority of the Church in matters of science, the freedom of which he defended in the work entitled *Ueber die Freiheit der Wissenschaft*, in which in some respects the keynote of the *Kulturkampf* which agitated Germany during the seventies was already sounded. The dogma of infallibility was attacked by him with equal vigor in a number of publications, which involved him in a long and bitter controversy with Catholic theologians. In his philosophical writings he defends the idealistic conception of the universe—a conception possible through a central principle which he defines as 'fantasy.' This idea is carried out in several important publications, of which the following may here be cited: *Monaden und Weltphantasie* (1879); *Die Philosophie als Idealiswissenschaft und System* (1884); *Ueber das Mysterium Magnum des Daseins* (1891).

FROHSDORF, frōs'dōrf, or **FROSCHDORF**, frōsh'dōrf (originally Krottendorf). A village of Lower Austria, 30 miles south of Vienna (Map: Austria, E 2). It has acquired some political significance, owing to the fact that its castle was the residence of the Duchess of Angoulême after 1844, and later of the Count of Chambord (q.v.), and became the rendezvous of the elder Bourbon party.

FROISSART, frwä'sär', JEAN (c.1338-1410?). A French poet and historian, born at Valenciennes. He was destined for the Church, and consequently received a liberal education, but he soon displayed a passion for poetry and for the tales of chivalry. In 1361 he went to London to present to Queen Philippa a poem concerning the recent war between England and France. It secured for him a position as secretary to the Queen, who encouraged him to continue his work. In 1365 he made a journey to the Scottish Court at the expense and under the protection of Queen Philippa. In 1366 he left England in the train of the Black Prince, and in 1368 visited Italy under the protection of the Duke of Clarence. Upon the death of his patroness the Queen, in 1369, he returned to Valenciennes. Soon, however, he found new patrons who admired his writings. In 1370 he entered the service of Duke Wenceslas of Luxemburg. He was also befriended by Robert of Namur, to whom he dedicated the first book of his *Chronicles*, and by Guy of Châtillon, who, in 1373, appointed him curé of Lestines-les-Monts. For ten years he led an uneventful life, working upon his *Chronicles* or composing poems with Duke Wenceslas. In 1383 he became the chaplain of Guy of Châtillon, who had just inherited the County of Blois. Then for fifteen years Froissart traveled much, seeking men who could tell of the great wars in which they had taken part. Thus in 1388 he visited the Court of Gaston Phœbus at Béarn. To this journey we owe the striking description of this remarkable tyrant, whom Froissart admired. In 1394 he visited England a second time. Little is known of his life after he returned from England, and the date of his death is uncertain.

The work for which Froissart is famous is his four books of *Chronicles*, in which he recorded the events and wars of the last three-quarters of the ~~fourteenth~~ ^{fifteenth} century. He was engaged on this work for over forty years. He had little critical ability, and recorded supernatural tales with as much credence as he gave to knightly feats of arms. Nevertheless, he gives a masterly account of the character and manners of his age. He was able to describe most of the localities from his own knowledge, and he was fortunate in being able to consult important actors in every war which he described. Thus he learned of the Scottish wars from King David; of Crécy, from King Edward; of Poitiers, from the Black Prince; of the famous 'Great Companies,' from their commanders; of the death of Wat Tyler from Robert of Namur, who had been present.

In the first redaction of his first book he borrowed freely from Jehan le Bel's *Chronicle*. Later he made two revisions, and in each he deleted many of the portions borrowed from Jehan le Bel. One defect in his work, considered as an historical source, must be noted. Froissart was far from being impartial. In the first redaction of

his first book he was an English partisan. In the second redaction, undertaken at the wish of Robert of Namur, he suppressed much that was favorable to England. In the third redaction, which he made after 1400, when he was filled with grief for the murder of Richard II., the grandson of his former patroness, he made some very severe reflections on the English nation. The best editions of his *Chronicles* are those of Kervyn de Lettenhove (25 vols., Brussels, 1863-77) and Luce (Paris, 1869-88, incomplete), in the publications of the *Société de l'histoire de France*. There are many other editions and translations, for which see Potthart, *Bibliotheca Historica Medii ævi*, vol. i. (Berlin, 1896). Special mention should be made of the fine old English rendering by Lord Berners. Froissart is also noteworthy as a poet. He wrote many verses, which were greatly appreciated by his patrons. His first production was entitled *L'épînette amoureuse* ("The Little Thorn of Love"), and is an account of his boyhood and first love affair. The *Dit du Florin*, which is partly autobiographical, is the most pleasing of his poetical works. The most lengthy was his *Meliador*, which he read to Gaston Phœbus. It is a poem twice as long as the *Divine Comedy* of Dante, and is an echo of the tales of the 'Round Table'; but although it contains beautiful and interesting passages, as a whole it is exceedingly prolix and tiresome. It has been published by Longnon for the *Société des Anciens Textes* (3 vols., Paris, 1895-99). The other poems have been published by Scheler (3 vols., Brussels). For Froissart's life, consult the introductions to the two editions of his *Chronicles*, which have been cited, the secondary works given in Potthart, and especially Mary Darmesteter, *Froissart* (Paris, 1894).

FROLIC, THE. A British sloop of war captured in 1812 by the American sloop of war *Wasp*, under Captain Jacob Jones, who received a medal from Congress for the exploit.

FRÖLICH, frë'lik, LORENTZ (1820—). A Danish painter and engraver, born at Copenhagen. He studied in Dresden under Bendemann, and in Paris under Coutoure. Afterwards he lived much in France, and constantly exhibited at the Salons. His drawings and illustrations are especially successful and are widely known. Among his pictures are "Peasant Pursued by Wolves" (1838); "King Harold Blaataand" (1840); "Cupid and the Water-Sprite" (1845); and "Family of a Wood-God"; also some decorative paintings in the Court of Appeals at Flensburg, Prussia, and also in some public buildings of his native land.

FROLLO. A Roman knight, serving as Governor of France and killed by King Arthur, in an Arthurian legend of the fifteenth century, entitled *Arthur*, and other chronicles. He is also known as *Froll* or *Frolle*, and is mentioned in the first part of the ballad "King Arthur's Death," in Percy's *Reliques*.

FROLLO, CLAUDE. In Hugo's *Notre Dame de Paris*, the lover of Esmeralda and victim of Quasimodo, who hurls him from the cathedral tower. He is an archdeacon of Notre Dame, and practices mysterious forms of magic. Jehan Frollo is a student in the same work.

FROME, formerly FROME SELWOOD. An agricultural and manufacturing town in Somerset,

England, on the Frome, a branch of the Avon, 12 miles south-southeast of Bath, on the Great Western Railway (Map: England, D 5). Its staple products are broadcloths, silks, hats, ale, and cards for dressing woolen cloths. The town owns its water-works. The celebrated Selwood Forest, part of which still exists, was in the vicinity. Population, in 1891, 9600; in 1901, 11,000.

FROMENTIN, frô'mân'tân', EUGÈNE (1820-76). A French painter and author. He was born near La Rochelle, France, October 24, 1820. His father was a physician of note in La Rochelle, who had an inclination toward art, which he had cultivated, while a student in Paris, in the ateliers of Bertin, Gros, and Gérard. In November, 1839, at the age of nineteen, Eugène was sent to Paris to study law. He became also much interested in literature, and was associated intimately with eminent authors, as Benjamin Fillon, Michelet, Quinet, and Sainte-Beuve. He wrote much himself, and at this time formed the vivid and charming style so well known in his later works. Not until 1840, at the age of twenty, did Fromentin show any disposition toward painting. His first known sketch is a recollection of the presentation of the play of *Chatterton*, by Alfred de Vigny, at the Théâtre Français. It gives no promise of the talent which he developed later. In 1843 he received his license in law and began to study for the doctor's degree. At this time, partly under the influence of the depression attendant upon an attack of fever, he decided to abandon law. He first entered the atelier of a mediocre painter, named Remond, but a year later changed to that of Cabat. Fromentin occupied several studios in Paris, but finally settled in a little hotel in the Place Pigalle, which he occupied during the rest of his life. In 1846 occurred his first visit to Algeria. It was brief, and only a few sketches were brought back, but the main direction of his interest in life and art was then decided. Fromentin is essentially the painter of Northern Africa, the Sahara, and its oases. He first exhibited his Sahara pictures in the Salon of 1847. From this time on he was always either in the Sahara or in Paris.

Interest in Fromentin culminated in the Salon of 1859, when he received a first medal. The attention of Paris and the world had been especially awakened by his two newly published books: *Un été dans le Sahara*, which first appeared in the *Revue de Paris*, 1856, and *Une année dans le Sahel*, published in the *Revue des Deux Mondes*, in 1858. These two books were published together in 1879 by Plon, in a memorial edition, superbly illustrated with Fromentin's pictures of the Sahara. Fromentin published a novel, *Dominique*, in 1862. His most important literary effort is his critical work *Maîtres d'autrefois* (1871, a history of Dutch and Flemish painting). His paintings are characterized by brightness and harmony of color. Among the most important are: "A Farm Near La Rochelle" (1847), his earliest work; "Gazelle Hunt in the Hodna" (1857); "A Street in El-Aghouat," owned by the French Government; "An Arab Bivouac at Sunrise," in the collection of Mr. Edouard Delessert, Paris; "A Hunt with the Falcon" (1863), in the Louvre; and "An Arab Camp," his last picture, also in the Louvre. Several good examples of his works are in America,

notably in the Waters Collection, Baltimore, and in the Vanderbilt Collection, New York. Fromentin died suddenly at Saint-Maurice, near La Rochelle, August 27, 1876. Consult: Gonse, *Eugène Fromentin, peintre et écrivain* (Paris, 1881); Jouin, "Fromentin," in *Maîtres contemporains* (ib., 1887); Claretie, "Eugène Fromentin," in *Peintres et sculpteurs contemporains* (ib., 1882).

FROMMANN, frō'mān, GEORG KARL (1814-87). A German philologist, born in Coburg. One of his most important achievements was the revision of Luther's translation of the New Testament, which work he undertook in 1865 in association with ten other Protestant theologians. This revision was subsequently extended, at the request of the Protestant Conference, to the Old Testament; and the revised edition of the complete Bible appeared in 1892.

FROMMEL, frō'mēl, EMIL (1828-96). A German theologian and author. He was born at Karlsruhe, and studied at Halle, Erlangen, and Heidelberg. After holding several pastorates, he served as army chaplain in the Franco-German War of 1870-71, and in 1872 was appointed Court preacher at Berlin and pastor of the garrison in that city. His principal theological works include: *Die zehn Gebote Gottes in Predigten* (6th ed. 1898); *In drei Stufen*, an anthology (8th ed. 1890); *Festflammen* (6th ed. 1896); *Das Gebet des Herrn in Predigten* (4th ed. 1893). He also wrote tales and miscellaneous essays, collected and published under the title of *Gesammelte Schriften. Erzählungen für das Volk. Aufsätze und Vorträge* (1873-97).

FROMMEL, KARL LUDWIG (1789-1863). A German landscape painter and engraver, born at Birkenfeld, Oldenburg. He studied at Karlsruhe, under the Court engraver, Haldenwang, and went to Paris in 1809 to paint from nature for the Empress Josephine a cycle of twelve large landscapes in water-colors. He earned a considerable reputation during a prolonged stay in Italy (1812-17), was appointed professor at Karlsruhe after his return there, and became a very active promoter of several artistic enterprises. After a visit to London, in 1824, to acquaint himself with the technique of steel engraving, he opened at Karlsruhe a studio for that branch of art, and issued reproductions of well-known views in Italy which obtained a wide circulation. From 1830 to 1858 he was director of the picture gallery, which owes to his clever administration its present flourishing condition. In it are also preserved several of his attractive landscapes. Besides six original etchings, there are to be noted the engravings "Arricia Near Rome," "View of Tivoli," "Mount Vesuvius," and "Mount Etna," as some of the best among many commendable for characteristic conception and delicate execution.

FROMMEL-LINDEMANN, līn'de-mān, KARL AUGUST. See LINDEMANN-FROMMEL.

FROMONT JEUNE ET RISLER AÎNÉ, frō'mōn' zhēn à ré'slā' ā'nā' (Fr., Fromont Jr. and Risler Sr.). A novel by Alphonse Daudet (1874), the story of an ambitious bourgeoisie, Sidonie Chébe, who, after a marriage with the rich Risler, keeps up an intrigue with Fromont, and at last ruins her lover and the firm.

FROND (Lat. *frons*, OLat. pl. *frundes*, foliage). In botany, a term often used to designate the leaves of cryptogamous plants. It was originally introduced as distinctive of organs in which the functions of stem and leaf are combined, and was applied to the leaves of palms, etc. The term 'leaf' is now very generally used, even for mosses, ferns, etc., and the term 'thallus' for lichens. In algæ the term 'frond' is often used to designate the whole plant, except its organs of reproduction.

FRONDE, frōnd (Fr., sling). The name given to the period of domestic intrigues and political troubles in France during the minority of Louis XIV., from 1648 to 1653. The grasping and despotic policy of Mazarin had given offense to all classes. The princes and nobles saw themselves excluded from all high offices in the State, and their places filled by foreigners; the Parliament of Paris saw itself threatened in its political rights; and the people complained of the burden of taxes and administrative abuses. The Parliament, therefore, commenced a course of determined opposition, refusing to register the royal edicts, more especially the financial measures initiated by Mazarin. Among the leaders in opposition, in addition to the first president, Mathieu Molé, were the councilors Blancmesnil and Broussel. After Condé's victory over the Spaniards at Lens (August 20, 1648) had strengthened the hands of the Court party, violent measures were determined on, and on August 26, 1648, Blancmesnil and Broussel were arrested by order of Mazarin. The people took up arms, dispersed the Swiss Guard, and on the 27th of August erected barricades in the street around the Palais Royal. The Court now removed to Rueil, and after some negotiations yielded in so far that an ordinance was issued regulating the financial and judicial administration of the realm. This victory gave courage to the supporters of the Parliament, who continued to keep a sharp lookout on the Court, and were styled by the adherents of Mazarin *frondeurs*—i.e. censurers (literally, 'slingers'). The Court now resolved to suppress the movement, and on January 6, 1649, removed secretly to Saint-Germain, leaving Paris to be blockaded by the Prince of Condé with 7000 men. The Parliament, instigated by the astute Cardinal de Retz, and publicly supported by various nobles, including the Prince of Conti, the dukes of Longueville, Beaufort, Bouillon, and Elbeuf, and the Maréchal de la Mothe, called upon the people to resist. A sanguinary encounter at Charenton resulted in the defeat of the Frondeurs, and they were forced to enter into negotiations for peace. Accordingly, a treaty was made at Rueil, March 11, 1649, granting a general amnesty and regulating the matter of financial control. After the return of the Court to Paris in August, a new turn was given to the contest, the princes of the blood disputing the power with Mazarin. This, on January 18, 1650, led to the sudden arrest of Condé, Longueville, and Conti, which was the beginning of the new Fronde. The young sons of Louis XIII. were roused against Mazarin, and Marshal Turenne assumed the title of lieutenant-general of the royal army for the liberation of the princes. After some initial successes, Turenne, who was fighting in conjunction with the Spaniards, was finally completely defeated by Mazarin's

troops under De Plessis, near Rethel, on December 15, 1650. Mazarin returned to Paris, but found all parties against him, and his removal was insisted upon so urgently that he was obliged to release the princes and flee to the Netherlands. A system of intrigue was now substituted for force of arms, and the contest, which had begun for the interests of the people, was converted into a Court cabal. Turenne was gained over by the Queen Regent, Anne of Austria, De Retz by Cardinal Mazarin, and Condé, who had made himself generally odious by his haughty conduct, was obliged to flee for safety into Guienne. Louis XIV., who had now attained his fourteenth year, endeavored to induce Condé to return; but the latter, mistrusting the King's overtures, repaired to Bordeaux in 1651, where he had many adherents. There he commenced a regular war against the Court which might have had dangerous consequences had not Turenne opposed the Prince. On July 2, 1652, an engagement took place between the two parties in the outskirts of Paris. Condé was in danger of defeat, when, through the efforts of his friends, he was allowed to enter Paris. Paris itself, weary of these fruitless dissensions, now entered into negotiations with the Court, demanding, however, the final removal of Mazarin, who had meanwhile returned. This demand was complied with by Louis XIV., and the royal entry took place October 21, 1652. Various nobles were exiled as a result of the contest. Condé, who refused to enter into the compact, and had quitted Paris on October 15th, repaired to Champagne; and finally, finding no one disposed to take up arms in his cause, entered the Spanish service, and was declared a traitor. Mazarin returned to Paris, and was once more intrusted with the reins of government. Thus ended the period of the Fronde in Paris, for the last signs of revolt in the provinces were suppressed only in 1653. The defeat of the Frondeurs contributed to make Louis XIV. an absolute monarch. Consult: Saint-Aulaire, *Histoire de la Fronde* (Paris, 1860); Barante, *Le parlement de Paris et vie de M. Molé* (Paris, 1859); Perkins, *France Under Richelieu and Mazarin* (New York, 1888); Pardoe, *Louis XIV. and the Court of France*, etc. (London, 1888); *Memoirs of Cardinal de Retz* (London, 1896). See CONDÉ; LOUIS XIV.; RETZ, CARDINAL DE; TURENNE.

FRONSBERG, fróns'bèrk. See FRUNDSBERG, GEORG VON.

FRONSPERGER, fróns/pèrk-ër, LEONHARD (c.1520-75). A German writer on the art of war. He was born at Ulm, and began the study of military science in early boyhood. In his celebrated *Kriegsbuch kaiserlicher Kriegsgerechte und Ordnungen vom Geschütz* (4th ed. 1596; rendered into modern High German by F. W. A. Böhm, vol. i., 1819), he displays a remarkable knowledge of army organization, equipment, fortification, military law, articles of war, and artillery practice. He is generally considered the most competent German military writer of the sixteenth century.

FRONTAL BONE. See SKULL.

FRONT DE BŒUF, frôn de bœf. In Scott's *Ioanhoe*, a ferocious baron, who threatens Isaac the Jew in order to extort money. He is finally

burned to death with his castle when it is stormed by King Richard and Locksley.

FRONTENAC, frôn'tak', LOUIS DE BUADE, Comte de (c. 1621-98). The greatest of the Governors of New France. He was born in France about 1621. At an early age he entered the military service, and rapidly attained promotion. He became colonel at twenty-three and brigadier-general at twenty-six, and saw active service in Italy, Flanders, and Germany. In 1672 he was appointed to succeed De Courcelles as Governor of New France. Frontenac was choleric and arbitrary by nature, but extremely energetic, and sincerely ambitious to inaugurate an era of prosperity for Canada. His first act was to convene the three estates—Clergy, Nobles, and Commons—and to establish municipal government in Quebec. The royal policy, however, was adverse to the granting of extensive political rights to the Canadians, and the Governor's reforms in this direction were disapproved. He next became involved in controversies with the Jesuits, with the Intendant Talon, and with Perrot, the Governor at Montreal. These quarrels divided the colony into factions, and led at length to the recall of Frontenac in 1682. In 1689 he regained the King's favor, and was restored to his former position, which he held until his death, in November, 1698. Frontenac's first administration was especially marked by energy and tact in his dealings with the Indians, and by his encouragement of French explorations in the West. He aided Joliet, Marquette, and La Salle, and established posts at Mackinac, Niagara, and in the Illinois country. After his reappointment he waged a vigorous war against the Iroquois, who had reduced Canada to desolation, and against their allies and instigators, the English. The frontier towns of New England and New York were repeatedly ravaged by his punitive expeditions. His most signal achievement in these campaigns was the show of force by which he foiled Sir William Phips's fleet before Quebec in 1690. At different times he might have made peace with the Iroquois if he had been willing to abandon to their vengeance his Algonquin allies; but this he steadfastly refused to do, and it was not until his last campaign in the Mohawk country in 1696 that the Iroquois were brought to sue for peace. Consult: Winsor, *Cartier to Frontenac* (Boston, 1894); and Parkman, *Frontenac and New France Under Louis XIV.* (Boston, 1877).

FRONTERA, frôn-tä'rá. A seaport in the State of Tabasco, Mexico, 230 miles east by south of Vera Cruz; near the mouth of the Grijalva River on the Gulf of Campeachy. It is the port of San Juan Bautista, the capital of the State, and has a good harbor; its exports, which have an annual value of about \$400,000, comprise coffee, cocoa, and dyewoods. Frontera is the residence of a United States consular agent. Population, about 3000.

FRONTIER, MILITARY. The furthestmost limits of military lines of national defense, observation, and concentration. By the mutual consent of countries contiguous to each other, the military frontier is usually placed some little distance back of the actual geographical dividing line. The sentries of England and Spain at Gibraltar are separated by a strip of

land agreed upon as neutral territory. With the principal military countries of Europe the various mobilization schemes are designed to secure the greatest possible concentration on the frontier, where they are knitted together by a more or less complete system of forts or intrenched camps. Both France and Germany keep their frontier corps at a much higher peace strength than the remainder of their armies. The most important British Indian camps of exercise, as well as their strongest points of concentration, are along the military frontier of Northwestern British India. The *Militärgrenze*, or military frontier, was the former name of a narrow strip of land along the Turkish frontier in Hungary and Croatia-Slavonia, which had a special military constitution. See FORTIFICATION; MOBILIZATION.

FRONTINO, frôn-tě'nó. The horse of Rogero, in Ariosto's and Boiardo's *Orlando*. He received it from Brunello, who in turn had stolen it from Sacrepant. When mounted on it Rogero was invincible.

FRONTINUS, SEXTUS JULIUS. A Roman author, who flourished in the second half of the first century A.D. In A.D. 74 he was sent to Britain as Governor of that island, and obtained a great reputation by his conquest of the Silures, and his vigorous maintenance of the Imperial authority. He appears to have been twice consul in the course of his life, and to have held several other important offices, notably that of *curator aquarum*, or water commissioner. He died about A.D. 105. Several works are attributed to Frontinus, only two of which are certainly genuine, the *Strategematica*, a treatise on the art of war, in three books; and the *De Aquis Urbis Romæ*, in two. The latter is a highly important technical account of the Roman aqueducts, and the marvelous water supply of the ancient city. There is an edition of the *Strategematica*, by Gundermann (Leipzig, 1888); and of the *De Aquis*, by Herschel, in *Two Books on the Water Supply of the City of Rome* (Boston, 1899), including the text, translation, and commentary.

FRONTISPIECE (from OF. *frontispice*, ML. *frontispicium*, front view, from Lat. *frons*, front + *specere*, to look). The name generally given to an engraved and decorated title-page of a volume, or an engraving or other illustration placed opposite the title-page. The term was formerly used in architecture to denote the front or principal face of a building.

FRONTO, MARCUS CORNELIUS. A teacher and author. He was born at Cirta, in Numidia, and came to Rome in the reign of the Emperor Hadrian, where he soon obtained a high reputation as a teacher of eloquence. Antoninus Pius intrusted to him the education of Marcus Aurelius and Lucius Verus, both of whom always retained the warmest admiration of their preceptor. Fronto gradually rose to the highest offices of the Empire, became very wealthy, and died, it is thought, about A.D. 175. Until recently nothing was known of Fronto as an author, except from a few fragments of a grammatical treatise (*De Differentiis Vocabulorum*); but in the year 1814 Angelo Mai discovered in the Ambrosian Library at Milan a palimpsest, which, being deciphered, was found to contain a considerable number of Fronto's letters with some short

essays. These were published by Mai in 1815; and in the following year an edition was published at Berlin by Niebuhr, who wrote a critical preface, and also printed the commentaries of Buttmann and Heindorf. A few years afterwards Mai found in the library of the Vatican at Rome another palimpsest containing more than 100 of Fronto's letters, including his correspondence with the Emperor and with his royal pupils. The result was a new edition by Mai (Rome, 1823), embodying the new discoveries. The contents of these letters are on the whole unimportant, although they help to confirm the good opinion which history has formed of the Emperor Marcus Aurelius. The best edition is by Naber (Leipzig, 1867).

FRORIEP, frô'rêp, ROBERT (1804-61). A German physician, born at Jena, and educated at Bonn. In 1833 he received a call to the Pathological Museum of the Charité at Berlin, of which he was director for nearly thirteen years. His medical and surgical atlases are widely known. They include: *Chirurgische Kupfer tafeln* (96 parts, 1820-47); *Klinische Kupfer tafeln* (12 parts, 1828-37); *Atlas der Hautkrankheiten* (1837); *Pferderassen* (6th ed. 1874); and *Atlas Anatomicus* (6th ed. 1877). His treatise *On the Therapeutic Application of Electro-Magnetism in the Treatment of Rheumatic and Paralytic Affections* (English translation by R. M. Lawrence, 1850) was a very important contribution to electro-therapy in its day.

FROSCHDORF, frôsh'dôrf. See FROHSDORF.

FRÖSCHL, frësh'l, KARL (1848—). An Austrian genre and portrait painter, born in Vienna. He studied first at the Academy of his native city, then under Wilhelm Diez in Munich, whither he returned after a sojourn of two years (1874-76) in Italy. In 1884 he settled again in Vienna, became very popular through his attractive and humorous scenes from child-life, and was much sought as a portrait painter by members of the Imperial family and aristocracy. His female portraits in pastel are particularly successful. Reproductions of his child-life scenes are embodied in the collections *Goldene Zeitung* (Munich, 1882) and *Fröschl-Album* (Leipzig, 1890).

FROSINONE, frô'zè-nô'nâ. A city in South Italy, 53 miles southeast of Rome, near the junction of the River Cosa with the Sacco. There are ruins of the ancient Hernican Frusino, and large quantities of wine are marketed. Population of commune, in 1881, 10,000; in 1901, 11,191.

FROSSARD, frô'sâr'. CHARLES AUGUSTE (1807-75). A French general. He was born at Versailles, studied at the military school at Metz, and served with distinction in the army. He participated in the siege of Rome in 1849, commanded the Second Engineer Corps in the Crimean War, and in 1855 was promoted to be brigadier-general. He was chief of the engineering department during the Italian campaign of 1859, and was afterwards made an officer of the Legion of Honor, and appointed Governor of the Prince Imperial. In the war with Germany he commanded the Second Corps of the Army of the Rhine, and headed the attack upon Saarbrücken (August 2, 1870). He was taken prisoner at Metz, and was detained until the close of the war. He published a *Rapport sur les*

opérations du deuxième corps de l'armée du Rhin dans la campagne de 1870 (1872).

FROST (ME. *frost*, *forst*, AS. *forst*, from *freosan*, Eng. *freeze*). A formation of ice on the ground or on plants; also the temperature 32° Fahrenheit or 0° Centigrade that corresponds to the formation of ice and snow. When air whose dew-point is below 32° Fahrenheit comes in contact with a substance whose surface is colder than this, a portion of the aqueous vapor in the air is condensed upon that surface in the form of ice or frost; although this deposition is truly ice, yet the particles of ice are usually small, separate from each other, and reflect the rays of light in such a way as to make the deposit appear white, like crushed ice, instead of being transparent, as is the case with solid ice. In fact, the particles of ice usually have a crystalline structure, more or less perfect, as may easily be seen when moisture is deposited on the inside of a window-pane when the temperature outdoors is below freezing. In the latter case, when the air within the room has a dew-point far above the freezing temperature, the moisture first condenses in drops of dew upon the pane of glass, but is afterwards frozen into ice if the exterior cold is sufficiently intense.

When the air of the room has a dew-point below the freezing temperature, then the moisture is deposited upon the window-pane directly in the form of spiculæ or slender prisms of ice, and it is under these circumstances that the most delicate frost figures are formed. The latter is also the ordinary case in the formation of frost on vegetation and on the ground in the open air; in such a case every object is studded more or less thickly with small crystals of ice; the whole deposit is as white as snow, and is usually called 'hoar frost.' It frequently happens that rain (or sleet, which is frozen rain) falls on objects that are already colder than 32° Fahrenheit. In such cases the rain or sleet remains congealed as a layer of almost transparent ice on the upper surfaces of the limbs, the leaves, the fences, and other objects. This usually happens when rain falls at the close of a period of very cold weather. On the summits of high mountains, notably Mount Washington and the mountain stations of Southern Europe, it frequently happens that although the air is apparently clear, yet it is filled with the most minute drops of water, which are cooled far below the freezing-point, but retain their liquid condition. When these strike any object they lose their spherical shape, and are converted immediately into ice at the temperature of thirty-two degrees. They therefore build up an accumulation of ice on the windward side of every object, giving rise to remarkable displays of so-called 'frostwork.'

Aëronauts have occasionally ascended into and through thin layers of air bearing similar aqueous globules that are cooled below freezing, but still liquid water. These layers appear from a distance like thin stratus clouds, but are scarcely perceptible when viewed directly from below on account of their transparency. The globules instantly change to snowflakes or frostwork when they strike any object.

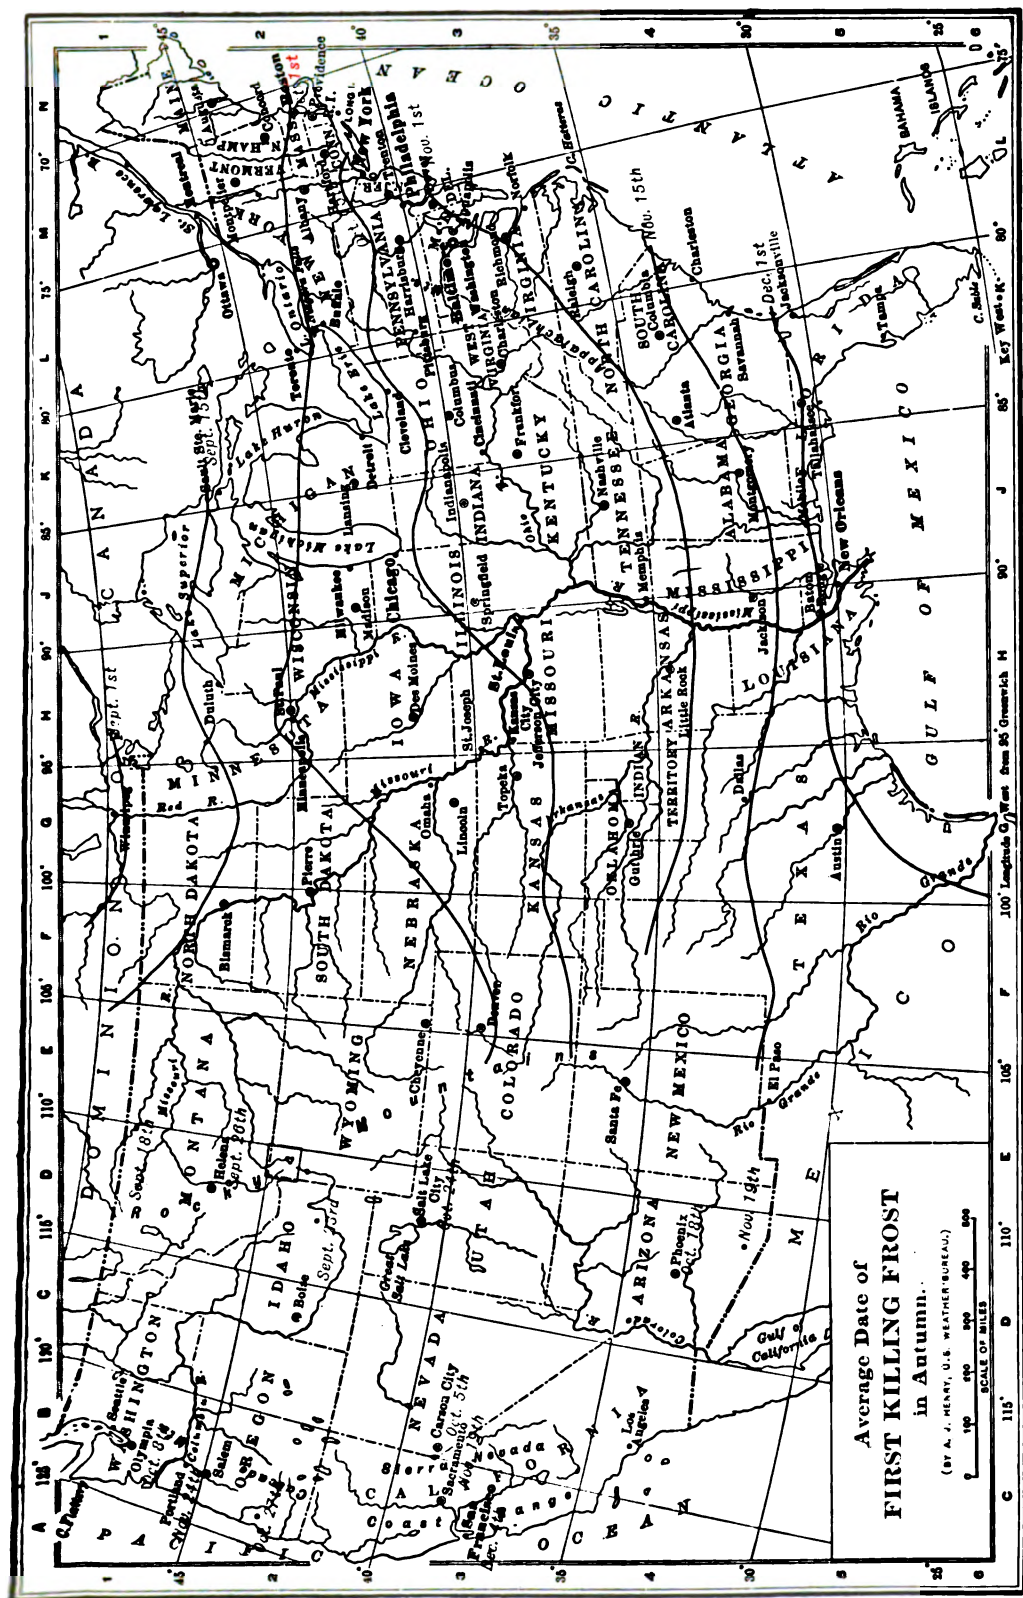

Tender vegetables in northern gardens and tropical plants in the southern portion of the United States and in California are severely injured or

killed by freezing temperatures. The mere deposition of frost on the outside of such plants does not necessarily argue that the plant is frozen through and through; it may, therefore, produce only slight damage; on the other hand, when the air is too dry to deposit much moisture, and when it deposits frost only when cooled greatly below 32° Fahrenheit, it often happens that the plants are frozen under a clear sky or during a cold, dry wind without the deposition of much, if any, frost upon their exterior surfaces; in such cases the sap within the cells and especially within the medullary rays is frozen; the structure of the plant is destroyed, and when the sun's warmth has melted the frozen sap, the leaves and stalks sink to the ground, wilt away, and turn black, being in fact dead. This phenomenon is known as the black frost. It is, however, more properly a freeze than a frost.

The interval between the last frost of spring and the first frost of autumn is the so-called growing season of the agriculturists. Between these dates tender plants of all kinds must perfect their crops, while those that can withstand frosts continue their growth uninterruptedly. Especially must the great staple crops of the country—the Indian corn or maize, the cotton, tobacco, and a large range of tender fruits, as well as spring wheat, rye, and buckwheat—all complete their growth between these dates. The accompanying maps show by curved lines the regions in the United States over which the first and last frosts occurred on given dates on the average of the past thirty years. A comparison of these maps will therefore show the length of time that is available as a normal growing season in any part of the country. Although agriculturists always select seed that is likely to produce a quick-growing crop that may be harvested before the early frost of autumn, yet, owing to the irregularities of climate, the late spring frosts and the early autumn frosts frequently bring their crops into jeopardy. This has stimulated the invention of many methods of frost protection, which are fully described in the *Monthly Weather Review* for the years 1894-97, and especially in *Bulletins on Frost Protection*, Nos. 23 and 29, issued by the Weather Bureau.

The methods of frost protection are divided into several categories, as follows: (1) A light screen of any material, even a few slats or a gauzy veil, stretched above a plant prevents the radiation of the plant's heat into space, and by reflecting back the heat from the soil may keep the temperature of the plant so high as to prevent frosty temperatures. (2) Fires with clouds of smoke warm the air of a field while the smoke cloud prevents radiation; in perfectly still air such a cloud of smoke will spread evenly in all directions, and continue effective through the night. (3) Without reliance upon a cloud of smoke, one may warm the ground and the air either by fires, or by streams of water, or by flooding the field. All these methods and various combinations of them are in regular use for the protection of tropical fruits in California and Florida, and for the protection of tobacco, cranberries, and early vegetables in Northern States. Many patented devices for making smudges are on the market, but in general the smudge disfigures the fruit, and other protective devices are preferred.

Although the tender portions of plants are

destroyed by frost, yet the ripened mature seed is much less susceptible. The kernels of both corn and wheat may be subjected to very low temperatures without being injured. Unfortunately, many of the bacterial germs and fungoid spores also are not injured by cold. It was formerly supposed that freezing weather destroyed the germs of malarial and yellow fever; but it is now probable that such germs are not affected by cold, but that, on the other hand, the cold checks the mosquitoes and other insects by which these germs are introduced into the human body.

The prediction of frost is a matter of great importance to a farmer, and can usually be made with great exactness by the help of the daily weather map, wherefore special attention is paid to this subject by the officials of the Weather Bureau. All persons whose interests depend largely upon the knowledge of frost keep in close touch with the Weather Bureau, and receive special telegrams when freezing temperatures are approaching. In general, when the dew-point is below 32° F. and the night is still and clear, the temperature will fall rapidly, and it may reach the freezing-point before sunrise.

Inasmuch as severe frosts have sometimes been very destructive to the staple crops, they have occasionally been the direct cause of severe famines; lists of memorable frosts for the last four hundred years will be found in Andrews, *Famous Frosts and Frost-Fairs in Great Britain* (London, 1887); also Walford, paper on "Famines" in *Journal of the Statistical Society* (London, 1878). The record for the United States will be found most conveniently in Pierce on *The Weather* (Philadelphia, 1860), and in the successive numbers of the *Monthly Weather Review* (Washington).

A special and elegant form of frostwork occurs as 'ice needles' or 'ice columns,' that rise up in masses from gravelly ground, raising up the top layer of gravel and small stones on their summits to a height of two, four, or six inches. These ice columns are hollow, and are apparently formed by the freezing of the films of moisture that rise up from the lower warm wet soil and freeze on the under side of the top layer of stones when the latter are chilled by radiation during clear nights. These columns do not form when the air is cold enough to freeze the soil below the top layers. A similar formation exudes from a thin crack in the bark of a tree when the warm body of the tree affords sap enough. The mechanics of this process is partially explained by Prof. Cleveland Abbe in the *American Meteorological Journal* for April (1893).

FROST, ARTHUR BURDETT (1851—). An American caricaturist and illustrator. He was born at Philadelphia, January 19, 1851. At fifteen years of age he was for six months in an engraver's employ. He became a lithographer, and afterwards studied in the Philadelphia Academy of Fine Arts under Thomas Eakins. Subsequently he worked for the *New York Graphic*. In 1876 he entered the studio of Harper & Brothers, and was associated with Abbey, Reinhart, and Alexander. In 1877-78 he worked in England. Frost's works show thorough draughtsmanship. Honesty is the principal characteristic of the artist. He draws all the elements that compose the picture with equal interest and sympathy.

His first illustrations for a volume, entitled *Out of the Hurly-Burly*, attracted much notice. Other important illustrations are found in Stockton, *Rudder Grange* (1879); Octave Thanet, *Stories of a Western Town* (1893); Bunner, *Stories of a New York House* (1887). Publications of his own are: *Stuff and Nonsense* (1888); *Bull Calf, and Other Tales* (1892); *Golfer's Alphabet; Sports and Games in the Open*.

FROST, JACK. See JACK FROST.

FROST, JOHN (1800-59). An American compiler. He was born in Kennebunk, Maine; graduated at Harvard, and taught in Boston and Philadelphia. He published a great number of works, comprising school and juvenile books, and historical and biographical compilations, among which may be mentioned: *Pictorial History of the United States* (2 vols., 1844), which was exceedingly popular; *Picture History of the World; Lives of American Generals; and Lives of American Naval Commanders*.

FROST, PERCIVAL (1817-98). An English mathematician, born at Hull. He attended school at Beverley and Oakham, and in 1835 entered Saint John's College, Cambridge. Although as a boy he showed great aptitude for classics, at Cambridge he devoted his attention chiefly to mathematics. He was made a fellow of Saint John's in 1839, and on his marriage in 1841 he became tutor in mathematics, among his pupils being, somewhat later, W. K. Clifford. He held a mathematical lectureship at Jesus College for twelve years, and afterwards at King's College for thirty years, becoming Fellow of King's and taking his degree of Sc.D. (Camb.) in 1882. His chief works were *A Treatise on the Principia* (1854); *A Treatise on Solid Geometry* (with Wolstenholme, 1863); and *A Treatise on Curve-Tracing* (1872). Consult Taylor's biographical note in the *Proceedings of the London Mathematical Society*, vol. xxix. (London, 1898).

FROST, WILLIAM EDWARD (1810-77). An English painter. He was born at Wandsworth in September, 1810, and studied at the Royal Academy. At first he painted portraits; but, under the influence of Etty, devoted himself to mythological subjects. In 1839, he exhibited "Prometheus Bound," for which he received the Academy's gold medal. In 1847 he won a competition prize by his cartoon, "Una Alarmed by the Fauns." Among his works are the "Bacchanalian Revel" and "Disarming of Cupid" (1850), in the King's possession; "Narcissus" (1857); "Hylas and the Nymphs" (1867); and "Masidora" (1871). He died in London, June 4, 1877.

FROST-BIRD, or FROST-SNIPE. An American gunner's name for the stilt sandpiper (*Micropalama himantopus*). See STILT; and Plate of BEACH-BIRDS.

FROSTBITE. A term usually applied to local effects of cold, although it may be properly used to designate all results of low degrees of temperature, from chapped hands to freezing to death (*asphyxia congelatorum*). The frostbitten part is at first pale, cold, tingling, and numb; then strong, stiff, with loss of sensation and motion; later, shrunken, hard, even brittle, livid and mottled from coagulation of blood in the veins. Molecular death occurs, the blood-corpuscles disintegrate, sloughing and mortification

result, and a line of demarcation is established. (See GANGRENE.) Although a sudden violent application of cold may cause death of the tissues by reducing the temperature to a degree incompatible with animal life, the most common cause of the destructive effects of moderate frostbite is perhaps the excessive reaction which occurs on sudden removal of the cold, or the application of heat; this is especially the case with moist cold.

Most cases of frostbite are very trifling, the most common being chilblains. (See CHAPPED HANDS and CHILBLAINS.) The treatment of frostbite is most prudently effected by friction, at first with snow, then with ice-water, and then with water at ordinary temperature, no warmth being applied for some time. If the frozen part is brittle, spraying with ice-water must be substituted for rubbing with snow. As the coldness subsides, the painful tingling and then redness and heat return; in a short time the heat is above the normal, and a febrile reaction sets in. Partial recovery may always be expected unless the freezing has been continued too long. When sloughing begins it is necessary to employ supportive and stimulative treatment, with hot fomentations, turpentine dressings, carbolized-oil applications, etc., as adjuvants. After the line of demarcation is established, amputation should be performed by a surgeon. Eczema and pruritus may follow moderate frostbite. Partial paralysis of the parts supplied by the facial and radial nerves, or even hemiplegia, may follow. The use of alcoholic drinks when exposed to cold is a fatal mistake. The drug brings heat to the surface of the body, where it is rapidly lost, and the vitality of the individual is lowered. Alcoholism contributes forcibly to a fatal result in comparatively mild frostbite, from which temperate persons would quickly recover.

FROSTBURG. A town in Allegany County, Md., 163 miles southeast of Pittsburg, Pa.: on the Cumberland and Pennsylvania Railroad (Map: Maryland, B 2). It is picturesquely situated at an elevation of about 2200 feet, and is a summer resort. It is the seat of a State normal school. Frostburg has large fire-brick works, planing-mills, foundries, etc., but is engaged chiefly in coal-mining. The government is administered under a charter of 1870, which provides for a mayor, chosen annually, and a city council elected at large. The water-works are owned and operated by the municipality. Population, in 1890, 3804; in 1900, 5274.

FROSTFISH. (1) A slender, scaleless, pelagic fish (*Lepidotus caudatus*), elsewhere known as scabbard-fish, but called frothfish in New Zealand, where it visits the coast to spawn at irregular intervals, and is much sought after as a delicacy by a strange method of capture. It has the extraordinary habit, in winter, of coming ashore alive on certain sandy beaches, where it wriggles on to the firmer sands above the surf-line, there to die or be quietly devoured by some animal. No satisfactory reason has yet been assigned for this suicidal proceeding, but it is taken advantage of by the 'fisherman.' When the night is clear and calm, with comparatively low surf, as well as frosty, the fish may be expected: and then parties of men go to the beach shortly before daybreak (or perhaps

camp there overnight and rise early), and walk back and forth, seizing the fish as they come floundering out of the surf and killing them.

(2) In New England, a tomcod (q.v.).

FROTH-FLY, FROTH-HOPPER, FROG-FLY, or FROGHOPPER. Insects of which the young—larvæ and pupæ—are found in a frothy exudation on plants. They form the family Cero-copidæ of homopterous bugs, and are allied to aphids, and still more nearly to cicadas and lantern-flies. The larvæ and pupæ differ little in appearance from the perfect insect, except that the latter possesses four large wings. The froth, commonly called frog-spittle, is believed to be composed of sap which the insect sucks up through its proboscis. The sap passes through the intestine and is emitted as a clear mass, into which the insect draws bubbles of air by means of its tail claspers, and thus makes foam. When the insect is about to transform, the foam dries in such a way as to produce a shelter for the ensuing quiescent stage. The most common one in the Eastern United States is *Aphrophora quadrangularis*. Some of the tropical forms assume very bizarre shapes, caused by outgrowths from the thorax. The fluid is emitted by some species in drops which may be thrown a considerable distance, causing the phenomenon known as weeping trees. A few dozen larvæ of a Madagascar form may exude a quart of fluid in an hour and a half. Frog-spittle is supposed to be produced as a protective covering for the young insect, but in spite of it certain Hymenoptera pick the larvæ out and carry them off to be stored as food for their larvæ. The winged stage is a much flattened one and capable of long leaps, whence the name 'froghopper,' first given to them because they came from the 'frog-spittle,' is doubly appropriate.

FROTHINGHAM, frôth'ing-am, ARTHUR LINCOLN (1859—). An American archaeologist and educator, born in Boston, Mass. He studied at the Catholic Seminary of San Apollinare, Rome, Italy; the Royal University of Rome, and the University of Leipzig (Ph.D., 1883); was fellow in Semitic languages and lecturer in archæology at the Johns Hopkins University in 1882-86; in 1887 was appointed to the Princeton chair of archæology and the history of art, and in 1898 became professor of archæology and ancient history. In 1884 he was secretary of the Archæological Institute of America; in 1885 founded *The American Journal of Archaeology*, of which he was owner and editor until 1896; and in 1895-96 was an associate director of the American School of Classical Studies at Rome. His publications include contributions to periodicals, monographs on sculpture and painting: *Stephen Bar Sudaili, the Syrian Mystic and the Book of Microtheos* (1886); and (with A. Marquand) *A Text-Book of the History of Sculpture* (1896). He prepared articles on architecture for *The New International Encyclopedia*.

FROTHINGHAM, ELLEN (1835-1902). An American translator, the daughter of Nathaniel Frothingham. She was born in Boston. She made a special study of German literature, and is well known for her translations into English of Lessing's *Nathan der Weise* (1868); Goethe's *Hermann und Dorothea* (1870); Auerbach's *Edelweiss* (1871); and Lessing's *Laokoon* (1874),

FROTHINGHAM, NATHANIEL LANGDON (1793-1870). An American clergyman and writer. He was born in Boston, and graduated at Harvard in 1812, where he subsequently became the first professor of rhetoric and oratory. In 1815 he was ordained pastor of the First Church (Unitarian), in Boston, which position he occupied until 1850, when he left the pulpit, and devoted himself to literature. He published: *Sermons in the Order of a Twelvemonth* (1852), and *Metrical Pieces, Translated and Original* (1855). He also contributed largely to periodical literature, and was a thorough student of German, when such scholarship was rare in America. His biography was written by his son, Octavius Brooks Frothingham.

FROTHINGHAM, OCTAVIUS BROOKS (1822-95). An American Unitarian clergyman. He was born in Boston, November 26, 1822, a son of Rev. Nathaniel Langdon Frothingham. He was graduated at Harvard College in 1843, at the Cambridge Divinity School in 1846, and was settled as pastor of the North Church (Unitarian), Salem, Mass., in 1847. In 1855 he became minister of a church in Jersey City, N. J., where he remained four years. In 1859 he accepted a call to the pastorate of the newly formed Third Unitarian Congregational Church in New York, and remained at that post for twenty years, when ill health compelled his resignation. From the beginning he belonged to the most radical wing of the Unitarians, and the name of his church was finally changed from the 'Third Unitarian' to the 'First Independent Liberal Church of New York,' the connection with the Unitarian denomination being thereby sundered. After 1881 he resided in Boston, and devoted himself to literary work. He died November 27, 1895. Frothingham was one of the founders of the 'Free Religious Association,' and its president for the first twelve years of its existence. He ranked high as a scholar, and as a preacher was impressive and eloquent. He contributed largely to the periodical press, on a great variety of subjects, and published more than two hundred sermons. Other works worthy of mention are: A translation of Renan's *Studies of Religious History and Criticism* (1864); *History of Transcendentalism in New England* (1876); *History of Boston Unitarianism from 1820 to 1850*, including a memoir of his father (1890); and lives of Theodore Parker (1874), Gerrit Smith (1878), George Ripley (1882), William Henry Channing (1886), and David Atwood Wasson (1889).

FROTHINGHAM, RICHARD (1812-80). An American journalist and historical writer, born in Charlestown, Mass. He was a member of the State Legislature in 1839, 1840, 1842, 1849, and 1850; was Mayor of Charlestown in 1851-53; was a delegate to the National Democratic Conventions of 1851, 1852, and 1876; and from 1852 to 1865 was managing editor of the *Boston Post*, of which he was also for many years a proprietor. He devoted much of his time to historical study, and published, in addition to pamphlets and magazine articles, a *History of Charlestown* (1848); *History of the Siege of Boston* (1849); *Life and Times of Gen. Joseph Warren* (1865); and *The Rise of the Republic of the United States* (1871), his most important work.

FROTTOLA, fröt'tò-là (It., ballad). A kind of Italian folk-song, much cultivated in the six-

teenth century. It was midway between the very simple villanella (q.v.) and the more elaborate madrigal (q.v.). Between 1504 and 1509 Petrucci published nine books of Frottole. The words were generally of an erotic character.

FROUDE, FRÖD, JAMES ANTHONY (1818-94). An English historian, litterateur, and educator. The youngest son of Robert Hurrell Froude (1771-1859), Archdeacon of Totnes, he was born at Dartington, Devonshire, April 23, 1818. He was educated at Westminster School, and at Oriel College, Oxford, where in 1840 he obtained a second-class in classics, and in 1842 graduated B.A., won the Chancellor's Prize for an English essay, and was elected a fellow of Exeter College. He graduated M.A. in 1843, and to retain his fellowship took deacon's orders in 1844, which the Clerical Disabilities Act enabled him to relinquish in 1872. For, influenced by the Tractarian movement, of which his brother Richard Hurrell Froude and Newman were leaders, his views changed, and his early works, *The Shadows of the Clouds* (1847), published under the pen-name of "Zeta," and the *Nemesis of Faith* (1848), being condemned by the University authorities, he resigned his fellowship, also an appointment as head-master of the Hobart High School, Tasmania, abandoned the clerical profession, and devoted himself to historical study and literature. He wrote for the *Westminster Review* and other periodicals, including *Fraser's Magazine*, of which he subsequently became editor, and in 1856 appeared the first volume of *The History of England from the Fall of Wolsey to the Defeat of the Spanish Armada* (12 vols. 1856-1870), on which his fame chiefly rests. In 1869 he was elected rector of Saint Andrews University, and received the degree of LL.D. The preparation and publication of his important historical and biographical works were relieved by intervals of travel and lecture. In 1872 his lectures in the United States on the relations between England and Ireland, in which, arguing from historical parallels, he scoffed at all attempts to conciliate the Irish, involved him in an animated controversy with the Dominican Father Thomas Burke. In 1849 Froude married Charles Kingsley's sister-in-law, Charlotte Maria, fifth daughter of Pascoe Grenfell. She died in 1860, and seventeen months later he married Henrietta Elizabeth, daughter of John Ashley Warre. Upon her death, in 1874, he resigned the editorship of *Fraser's Magazine*, and in 1874, and again in 1875, was sent by the Earl of Carnarvon, Secretary of State for the Colonies, to the Cape of Good Hope to investigate the plan of South African federation. The result of these missions was singularly unfortunate and disastrous to Lord Carnarvon's policy, owing to Froude's tactless speeches and representations. In 1884-85 he visited Australia, and in 1886-87 the West Indies; he wrote accounts of these two visits, which were violently assailed by colonial writers as biased and misleading. As Carlyle's personal friend and literary executor, he edited his *Reminiscences* (2 vols., 1881), Mrs. Carlyle's *Letters and Memorials* (1883), and *Thomas Carlyle: A History* (4 vols., 1882-84), but their copious personal criticism excited much discussion as to Froude's editorial discretion. In 1892 he succeeded Edward A. Freeman (q.v.), one of his most caustic critics, as regius professor of

modern history at Oriel College, Oxford. Froude died at Salcombe, Devon, October 20, 1894. Besides the works already mentioned, his writings include: *The English in Ireland in the Eighteenth Century* (3 vols., 1872-74); *Short Studies on Great Subjects* (2 vols., 1877-82); *Cæsar* (1879); *Two Lectures on South Africa* (1880); *Oceana* (1886); *The English in the West Indies* (1888); *The Two Chiefs of Dunboy* (1889), an historical romance; *Life of Lord Beaconsfield* (1890); *Erasmus* (1894); and *Elizabethan Seamen* (1895). Froude was afflicted with constitutional sentimentality and an unfortunate, if unconscious, facility for inaccurately adapting facts to suit the views he sought to promulgate. His partisan glorification of Henry VIII. as the disinterested and magnanimous executor of the public wish in regard to ecclesiastical reform is one of the most striking examples. Hence the frequent storms of protest and criticism that his writings evoked, and the blemishes of his otherwise splendid works. For, although he at times subordinated accuracy to the exigencies of descriptive, vivid, and emphatic writing, and justified his action on the score of dramatic effect, the lucidity and beauty of his style make his works rank among the finest examples of English prose of the nineteenth century, and have earned for his *magnum opus* an imperishable position in the chronicles of British history. Of Froude there is yet no biography. Consult: the *London Times* for October 22, 1894; the introduction to Wheeler's edition of *Historical and Other Sketches* (New York, 1883); Birrell, in *Scribner's Magazine*, xvii., 149; Goldwin Smith, in *North American Review*, clxi., 677; Stephen, in *National Review*, January, 1901; Godkin, in the *Nation*, liv., 318; and Conway, in same, lix., 378, 401.

FROUFROU, frōō'frōō'. A five-act comedy, the most celebrated work of Meilhac and Halévy, produced at the Gymnase in 1869. The heroine, Gilberte, a high-spirited girl, called Froufrou, is spoiled first by her father, then by her husband, whom she deserts for a lover. She returns at last, is pardoned by her husband, and dies in his house. The play has enjoyed great success.

FROZEN STRAIT. A passage leading northwest from Fox Channel, the northern continuation of Hudson Bay, toward Repulse Bay (Map: Canada, O 3). It separates Southampton Island from Melville Peninsula. It is 15 miles wide, and although in the 66th degree of latitude, is nearly always ice-bound and inaccessible to navigation.

FROZEN WELLS. Wells in which ice is found either with or without water. They occasionally occur in the United States and Europe. A famous one in Brandon, Vt., was sunk through a mass of frozen ground fifteen feet thick, and formerly showed ice at fourteen feet below the surface in the summer time. In most frozen wells the ice lasts until late summer, and the temperature is seldom above the freezing-point. The low temperature and ice were originally attributed to the fact that the well pierces a stratum of glacier drift in which ancient glacier ice still survives, but the researches of Kimball have shown that this extreme hypothesis is quite unnecessary. He has demonstrated that the low temperatures in frozen wells, ice-caves, and similar situations are due to the percolation of cold

air into the interior of the earth during cold winter weather and the coldest hours of the morning. He has shown that the deserted iron-mines at Westport, New York, give a complete key to the method of formation of ice in caves and wells. Consult *United States Monthly Weather Review* (Washington, 1901). See ICE-CAVES.

FRUCTIDOR, fruk'ti-dōr' (Fr., from Lat. *fructus*, fruit, Gk. δῶρον, *dōron*, gift). The twelfth month of the French Republican calendar. It ran from August 18th to September 16th in the years I.-VII. and from August 19th to September 17th in the years VIII.-XIII., being followed by five supplementary days, known as *sans-culottides*, which filled out the year. The 18th Fructidor, Year V. (September 4, 1797), is celebrated as the day on which Barras, Rewbell, and La Révellière, members of the Directory, by a coup d'état, expelled their colleagues Carnot and Barthélemy, and saved the Republic from the machinations of the party of reaction, who had obtained the upper hand in the Council of Five Hundred. See FRENCH REVOLUTION.

FRUCTOSE. See SUGARS.

FRUGAL, LUKE. The villain of the two brothers whose temperaments are contrasted in Massinger's *City Madam*. His brother John's generosity is set over against his hypocrisy, much as Sheridan contrasts the brothers Surface.

FRUGONI, frōō-gō'nē, CARLO INNOCENZIO MARIA (1692-1768). An Italian poet of the Arcadian coterie, remarkable mainly for his power of improvisation, in virtue of which he was one of the most indefatigable writers of occasional verse in his time. Born at Genoa, November 21, 1692, he became a cleric, a teacher of rhetoric in various places in Italy, and poet laureate at the Court of Parma. He seems to have taken monastic vows rather under compulsion than of his own accord, and he found them so irksome that Pope Clement XII., at the instance of Cardinal Bentivoglio, had him released from the rigid obligations of life in the cloister, though, of course, not from his sacerdotal duties.

Frugoni represents the third rhyming manner of the Arcadian Academy, a school of Italian writers, which was founded in 1692, and whose activity ended with our author. He had some success in the pastoral song, but after all he remains noteworthy chiefly as an exceedingly facile improviser, who also possessed a very lively fancy. Consult: his *Opere poetiche* (10 vols., Parma, 1779), which contains his *Memorie storiche e letterarie*; the *Poesie dell' abate C. I. Frugoni* (15 vols., Lucca, 1779-80), the most nearly complete edition; a good selection from his verse in Carducci, *Poeti erotici del sec. XVIII.* (Florence, 1878); some *Lettere inedite*, published by Bertoldi (Forlì, 1891), and others published by Mazzatinti (ib., 1892); the biography in Fabroni, *Vita*, vol. i. (1778-1805); Torelli, "C. I. Frugoni," in his *Pasaggi e profili* (Florence, 1861).

FRUIN, froin, ROBERT (1823-99). A Dutch historian, born in Rotterdam. He was educated at Leyden, where he was appointed professor of the history of the Netherlands in 1860. He was editor of the *Nijhoff's Bijdragen voor Vaderlandsche Geschiedenis*, and was a frequent contributor to *De Gids*, and other publications. He

was regarded as the greatest living authority on Dutch history, and his work entitled *Tien jaren uit den tachtigjarigen oorlog* (4th ed. 1889) is considered one of the best historical works of modern times. His *Reply to Sir Bartle Frere*, and an *Appeal to the People of England* (1881) relative to the Transvaal question, created considerable comment. Another of his publications is *Geschiedenis der staatsinstellingen in Nederland tot den val der republiek* (1901). His *Uerspreide Geschriften* were published by Block. P. L. Müller, and S. Müller in 1900.

FRUIT (OF., Fr. *fruit*, Lat. *fructus*, fruit, from *fruit*, to enjoy). The structure that ripens in connection with the seeds in the spermatophytes (seed-plants). In popular application the term is also used in connection with the sporogonium of mosses, and the sori of ferns (q.v.); but it is misapplied in these senses. The structures of seed-plants included in the fruit are exceedingly variable. In typical cases the fruit is the ripened ovary, as in ordinary pods, the transformed wall being called the pericarp; in apples it includes floral structures outside of the ovary; in strawberries it consists in the main of a very much enlarged receptacle; while in pineapples it is the whole inflorescence. So variable are fruits in structure that it is difficult to classify them satisfactorily, and it is not profitable to give a complete list of the numerous and often pedantic terms which have been applied to them. It will be sufficient to describe the principal forms. It seems to be most convenient to divide fruits into two great divisions, Dry Fruits and Fleshy Fruits.

DRY FRUITS. Dry fruits either open (dehiscent) in various ways to discharge their seeds, or they contain but a single seed, which accompanies the fruit in the dispersal. The dry fruits, therefore, naturally fall into two groups: (1) those which are dehiscent, and (2) those which are indehiscent. Such fruits also consist of the ripened ovary, and therefore have a strict morphological boundary. (1) *Dehiscent fruits* have received the general name of 'pods,' and are grouped on the basis of the number of carpels they contain and the method of dehiscence. The prominent forms are as follows: *Follicle*, a pod consisting of a single carpel, and dehiscing by splitting down the inner side, as in the peony. *Legume*, a pod consisting of a single carpel, and dehiscing by splitting down both sides into two pieces or valves, as in the common pea and bean. Very frequently legumes are simply spoken of as pods, and they are so characteristic of the great pea family that it has been called the Leguminosæ. *Capsule*, a pod consisting of more than one carpel, and dehiscing variously. The dehiscence is said to be septicial when the carpels separate from one another, and in such case each carpel may split down the inner face as if it were a follicle, as in the genus *Hypericum*. In other cases the carpels do not separate, but each one splits down the back, such dehiscence being called loculicidal, as in iris, evening primrose (*Enothera*), etc. In still other cases there are no slits of dehiscence, but the seeds are discharged through pore-like openings near the summit of the capsule, as in the common poppy. *Silique*, the peculiar pod of the mustard family (*Cruciferae*), which consists of two carpels, and is divided into two chambers by a false parti-

tion, to which the seeds are attached. In dehiscence the two carpels split away as two valves from the membranous partition, which is thus exposed with its attached seeds. *Silicle*, a short silique, which is little if at all longer than broad, as in the common shepherd's-purse (*Capsella*), *Pyxis*, a pod which opens by means of a cap-like lid, as in twinleaf (*Jeffersonia*).

(2) *Indehiscent fruits* mature but a single seed, although they are often derived from an ovary composed of more than one carpel, and the pericarp so closely invests the seed that such fruits are popularly spoken of as seeds. Common illustrations are as follows: *Achene*, or *Akene*, the most common seed-like fruit, characteristic of the great family Compositæ, to which belong the sunflowers, thistles, dandelions, etc. In this family the achene commonly bears at its summit the modified calyx (pappus), which in the form of a tuft of hairs or plumes, bristles, hooks, etc., aids in dispersal by wind or animals. *Caryopsis*, or *Grain*, the peculiar seed-like fruit of the grasses, as maize, wheat, barley, rice, etc. *Nut*, a dry indehiscent fruit, in which the pericarp becomes very hard and bony, as in the acorn, chestnut, beechnut, etc. Very commonly there is associated with the nut a peculiar involucre, as that which forms the cup of the acorn and the characteristic investment of chestnuts and beechnuts.

FLESHY FRUITS. Fleshy fruits are indehiscent, since the flesh is intimately associated with the seeds in their dispersal. It is these fruits which are so variable on account of the different structures which ripen. The most common forms are as follows: *Berry*, a fleshy fruit, which is pulpy throughout, and which has a thin skin, or rind. In this case the fruit is a ripened ovary, and common examples are the grape, currant, gooseberry, tomato, etc. *Hesperidium*, a berry with a leathery rind, as the orange and lemon. *Pepo*, a pulpy fruit with a hard rind, as the pumpkin, squash, melon, and the whole race of gourds. *Drupe* or *Stone-fruit*, in which the pericarp ripens in two layers, an outer pulpy one, and an inner stony one, as the peach, plum, cherry, etc. In these cases the pit or stone is often spoken of as the seed, but it invests the seed, which is the kernel. *Drupelet*, a small drupe, as the individual grains of raspberry, blackberry, mulberry, etc. Drupelets are usually aggregated to form a single fruit, as in the illustrations cited. In the raspberry the fruit is simply an aggregation of drupelets; while in the blackberry and mulberry there is associated with the aggregation of drupelets a fleshy axis. *Pome*, a fleshy fruit in which the pulp is the ripened urn-like outgrowth which surrounds the carpels and bears the sepals, petals, and stamens on its rim. Common illustrations are apple, pear, quince, hawthorne, etc. In these cases the modified ovary is the so-called core.

While this classification is fairly complete, it does not include some of the most familiar fruits. For example, the strawberry is a fruit which consists of a very much enlarged and fleshy receptacle, in which are imbedded numerous minute achenes (pits). The banana is a fleshy fruit, but it dehisces by the pericarp splitting into valves, and hence it is often called a fleshy capsule, which is really a contradiction of terms. Almonds are dry fruits, but they are constructed

exactly like the peach, except that the pulpy layer of the pericarp in the peach is a fibrous layer in the almond. The almonds of the markets correspond to the stone of the peach, being the hard inner layer of the pericarp, investing the seed or edible kernel. The pineapple is a whole inflorescence, in which axis, bracts, flowers, and all have become a mass of luscious pulp.

FRUITS, FOOD VALUE OF. Fruits are eaten fresh, both raw and cooked, dried or evaporated, canned and preserved. They are frequently divided into a number of classes, the edible fruits being mostly pomes, e.g. apple, pear, etc.; stone-fruit, e.g. cherry, plum, etc.; berries, e.g. blueberry, grape, banana, etc.; aggregate fruits, e.g. strawberry, raspberry, pineapple, etc.; hesperidium, e.g. orange, grapefruit, lemon, etc.; syconium, e.g. fig. A large class of edible fruits, such as tomatoes and melons, are more commonly spoken of as vegetables (q.v.), and another as nuts (q.v.). The following table gives the composition of the more common fresh fruits, as well as of a number of dried or evaporated, and canned or preserved fruits:

COMPOSITION OF EDIBLE PORTION OF FRUITS; FRESH, DRIED, AND PRESERVED

FRUITS	Water	Protein	Fat	Carbohy- drates	Ash	Fuel value per pound
FRESH	Per cent.	Per cent.	Percent.	Per cent.	Percent.	Calories

These figures represent average values; individual specimens will vary greatly from the average. Many fruits contain more or less inedible material or refuse, such as stems, seeds, pit, etc., while others are entirely edible. The inedible portion may be considerable; thus, in oranges the skin and seeds amount to about 27 per cent. In bananas the skin constitutes about 35 per cent. of the fruit as purchased.

On the other hand, the inedible portion may be very small. Thus the pits of cherries or the hulls of strawberries constitute about 5 per cent. of the weight of the fruit. It will be seen in general that fruits have a high water content. Carbohydrates, which include starches, sugars, and similar bodies, make up the principal nutritive material. In general, fruits contain very little protein or fat. An exception is the alligator pear, which contains about ten per cent. of fat. The ash content of fruits is also small. The ash is made up of salts of calcium, potassium, magnesium, sodium, etc. For instance, the ash of one sample of cherries, which constitutes about 0.6 per cent. of the total fruit, contained 4.2 per cent. of calcium oxide, 57.7 of potassium oxide, 5.5 of magnesium oxide, 15.1 of phosphoric acid, 6.8 of sodium oxide, and 5.8 of sulphuric acid. The ash of three samples of figs (also constituting some 0.6 per cent. of the total fruit) contained an average of 2.4 per cent. of calcium oxide, 55.8 of potassium oxide, 5.6 of magnesium oxide, 12.4 of phosphoric acid, and 3.9 per cent. of sulphuric acid. In the ash of

five samples of grapes (which makes up 0.5 per cent. of the fruit) there was an average percentage of 5 calcium oxide, 50.9 potassium oxide, 3 magnesium oxide, 21.2 phosphoric acid, and 4.3 sulphuric acid.

Dried or evaporated fruits contain much more nutritive material in proportion to their bulk than do the fresh fruits, owing to the fact that, like other dried fruits, they have been concen-

trated by evaporation. Canned or preserved fruits are, generally speaking, cooked fruits, with or without the addition of sugar. Fruits owe their flavors to the presence of esters, acids, volatile oils, salts, and other chemical bodies. The coloring is due to the presence of erythophyll and other complicated chemical compounds. In food analysis such materials are not estimated separately. The total amount is not large, and such bodies are generally included under the carbohydrates, or, as the group is frequently termed, the nitrogen-free extract. The flavor, appearance, and composition of fruits may be modified by cultivation.

Little is known of the digestibility of fruits, that is, the amount of material which they give up to the body in their passage through the digestive tract. It seems fair to assume that they are quite thoroughly assimilated. Over-indulgence in fruit and the consumption of unripe fruit or of that which is more or less decayed, frequently causes pain or other unpleasant symptoms, and there are persons who, because of personal idiosyncrasy, cannot eat certain fruits without distress. Judging by the results of a large number of dietary studies made in the United States, it appears that fruits furnish 5.0 per cent. of the total carbohydrates and about 1 per cent. of the total food, and 4.9 per cent. of the total protein and fat taken together. In many dietary studies which have been made the cost of foods has been recorded. It has been found that a large consumption of fruits or fresh vegetables, owing to their low food content, increases the cost of the diet out of proportion to the nutritive material furnished.

It must not be forgotten, however, that fruits have value in addition to their nutrient value. They contain salts, acids, and other bodies which are believed by physiologists to have a beneficial effect on the system, and doubtless very often stimulate the appetite for other food. They are also useful in counteracting a tendency to constipation. Another point—and one entirely apart from food value—should not be overlooked. That is, fruits add very materially to the attractiveness of the diet. It is not easy to estimate their value from this standpoint, since often the appearance of food has a value which cannot be measured in dollars and cents. For bibliography, see separate articles on various kinds of fruits.

FRUIT, CULTIVATED. Cultivated fruits exhibit great diversity of form, color, texture, flavor, and keeping quality. All are intimately associated with the flower which precedes their formation, and all find their chief use as food for man. The plants that produce them are adapted to great diversity of climate and soil, and may be divided into three main groups—tropical, subtropical, and temperate—depending upon the temperature they require for their perfect development. The leading fruits of the tropics are date, banana, cocoanut, and pineapple; of the subtropics, orange, lemon, fig, pomelo; of the temperate, apple, grape, plum, olive, peach, pear, cherry, strawberry. All of these contribute largely, not only to the diet of the resident populace, but through export, in either the fresh or the preserved state, to the prosperity of the region in which they grow.

The present commercial importance of cultivated fruits is largely due to the developments of

the latter half of the nineteenth century. Prior to that period few fresh fruits other than apples, lemons, oranges, and cocoanuts, and such dried fruits as figs, raisins, and prunes, could be obtained for more than a few consecutive weeks in the general markets of the world, their perishable nature precluding long shipment and exposure previous to sale. During that period the great advances made in quick transportation by sea as well as by land, and the remarkable improvements wrought in methods of canning and evaporating and in holding fresh fruits in edible condition by means of cold storage, have had a wider influence in extending the area devoted to cultivated fruits than improvements in the fruits themselves or in the methods of cultivation. Improved methods of preservation and expeditious transportation have enabled fruit-growers throughout the world to educate the taste and create a demand for fruits in remote regions, with the result that the number of cultivated and even of important wild edible fruits not found either fresh or preserved in the world's principal markets is small indeed, and is becoming steadily smaller. America and Australia ship apples to Europe, which reciprocates by exporting figs, raisins, and the seedless grapes known in commerce as 'currants'; California sends grapes and raisins, citrus fruits, fresh and canned peaches, pears, cherries, and apricots to the States east of the Rocky Mountains; the States bordering the Gulf of Mexico send strawberries, peaches, and other perishable fruits to the North before the Northern season opens; the tropics export bananas, cocoanuts, and pineapples to markets in the temperate zones. Apples, lemons, bananas, and oranges may now be obtained in a fresh state throughout the year, and many other fruits, such as pears, strawberries, grapes, and peaches, that could be obtained for only a few weeks, have had their seasons extended in some instances to as many months. Fruit, fresh or preserved, domestic or exotic, is so generally included in the daily diet of the people of all civilized countries, and the extension of plantations in every country visited by commerce is so active, that the world may be said to be in its fruit age.

If the standing of fruits be determined by the area devoted to each, the consumption of each, and the variety of fruit products of each; the order of sequence in a list of the world's cultivated fruits and their products would probably not vary greatly in a series of years from the following: Apple (evaporated, butter, marmalade, jelly, cider, vinegar, wine, champagne, brandy); grape (wine, vinegar, jelly, argols, or dried as raisins or currants); olive (pickled, oil); lemon; orange (cider, marmalade, candied); cocoanut (dried, oil); banana; peach (canned and dried); plum (canned or dried as prunes); pear (canned, perry); date (dried); fig (dried); strawberry (canned); pineapple (canned); cherry (canned, dried, and candied). If commercial standards, quantity and variety of product, and quick precision in applying scientific discovery and business acumen to fruit-growing and marketing, be employed to determine the standing of a country with respect to its cultivated fruits, the United States stands without a peer; and among the continents, North America ranks first. Immigrants from Europe, who brought with them the

fruits of the fatherland, found the land of their adoption to be rich in new kinds of fruits. The dual list begun by them has been swollen by importations from other regions—Asian, African, Australian, and South American—and now far exceeds in number of species that of any other country. All the fruits of the northern temperate zone, many of the southern and the subtropical, and a few peculiarly tropical may be found in some region of the United States. Europe contributed the apple, pear, and cherry; Asia, the peach, plum, orange, fig, and cocoanut; Africa, the date; South America the navel orange, and so on. America has developed many varieties of the following indigenous fruits which she offers in exchange; e.g. blackberry, raspberry, cranberry, dewberry, grapes, and some gooseberries, plums, and apples, besides innumerable improvements in species already highly developed abroad. Yet she has scarcely made more than a beginning; many fruits, such as the persimmon, papaw, buffalo berry, and prickly pear, have as yet attracted little more than temporary interest, but are acknowledged by horticulturists to be rich in promise of possible amelioration. But this remark is true also of fruits of other regions, especially of fruits indigenous to the tropics, where improved methods of propagation and tillage have made slow progress.

Apart from the business side of fruit-growing already touched upon, the improvements made in the fruits themselves and in fruit culture during the last half of the nineteenth century have resulted mainly from the application of scientific discoveries in plant life. These discoveries and the improvements based upon them may be roughly divided into three general but closely related groups: Ecological (the influence of temperature, moisture, wind, air, drainage, soil); physiological (manuring, tilling, mulching, pollenizing, thinning, pruning, hybridizing, and selecting); parasitical and pathological (the control of animal and plant parasites, and of diseases due to organic disturbances). Concerning these, see MANURES AND MANURING; ECOLOGY; DISTRIBUTION OF PLANTS; TILLAGE; PLANT-BREEDING; PRUNING; MULCH; POLLINATION; CROSS-FERTILIZATION; FUNGI, ECONOMIC; FUNGICIDE; INSECTICIDE; HARVEST AND HARVESTING; IMPLEMENTS, AGRICULTURAL; WIND-BREAK; REFRIGERATION; and articles on the various fruits. Consult, also: Bailey, *Principles of Fruit-Growing* (New York, 1897); article "Pomology," in *Cyclopedia of American Horticulture* (New York, 1900).

FRUIT, FOSSIL. See CARPOLITH.

FRUIT-BAT. Any fruit-eating bat, especially of the Old World tropical family Pteropodidæ, called fox-bats, or flying foxes. These constitute a suborder, Megachiroptera, of the bats, based not only upon their large size, but upon distinctive structural features. The wings of fruit-bats have three, instead of one or two, joints in the second or index finger, which is generally provided with a claw, while the thumb alone of other bats possesses one. The ears are small, lack any inner tragus, and the conch forms a ring at its base; the tail, when present, is short, and beneath and free from the membrane between the hind legs. The teeth are unlike those of ordinary bats, particularly in the molars having

elongated flat crowns, adapted to crushing pulpy fruits, such as the fig and banana, which constitute nearly the entire diet of the group. These bats are regarded as a specialized offshoot from the ordinary type of insectivorous bats. Consult: Thomas, *Proceedings of the Zoölogical Society of London* (London, 1888). See FOX-BAT; HARPY BAT; TUBE-NOSE.

FRUIT-CROW. A name for several South American birds of the family Cotingidæ, and the genera *Gymnocephalus* and *Gymnodora*. They are closely related to the bell-birds and umbrella-birds (q.v.), are crow-like in appearance, and feed upon fruits to a great extent. They possess the baldness or tendency to wattles which characterizes the group, and one or more prominent species are known as 'baldheads.'

FRUIT-FLY. Any small fly of the family Trypetidæ. They are very numerous, and include many species which injure fruit and others that make galls. Most of them are minute, and all are marked with varied colors and spots. Prominent examples are *Trypeta pomonella*, whose larva, the apple-maggot, bores tunnels in apples. Another species, *Ceratitis capitata*, is highly injurious to peaches in the Old World, but is not met with in America. The Morelos orange-worm (see ORANGE-INSECTS) of Mexico is of this family, and others might be named. Consult: Loew, *Monographs of the Diptera of North America*, parts i. and iii. (Washington, 1862-73); Coquillett, "Descriptions of Trypetidæ," in *Journal of the New York Entomological Society* (New York, 1899). See GALL-INSECTS.

FRUIT-PIGEON. A pigeon of the family Treronidæ. They have the bill considerably depressed at the base, compressed and moderately arched at the tip, the membrane in which the nostrils are pierced little prominent or swollen, the forehead low, and the feathers advancing on the soft part of the bill, the wings moderately long, the feet, and particularly the hinder claw, large, and formed for grasping. During the breeding season a curious gristly knob grows on the base of the upper mandible of some of the species, and soon after disappears. They are birds of splendid plumage, natives of the forests of India, the Indian Archipelago, the warmer parts of Australia, the islands of the Pacific Ocean, and one species is found in Africa. There are about 80 species altogether, most of them contained in the genera *Carpophaga* and *Treron*. Their food consists of fruits, which are swallowed whole.

FRUMENTIUS, frōō-mēn'shī-us, SAINT. The apostle of the Abyssinians. About 316 he and his brother Edesius, both young boys, accompanied their uncle Meropius, a Greek philosopher of Tyre, on a trading voyage, or, according to others, a scientific expedition. Landing on the coast of Abyssinia, all were slain by the natives except the two boys, who became slaves in the service of the King. They won the confidence of their master, were raised to important positions, and ultimately were set free. After the death of the monarch, Frumentius became instructor to the young prince Aizanes, and obtained great influence in the administration of State affairs. He formed a church of native converts and Christian merchants who came to

the country. After the prince attained his majority, Edesius returned to Tyre, and became a presbyter. Frumentius went to Alexandria, and informed Athanasius, who had lately been nominated bishop, of the progress he had made in preparing the way for Christianity in Abyssinia, and was consecrated Bishop of Axum (328). After his return he baptized the King and made many converts. He is supposed to have translated the Bible into Ethiopian. Frumentius's day is celebrated by the Latins on October 27th, by the Greeks on November 30th, and by the Abyssinians on December 18th. See *ABYSSINIAN CHURCH*.

FRUNDSBERG, fröonts'bërk, or **FRONS-FEBG**, frôn'spërk, GEORG VON (1473-1528). A German soldier, called the "Father of the German *Landknechte*" (foot-soldiers or pikemen). He was born at the Castle of Mindelheim, Swabia, and received his military training in the wars of the House of Hapsburg against Switzerland, and in the Italian campaign between the League of Cambrai and Venice. In 1519 he was appointed commander-in-chief of all the infantry troops of the Swabian League. He also fought with distinction at the battle of Pavia (1525), and contributed greatly to the development of the famous German *Landknechte*, a military body which continued to take a prominent part in the European campaigns until the termination of the Thirty Years' War.

FRUSTUM. See *CONE*.

FRY, Sir EDWARD (1827-). An English jurist, born at Bristol, and educated at the college there and at University College, London. He was appointed judge of High Court, Chancery Division, in 1877, and was knighted in the same year. He was judge of the Court Appeal from 1883 to 1892, and in 1897 was president of the Royal Commission on the Irish Land Acts. In 1901 he became a member of the Permanent Court of Arbitration at The Hague. In his writings he displays considerable versatility: *Essays on the Accordance of Christianity with the Nature of Man* (1857); *A Treatise on the Specific Performance of Contracts* (3d ed. 1892); *British Mosses* (1892); *The Mycetozoa* (with Miss Agnes Fry, 1899); *Studies by the Way* (1900).

FRY, ELIZABETH (1780-1845). An English Quaker minister and prison reformer, born at Earlsam, Norfolk, daughter of John Gurney. As a child of fifteen, Elizabeth Fry became deeply interested in the house of correction at Norwich. In 1813 she first became practically engaged in prison reform, and turned her attention to the condition of women prisoners at Newgate. Under her leadership an association was formed in 1817 for the improvement of these unfortunates, and did much to better their condition materially and morally. Mrs. Fry also joined in the movement to induce the Government to make proper regulations for the voyage of convicts, at that time transported to New South Wales, and to make provision for their employment at the end of their voyage. She extended her activities throughout England, traveled from place to place, and founded prison associations. Her work attracted attention in other countries, also; and contributed materially to prison reform on the Continent. She wrote several works of minor importance. For the story of her life, consult the *Memoirs*, edited by her two daughters (2 vols., London,

1847); *Memoirs*, by Thomas Thompson (London, 1847); a *Life*, compiled from her journal by Susanna Corder (London, 1853); Timpson, *Memoirs of the Life of Mrs. Fry* (London, 1847).
